PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

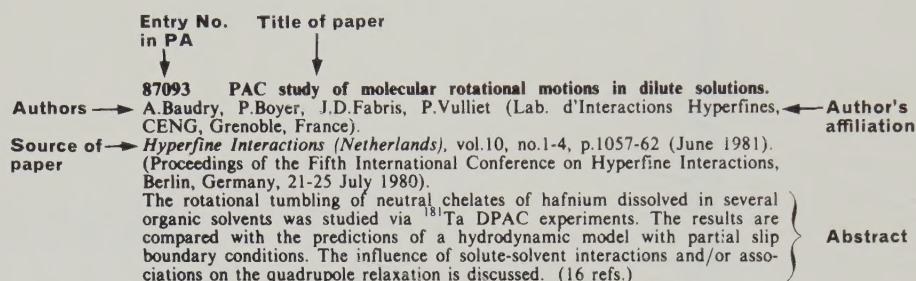

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

1340F Electromagnetic form factors; electric and magnetic moments	8948	2585 Fission reactions	8972
1340H Electromagnetic decays	8948	2588 Fusion reactions	8973
1340K Electromagnetic corrections to strong and weak interaction processes	8949	2590 Other topics in nuclear reactions and scattering: specific reactions	—
1360 Photon and charged-lepton interactions with hadrons	8949		
1360F Elastic and Compton scattering	8949	2700 PROPERTIES OF SPECIFIC NUCLEI LISTED BY MASS RANGES	8973
1360H Total and inclusive cross sections	8949	2710 $A \leq 5$	8973
1360K Meson production	—	2720 $6 \leq A \leq 19$	8973
1360M Meson-resonance production	—	2730 $20 \leq A \leq 38$	8974
1360P Baryon and baryon resonance production	8949	2740 $39 \leq A \leq 58$	8974
1365 Hadron production by electron-positron collisions	8949	2750 $59 \leq A \leq 89$	8974
1375 Hadron-induced low- and intermediate-energy reactions and scattering, energy ≤ 10 GeV	8950	2760 $90 \leq A \leq 149$	8975
1375C Nucleon-nucleon interactions, including antinucleon, deuteron, etc. (energy ≤ 10 GeV)	8950	2770 $150 \leq A \leq 189$	8975
1375E Hyperon-nucleon interactions (energy ≤ 10 GeV)	—	2780 $190 \leq A \leq 219$	8975
1375G Pion-baryon interactions (energy ≤ 10 GeV)	—	2790 $220 \leq A$	8975
1375J Kaon-baryon interactions (energy ≤ 10 GeV)	—		
1375L Meson-meson interactions (energy ≤ 10 GeV)	—	2800 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES	8976
1385 Hadron-induced high- and super-high-energy interactions, energy > 10 GeV	8950	2820 Neutron physics	8976
1385D Elastic scattering (energy > 10 GeV)	8950	2841 Fission reactor theory and design	8976
1385F Inelastic scattering, two-particle final states (energy > 10 GeV)	—	2842 Fission reactor materials	8977
1385H Inelastic scattering, many-particle final states (energy > 10 GeV)	8950	2842H Fuel preparation and reprocessing	8980
1385K Inclusive reactions, including total cross sections, (energy > 10 GeV)	8950	2843 Fission reactor operation	8980
1385M Cosmic ray interactions	—	2844 Fission reactor protection systems, safety and accidents	8983
1388 Polarisation in interactions and scattering	8950	2850 Fission reactor types and applications	8986
1390 Other topics in specific reactions and phenomenology of elementary particles	8951	2852 Fusion reactors	8986
		2858 Integrated reactor systems	8987
1400 PROPERTIES OF SPECIFIC PARTICLES AND RESONANCES	8951	2870 Nuclear explosions	8988
1420 Baryons and baryon resonances	8951	2880 Radiation technology, including shielding	8988
1440 Mesons and meson resonances	8951	2890 Other topics in nuclear engineering and nuclear power studies	8989
1460 Leptons	8951		
1480 Other and hypothetical particles	8951	2900 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS	8989
2000 NUCLEAR PHYSICS	8952	2910 Preacceleration (injection)	8989
2100 NUCLEAR STRUCTURE	8952	2915 Electrostatic and linear particle accelerators	8989
2110 General and average properties of nuclei; properties of nuclear energy levels	8952	2920 Cyclic accelerators and storage facilities	8991
2110D Binding energy and masses	8953	2925 Particle sources and targets, preparation and technology	8991
2110F Shape, charge, radius and form factors	8953	2930 Radiation spectrometers and spectroscopic techniques	8993
2110H Spin, parity, and isobaric spin	8954	2940 Radiation detectors	8994
2110J Spectroscopic factors	8955	2960 Counting circuits and nuclear electronics	8997
2110K Electromagnetic moments	8955	2970 Radiation measurement, detection and counting	8998
2110M Level density and structure	8955	2975 Polarization analysis	—
2130 Nuclear forces	8955	2980 Nuclear information processing	8999
2140 Few-nucleon systems	8956	2990 Other topics in high-energy and nuclear experimental methods and instrumentation	8999
2160 Nuclear-structure models and methods	8956		
2160C Shell model	8956	3000 ATOMIC AND MOLECULAR PHYSICS	8999
2160E Collective models	8957		
2160F Models based on group theory	8957	3100 THEORY OF ATOMS AND MOLECULES	8999
2160G Cluster models	8958	3110 General theory of structure, transitions and chemical binding	8999
2160J Hartree-Fock and random-phase approximations	8958	3115 General mathematical and computational developments	9000
2165 Nuclear matter	8958	3120 Specific calculations and results	9000
2180 Hypernuclei	8958	3120D Complete <i>ab initio</i> calculations (exact or nearly exact calculations on small species)	—
2190 Other topics in nuclear structure	—	3120E <i>Ab initio</i> LCAO and GO SCF calculations	—
2300 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS	8958	3120G Other accurate, or nearly <i>ab initio</i> calculations (DIM method, SAMO method, etc.)	9002
2320 Electromagnetic transitions	8958	3120L Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)	9002
2320C Lifetimes and transition probabilities	8959	3120N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)	9002
2320N Internal conversion and extranuclear effects	8960		
2340 beta decay; electron and muon capture	8960		

3120P	Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)	9003	3500	PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES	9021
3120R	Valence bond calculations (ab initio or not)	9003	3510	Atoms	9021
3120T	Electron correlation and CI calculations	9003	3510B	Atomic masses, mass spectra, abundances, and isotopes	9021
3120W	Empirical methods (nonquantum methods for conformations, as Wiberg method, Westheimer method, etc.)	—	3510D	Electric and magnetic moments, polarizability	9021
3130	Corrections to electronic structure	9004	3510F	Relativistic corrections, fine- and hyperfine-structure constants	9021
3150	Excited states	9004	3510H	Ionization potentials, electron affinities	9021
3170	Effects of molecular interactions on electronic structure	9005	3510W	Weak Interactions	9021
3170D	Environmental and solvent effects	9005	3520	Molecules	9021
3170F	Potential-energy surfaces for collisions	9005	3520B	General molecular conformation and symmetry; stereochemistry	9021
3170H	Time-dependent phenomena: excitation and relaxation processes, and reaction rates	—	3520D	Interatomic distances and angles	9022
3170K	Molecular solids	—	3520G	Bond strengths, dissociation energies, hydrogen bonding, etc	9022
3190	Other topics in the theory of atoms and molecules	9005	3520J	Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics	9022
3200	ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS	9005	3520M	Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility	9023
3220	Atomic spectra grouped by wavelength ranges	9005	3520P	Rotation, vibration, and vibration-rotation constants	9023
3220B	Radiofrequency, microwave, and infrared spectra	9005	3520S	Hyperfine and fine-structure constants	9023
3220J	Visible and ultraviolet spectra	9005	3520V	Ionization potentials, electron affinities, molecular core binding energy	9023
3220R	X-ray spectra	9005	3520W	Weak interactions	—
3250	Fluorescence, phosphorescence	9005	3520X	Mass spectra	9023
3260	Zeeman and Stark effects	9005	3520Y	Correlation times in molecular dynamics	—
3270	Spectral line shapes and intensities	9006	3580	Atomic and molecular measurements and techniques	9023
3280	Photon interactions with atoms	9006			
3280B	Level crossing and optical pumping	9006			
3280D	Autoionization	—			
3280F	Photoionization and photodetachment	9006	3600	STUDIES OF SPECIAL ATOMS AND MOLECULES	9024
3280H	Auger effect and inner-shell ionization	—	3610	Exotic atoms and molecules (containing mesons, muons, and other abnormal particles)	9024
3280K	Multiphoton processes	—	3620	Macromolecules and polymer molecules	9024
3290	Other topics in atomic spectra and interactions with photons	9006	3640	Atomic and molecular clusters	9025
			3690	Other special atoms and molecules	—
3300	MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS	9006	4000	CLASSICAL AREAS OF PHENOMENOLOGY	9025
3310	Calculation of molecular spectra	9006			
3320	Molecular spectra grouped by wavelength ranges	9008	4100	ELECTRICITY AND MAGNETISM; FIELDS AND CHARGED PARTICLES	9025
3320B	Radiofrequency and microwave spectra	9008	4110	Classical electromagnetism	9025
3320E	Infrared spectra	9009	4110D	Electrostatics, magnetostatics	9025
3320F	Raman and Rayleigh spectra	9010	4110F	Steady-state electromagnetic fields; electromagnetic induction	9025
3320K	Visible spectra	9010	4110H	Electromagnetic waves: theory	9025
3320L	Ultraviolet spectra	9011	4170	Particles in electromagnetic fields: classical aspects	9026
3320N	Vacuum ultraviolet spectra	—	4180	Particle beams and particle optics	9027
3320R	X-ray spectra	—	4180D	Electron beams and electron optics	9027
3325	Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR)	9011	4180G	Ion beams and ion optics	9027
3330	Electron paramagnetic resonance and relaxation	9011	4190	Other topics in electricity and magnetism	—
3335	Double resonances and other multiple resonances	9012			
3335H	MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)	9012	4200	OPTICS	9027
3340	Mössbauer spectra	9012	4210	Propagation and transmission in homogeneous media	9027
3345	Magneto-optical and electro-optical spectra; dichroism	9012	4220	Propagation and transmission in inhomogeneous media	9028
3345B	Zeeman and Stark effects	9012	4230	Optical information, image formation and analysis	9029
3345C	Magnetic circular dichroism	9012	4240	Holography	9030
3350	Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion)	9013	4250	Quantum optics	9030
3365	Photoelectron spectra	9014	4252	Masers	9031
3370	Intensities and shapes of molecular spectral lines and bands	9014	4255	Lasing processes	9031
3380	Photon interactions with molecules	9015	4255B	General theory of lasing action	9031
3380B	Level crossing and optical pumping	9015	4255D	CO ₂ lasers	9031
3380E	Autoionization, photoionization, and photodetachment	9015	4255F	Inert gas lasers	9031
3380G	Diffuse spectra; predissociation, photodissociation	9015	4255H	Lasing action in other gas lasers	9031
3380K	Multiphoton processes	9015	4255K	Chemical lasers	9032
3390	Other topics in molecular spectra and interactions with photons	—	4255M	Lasing action in liquids and organic dyes	9032
			4255P	Lasing action in semiconductors with junctions	9032
3400	ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS	9016	4255R	Lasing action in other solids	9033
3410	General theories and models	9016	4255T	Free electron lasers	9033
3420	Interatomic and intermolecular potentials and forces	9016	4260	Laser systems and laser beam applications	9033
3440	Elastic scattering of atoms and molecules	—	4260B	Design of specific laser systems	9033
3450	Inelastic scattering of atoms and molecules	9016	4260D	Laser resonators and cavities	9034
3450E	Rotational and vibrational energy transfer	9017	4260F	Laser beam modulation	9034
3450H	Electronic excitation and ionization (inc. beam-foil excitation and ionization)	9018	4260H	Optical problems related to properties and interactions of laser beams	9035
3450L	Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams	9019	4265	Nonlinear optics	9035
3470	Charge transfer	9019	4265B	General theory	9036
3480	Electron scattering	9020	4265C	Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation	9036

7820D	Optical constants and parameters	9186	8140E	Cold working, work hardening; annealing, recovery and recrystallisation; textures	9218
7820E	Optical rotatory power	9187			
7820F	Birefringence	9187	8140G	Other heat and thermomechanical treatments	9219
7820H	Piezo-, elasto- and acousto-optical effects	9188	8140J	Elasticity and anelasticity	9220
7820J	Electro-optical effects	9188	8140L	Deformation, plasticity and creep	9221
7820L	Magneto-optical effects	9188	8140N	Fatigue, embrittlement, and fracture	9225
7820N	Thermo-optical effects	—	8140P	Friction, lubrication, and wear	9230
7830	Infrared and Raman spectra and scattering	9188	8140R	Electrical and magnetic properties (related to treatment conditions)	9231
7835	Brillouin and Rayleigh scattering	9191	8140T	Optical properties (related to treatment conditions)	9231
7840	Visible and ultraviolet spectra	9191	8160	Corrosion, oxidation and surface treatments	9231
7845	Stimulated emission	9192	8160B	Metals and alloys	9233
7850	Impurity and defect absorption in solids	9192	8170	Materials testing	9237
7855	Photoluminescence	9193	8190	Other topics in materials science	9240
7860	Other luminescence spectra and radiative recombination	9196			
7860F	Electroluminescence	9196	8200	PHYSICAL CHEMISTRY	9241
7860H	Cathodoluminescence, ionoluminescence	9196	8220	Chemical kinetics	9241
7860K	Thermoluminescence	9197	8220K	Potential energy surfaces for chemical reactions	9241
7860M	Sonoluminescence, triboluminescence	—	8220M	Nonequilibrium kinetics	9241
7860P	Chemiluminescence	—	8220R	Energy distribution and transfer, relaxation	—
7865	Optical properties of thin films	9197	8230	Specific chemical reactions; reaction mechanisms	9241
7870	Other interactions of matter with particles and radiation	9198	8235	Polymer reactions and polymerization	9244
7870B	Positron annihilation	9198	8240	Chemical kinetics and reactions: special regimes	9244
7870C	X-ray scattering	9199	8240D	Atomic and molecular beam reactions	—
7870D	X-ray absorption and absorption edges	9199	8240T	Chemiluminescence and chemical laser kinetics	9245
7870E	X-ray emission threshold and fluorescence	9199	8245	Electrochemistry and electrophoresis	9245
7870G	Microwave and radiofrequency interactions	9199	8250	Photochemistry and radiation chemistry	9245
7890	Other topics in optical properties of condensed matter and other interactions of matter with particles and radiation	—	8250E	Photodissociation, photoionization as studied by luminescence and radiationless transitions	—
			8255	Radiochemistry	9246
			8260	Chemical thermodynamics	9246
			8265	Surface processes	9246
			8270	Disperse systems	9247
7900	ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA	9200	8280	Chemical analysis and related physical methods of analysis	9248
7920	Impact phenomena	9200	8290	Other topics in physical chemistry	—
7920D	Laser-light impact phenomena	9200			
7920F	Electron impact: Auger emission	9200	8600	ENERGY RESEARCH AND ENVIRONMENTAL SCIENCE	9249
7920H	Electron impact: secondary emission	—	8610	Energy resources and their utilisation	9249
7920K	Other electron impact phenomena	9200	8610B	Fossil and other fuels	—
7920N	Atom, molecule, and ion impact	9201	8610D	Wind energy	9249
7920R	Atomic and molecular beam interactions	9202	8610F	Tidal and flow energy	9249
7940	Thermionic emission	9202	8610H	Geothermal energy	—
7960	Photoemission and photoelectron spectra	9202	8610K	Solar energy	9249
7970	Field emission and field ionization	9203	8610N	Nuclear energy	—
7975	Exoelectron emission	—	8610Z	Other topics	—
7980	Resonance tunnelling	9204	8630	Energy conversion	9250
7990	Other topics in emission and impact phenomena in condensed matter	—	8630D	Electrochemical conversion: general	9250
			8630E	Primary cells	9250
8000	CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY	9204	8630F	Secondary cells	9250
8100	MATERIALS SCIENCE	9204	8630G	Fuel cells	9251
8110	Methods of crystal growth and purification	9204	8630J	Photoelectric conversion: solar cells and arrays	9251
8110B	Growth from vapour	9204	8630K	Photoelectrochemical conversion	9253
8110D	Growth from solutions	9204	8630L	Electrostatic and magnetohydrodynamic conversion	9253
8110F	Growth from melts	9204	8630M	Thermoelectric conversion	—
8110H	Zone melting and zone refining	9205	8630N	Thermionic conversion	—
8110J	Growth from solid phases	9205	8630P	Photosynthesis	—
8115	Methods of thin film deposition	9205	8630Q	Chemical energy conversion	9253
8115C	Deposition by cathodic sputtering	9205	8630R	Thermal energy conversion (heat engines and heat pumps)	9253
8115G	Vacuum deposition	9206	8630S	Photothermal conversion	9254
8115H	Chemical vapour deposition	9206	8630Z	Other topics	9255
8115J	Ion plating and other vapour deposition	9209	8640	Energy storage (secondary energy)	9255
8115L	Deposition from liquid phases (melts and solutions)	9210	8640C	Storage in mechanical energy	—
8120	Other methods of preparation of materials	9210	8640F	Storage in thermal energy	9255
8120C	Vacuum methods	—	8640H	Storage in chemical energy	—
8120E	Powder techniques, compaction and sintering	9211	8640K	Hydrogen storage and technology	9256
8120G	Specific metals and alloys (compacts, pseudoalloys)	9212	8640Z	Other topics	—
8120J	Dispersion-fibre-, and platelet-reinforced metal-based composites	9213	8660	Requirement for energy: ecological aspects	—
8120L	Ceramics and refractories	9213	8670	Environmental science	9256
8120N	Cermets, ceramic and refractory composites	9214	8670C	Soil	9256
8120P	Glasses	9214	8670E	Water	9256
8120Q	Glass-based composites, vitroceraics	—	8670G	Atmosphere	9256
8120S	Polymers	9214	8670J	Noise	—
8120T	Reinforced polymers and polymer-based composites	9214	8670L	Measurement techniques in environmental science	9257
8130	Phase diagrams and microstructures developed by solidification and solid-solid phase transformations	9214	8670Z	Other topics	9257
8130B	Phase diagrams of metals and alloys	9214	8690	Other topics in energy research and environmental science	—
8130D	Phase diagrams of other materials	9215	8700	BIOPHYSICS, MEDICAL PHYSICS, AND BIOMEDICAL ENGINEERING	9257
8130F	Solidification	9215	8710	General, theoretical, and mathematical biophysics	9257
8130H	Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder	9216	8715	Molecular biophysics	9258
8130K	Martensitic transformations	9216	8715B	Structure, configuration, conformation, and active sites at the biomolecular level	9258
8130M	Precipitation	9217	8715M	Interactions with radiations at the biomolecular level	9259
8140	Treatment of materials and its effects on microstructures and properties	9217	8716	Biothermics	9260
8140C	Solid solution hardening, precipitation hardening, dispersion hardening	9218	8720	Membrane biophysics	9260
			8725	Cellular biophysics	9261
			8725D	Biological transport; cellular and subcellular transmembrane physics	9262
			8730	Biophysics of neurophysiological processes	9262

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

	Classification		Classification		Classification
A mesons	1440	Atomic polarisability	3510D	Boson systems	0530
Ab initio calculations	3120	Atomic spectra	32	Boundary layer flow	4715C, 4725F
Aberrations	4180, 4230, 4278	Atomic structure	31, 3510	Boundary layer turbulence	4725F
Abrasion	4630P, 6220P, 8140P	Atomic transitions	3110	Brain	87
Absorptive models	1240P	Atoms	30	Bremsstrahlung	0350, 41, 7870
Acceleration measurement	0630G	Audition	8734	Brillouin spectra	3320F, 4265C, 5170, 7835
Accumulation layers	7320, 7340Q	Auger effect	3280H, 7920F, 7920N, 7960, 8260	Brillouin zones	6320, 7125
Acoustic devices	4385	Aurora	9410S	Brink model	2160G
Acoustic holography	4363	Autoionisation	3280D, 3380E	Brittleness	4630N, 6220M, 8140N
Acoustic noise	4350, 4360, 4388, 8670J	Axial vector currents	1140	Brownian motion	0540
Acoustic nuclear magnetic resonance	7660	Axiomatic field theory	1110	Bubble chambers	2940
Acoustic paramagnetic resonance	7630			Buckling	4630L, 6220F, 8140L
Acoustic properties of gases	5140				
Acoustic properties of liquids	6260				
Acoustic properties of solids	6265				
Acoustic signal processing	4360				
Acoustic wave propagation	4320, 4325, 5140, 6260, 6265				
Acoustics	43	B mesons	1440	C invariance	1130
Acousto-optical effects	5140, 5170, 7820H	Background radiation	9870V	Calibration	0620H
Acoustoelectric effects	4388, 5140, 5150, 7250	Band model of magnetism	7510L	Calorimetry	0720F
Adaptive optics	42	Band structure	7125	Cameras	0768
Adherence	4630P	Barkhausen effect	7560E	Capillarity	6810
Adhesion	4630P, 6825, 8190	Barrier heights	3520J	Carbon dioxide lasers	4255D, 4260
Adsorption	6845, 8265	Baryon-baryon interactions	1375C, 1375E, 1385	Cardiology	87
Aerodynamics	4740	Baryon-baryon scattering	1375C, 1375E, 1385	Carrier density	7220
Aeroelasticity	4630C, 4630M	Baryon decays	1330	Carrier lifetime	7220J
Aeronomy	94	Baryon electric moment	1340F, 1420	Carrier mobility	7220
Aerosols	4755K, 8270, 92	Baryon-kaon interactions	1375J, 1385	Casting	8120, 8130F
Aerospace	9480, 9555	Baryon-kaon scattering	1375J, 1385	Catalogues	9585
Aerospace biophysics	8765	Baryon magnetic moment	1340F, 1420	Cathodochromism	7820
Ageing	8140Q	Baryon mass	1420	Cathodoluminescence	7860H
Airglow	9410Q	Baryon parity	1420	Cavitation	4755B
Algebra	0210	Baryon-pion interactions	1375G, 1385	Celestial mechanics	0320, 9510C
Alpha decay	2360	Baryon-pion scattering	1375G, 1385	Cells (electric)	8630D
Alpha particle-nucleus reactions	2560	Baryon production	1360P, 1365, 1375, 1385	Cellular biophysics	8725
Alpha particle-nucleus scattering	2560	Baryon resonance production	1360P, 1365, 1375, 1385	Ceramic preparation	8120L, 8120N
Alpha particle spectroscopy	2930	Baryon resonances	1420	Ceramics	81
Alpha particles	2140, 2710	Baryon spin	1420	Cermets	81
Amorphous semiconductors	6140, 7125M, 7220, 7280N	Baryons	1420	CESR	7630P
Amorphous state	6140, 81	BCS theory	2160, 7420F	Chalcogenide glasses	6140D, 7280N
Anderson model	7110, 7125M, 7155	Beam-foil excitation	3450H	Channel flow	4760
Anelasticity	4630J, 6240, 8140J	Beam-foil ionisation	3450H	Channelling	6180M
Anemometers	4780, 9385	Beam handling equipment	2925	Chaos	0540
Angular measurement	0630C	Beam handling techniques	2925	Charge density waves	7145, 7215N
Annealing	8140E, 8140G	Bending	4630J, 6220F, 8140L	Charge exchange	3470
Anodisation	8160, 8245	Beta decay	2340	Charge ordered states	7145, 7150
Antiferromagnetism	7530	Beta ray spectroscopy	2930	Charge transfer	3470
Antiferroelectric materials	7780	Betatrions	2920	Charge transfer reactions	8230
Antiferromagnetic properties of substances	75, 7550E	Bethe-Salpeter equations	1110	Charge transfer states	31, 7170C
Antiferromagnetic resonance	7650	Bi-metric gravity theories	0450	Charm particles	1420, 1440
Antiphase boundaries	81	Bibliographies	0130T	Chemical analysis	8280
Antiphase domains	81	Binary stars	9780	Chemical binding	3110, 3520G
Antireflection coatings	4270, 4278H, 4280	Binding energy	31, 3520V, 6150L	Chemical energy conversion	8630Q
Appearance potential spectroscopy	0785, 7870E	Bio-optics	8750E, 8760G	Chemical energy storage	8640H
APW calculations	7110, 7125C	Bioacoustics	8738, 8750B, 8750C, 8760B	Chemical kinetics	8220
Architectural acoustics	4355	Biocommunications	87	Chemical lasers	4255K, 4260, 8240
Artificial limbs	8770J	Biocontrol	8710	Chemical reactions	3450L, 8230, 8235, 8240
Artificial organs	8770J	Biocybernetics	8710	Chemical shifts	3325, 7660C
Association	6120, 6125, 8230	Bioelectric phenomena	8730, 8732E	Chemical thermodynamics	8260
Asteroids	9630H	Bioenergy conversion	8630Z	Chemical vapour deposition	6855, 8115H
Astroarchaeology	9590	Biography	0150	Chemiluminescence	5170, 7860P, 8240
Astrometry	95, 9555	Biological effects of radiation	8750	Chemoception	8738
Astronomical instruments	95	Biological fluid dynamics	8745	Chemisorption	6845, 8265
Astronomy and astrophysics	95, 96, 97, 98	Biological techniques and instruments	8780	Cherenkov detectors	2940
Atlases	9585	Biology	87	Cherenkov radiation	41

01.00 COMMUNICATION, EDUCATION, HISTORY, AND PHILOSOPHY

01.30 PHYSICS LITERATURE AND PUBLICATIONS

01.30B Publications of lectures (advanced institutes, summer schools, etc.)

111295 Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure. New York, USA: Plenum Press (1983), ix+301 pp. [0 306 41341 8] Conference held at: Dronten, Netherlands. Date 16-28 Aug. 1982. Sponsors: NATO; Netherlands' Min. Educ. & Sci.; Found. Physica; Netherlands' Phys. Soc. The following topics were dealt with: electromagnetic and weak currents in nuclei; unification of weak and electromagnetic forces; breaking of fundamental symmetries in nuclei; microscopic basis of collective symmetries; symmetry aspects of the shell model; energy of a nucleon in a nucleus; general principles of statistical spectroscopy; search for neutrino masses and oscillations; electron scattering; Δ dynamics; and parity non-conservation in muonic He atoms.

01.30C Conference proceedings

111296 Workshop on Positron-Electron Pairs in Astrophysics. AIP Conf. Proc. (USA), no.101 (1983). Conference held at: Greenbelt, MD, USA. Date Jan. 1983. The following topics were dealt with: solar flare gamma ray lines, positron annihilation spectra, cosmic gamma ray burst energy spectra, burst optical counterparts, fireball model, pulsars, pair production, galactic centre, Galaxy, Sun, supernovae, active galaxies, galactic nuclei, X-ray background, black holes, accretion discs, plasmas, relativistic winds, magnetic fields, radio stars, polar regions, spinless hadron pairs and proton exchange.

111297 Proceedings of Helsinki International Summer School on Semiconductors 1982. Acta Polytech. Scand. Electr. Eng. Ser. (Finland), no.EL50 (1983). Conference held at: Espoo, Finland. Date 14-18 June 1982. The following topics were dealt with: small devices; noncrystalline semiconductors; dynamical conductivity and dielectric function; hot carrier physics and higher order electron phonon dynamics; electronic correlations in magnetic semiconductors and functional integral approach to Hubbard model; dielectric semiconductor systems; electronic transport in tetrahedral amorphous semiconductors; magnetic ordering phenomena in rare earth semiconductors. 8 papers were presented, of which 7 are published in full in the present proceedings, and 1 as abstract only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111298 Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications. Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1 (1983). Conference held at: College Station, TX, USA. Date 4-6 Nov. 1982. The following topics were dealt with: magnetically confined fusion; multicharged ion interactions with hydrogen; inner shell ionisation; deuterium-induced L-shell X-ray production; L-shell Coulomb ionisation; L-shell ion-input ionisation; direct ionisation and capture in inner-shell processes; K-shell ionisation and capture by light ions; charge change in atomic collisions; charge transfer from molecules to bound and continuum states; ion-atom collisions; impact parameter dependence of electron capture; long-range couplings in collisional charge transfer; collisions involving hydrogen atoms; spectra of np-1s transitions excited during the passage of the Mg ions through carbon targets; ion induced electron ejection from solids; and electron-ion collision of fusion interest. Abstracts of individual papers can be found under the relevant classification codes in this or other issues.

111299 Metallogeny and Tectonics of the North American Cordillera GAC/MAC/CGU Symposium. Can. J. Earth Sci. (Canada), vol.20, no.6 (1983). Conference held at: Calgary, Alta., Canada. Date 13 May 1981. The following topics were dealt with: displaced terrains, metal deposits in British Columbia, and mineral deposits in the United States and Mexico.

111300 1st European Conference on Cineradiography with Photons or Particles. Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312 (1983). Conference held at: Paris, France. Date 18-21 May 1981. Sponsors: CEA. The following topics were dealt with: cineradiography in technology; cineradiography in experimental physics; cineradiography in biophysics; image processing-3D reconstruction; X-ray and particle generators; image detectors and cameras. 40 papers were presented, of which 39 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111301 SPIE Proceedings on Wavefront Sensing. Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351 (1983). [received: Sept. 1983] Conference held at: San Diego, CA, USA. Date 24-25 Aug. 1982. The following topics were dealt with: wavefront measurement and interpretation; wavefront sensing by phase retrieval; development and applications of wavefront sensing technology. 21 papers were presented, all of which are published

in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111302 SPIE Proceedings on Microscopy Techniques and Capabilities. Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368 (1983). [received: Sept. 1983] Conference held at: London, England. Date 21-22 Sept. 1982. Sponsors: IOP; IEE. The principal aim of the meeting was to describe the method of operation of a selection of the most recently developed techniques used in microscopy and to illustrate their practical capabilities by discussing a variety of applications. A total of 4 sessions, extending over 2 days, covered X-ray microscopy, electron microscopy, acoustic microscopy and infrared and visible microscopy. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111303 American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma. Geophys. Res. Lett. (USA), vol.10, no.8 (1983). Conference held at: Kona Coast, HI, USA. Date 7-11 Feb. 1983. The following topics were dealt with: whistlers in the VLF range, electron loss, effect of man-made transmissions, the interaction of heavy ions and waves with frequencies around the ion gyrofrequency, auroral zone processes, long-period pulsations, and plasma modification.

111304 Proceedings of the Sixteenth Rare Earth Research Conference. J. Less-Common Met. (Switzerland), vol.93, no.1 (1983). Conference held at: Tallahassee, FL, USA. Date 18-21 April 1983. The following topics were dealt with: lanthanide and actinide chemistry and physics; surface spectroscopy; organometallic chemistry; magnetic superconductors and spin glasses; bioinorganic chemistry; crystal fields and spectroscopy; industrial applications of rare earths; lanthanide-transition metal intermetallics and hydrides; inorganic structures and low valent compounds; structure-property relationships. 28 papers are published in full in the present proceedings, and 14 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111305 Nordic Conference on Surface Science. Phys. Scr. (Sweden), vol.T4 (1983). Conference held at: Tampere, Finland. Date 18-20 Aug. 1982. The following topics were dealt with: surface physics and biological phenomena; physisorption interaction; adsorbed atoms and adsorption layer superstructure formation; LEED measurement; surface phase transitions; photoelectron diffraction; surface electronic structure; photoelectron spectroscopy; surface catalysis; positron surface states; surface reactions; oxidation; electron spectroscopy; low temperature surface phase; spin-orbit coupling; crystal symmetry; Auger spectra; interface states; chemisorption and corrosion. 48 papers were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111306 Proceedings of the 4th Nordic Meeting on Nuclear Physics. Phys. Scr. (Sweden), vol.T5 (1983). Conference held at: Fuglso, Denmark. Date 16-20 Aug. 1982. Sponsors: NORDITA; Danish Natural Sci. Res. Council; Niels Bohr Inst. The following topics were dealt with: high spin phenomena; Gamow-Teller states; heavy-ion collisions; JET project; LEAR project; electromagnetic transitions; nuclear shape transitions; fragmentation reactions. 44 papers were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111307 Proceedings of the International Conference on Order in Chaos. Physica D (Netherlands), vol.7D, no.1-3 (May 1983). Conference held at: Los Alamos, NM, USA. Date 24-28 May 1982. The following topics were dealt with: order in chaos; chaotic systems; turbulence; nonlinear systems; superfluid ^4He ; bifurcations; dimensions; fractal structures; coherence; solitons; maps; fluids; vortices; Lie algebras; quantum chaos. 29 papers were presented, of which 27 are published in full in the present proceedings, and 2 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111308 Transactions of the 4th International Meeting on Radiation Processing. Radiat. Phys. & Chem. (GB), vol.22, no.3-5 (1983). Conference held at: Dubrovnik, Yugoslavia. Date 4-8 Oct. 1982. The following topics were dealt with: optichromic dosimetry; radiation processing of wires and cables, urban solid wastes, polymers, hides, rubber-insulated wires, effluents from livestock farms, liposomes, medical products, peat carriers for legume seed inoculants, herbal tea, onions, tomatoes, unfermented grape juice, poultry meat, fresh fish, pork, rice, white wine, pressure-sensitive adhesives, coating materials, sawdust-clay composites, archaeological artifacts and hydrogels; dosimetry; radiation safety; low energy accelerators and electron accelerators; depth-dose curves; electrochromism; gammagraphy; Isu and bremsstrahlung generators; corrosion; radiation-induced polymerisation; radiation sterilisation; regulation; radiation curing; radiation grafting; radiation polymerisation for preservation and radiation processing centres. 87 papers were published in the present proceedings.

111309 Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism. Osaka, Japan: Osaka University (1983), x+929 pp. Conference held at: Osaka, Japan. Date 16-20 May 1983. The following topics were dealt with: nuclear optical potential, phenomenological and microscopical; effective interactions and microscopic descriptions of nuclear reactions; inelastic and charge exchange scatterings; single step and multistep processes, breakup and transfer reactions; equilibrium and preequilibrium processes. 101 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111310 Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium. Amsterdam, Netherlands: Elsevier (1983), xvi+520 pp. [0 444 42174 2]. Conference held at: Paris, France. Date 1-7 July 1983. Sponsors: CNRS; Direction de la Recherche du Ministère Educ. Nat. The following topics covering the symmetries and properties of nonrigid molecules were dealt with: nonrigid molecule theory; classical molecular structure; symmetry operations; category theory; semi-direct product structure; induced representations; hyperfine structure; isometric groups; group theory; energy level classification; molecular vibrations and spectra; Jahn-Teller effect; permutational analysis; potential energy surfaces; rovibrational and rovibronic spectra. Applications to chemical reactions, liquid, crystal and nuclear physics are also discussed. 33 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111311 Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium. New York, USA: Plenum (1983), ix+302 pp. [0 306 41138 5]. Conference held at: New York, USA. Date 23-28 Aug. 1981. Sponsors: American Chem. Soc. The following topics were dealt with: fracture toughness of polymer blends; plastic-rubber composites; morphology; mechanical properties; melt rheology; dimensional stability; microphase segregation; block and graft polymers; interpenetrating polymer networks. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111312 Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium. New York, USA: Plenum (1983), xii+684 pp. [0 306 41134 2]. Conference held at: Capri, Italy. Date 15-19 June 1981. The following topics were dealt with: the role of the matrix in fibrous composite structures; composites in commercial aircraft and current research needs in aircraft structure; materials; chemical and environmental effects; short fibre reinforcement effects; interface effects; and continuous fibre reinforcements and design. 37 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111313 Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN). Luxembourg: Comm. European Communities (1982), 390 pp. Conference held at: Brussels, Belgium. Date 28-29 April & 12-13 May 1982. The following topics were dealt with: heat pump systems, industrial heat pumps, ground as heat source and advanced heat pumps.

111314 Proceedings of the Eighteenth General Assembly of the IAU. Dordrecht, Netherlands: Reidel (1983), x+603 pp. [90 277 1563 7]. Conference held at: Patras, Greece. Date 17-26 Aug. 1982. Sponsors: IAU. Presents a report of the inaugural ceremony and the General Assembly (sessions 1 and 2). Reports of the meetings of 40 commissions of the IAU are discussed.

111315 Defects in Semiconductors II, Symposium Proceedings. New York, USA: North-Holland (1983), xv+582 pp. [0 444 00812 8]. Conference held at: Boston, MA, USA. Date Nov. 1982. The following topics were dealt with: defects in Si, general and O-related; defects in III-V semiconductors; dislocations and interfaces; defects in relation to device properties; laser beam annealing and other special processes and materials. 61 papers are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111316 Proceedings of the 4th European Conference on Chemical Vapour Deposition. Eindhoven, Netherlands: Philips Centre Manuf. Technol. (1983), 586 pp. Conference held at: Eindhoven, Netherlands. Date 31 May-2 June 1983. The following topics were dealt with: analysis and theory; metals and superconductors; electronic materials; carbides and nitrides; oxides. 76 papers were presented, of which 59 are published in full in the present proceedings, and 5 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

111317 Extended Abstracts from the 164th Electrochemical Society Technical Meeting. Pennington, NJ, USA: Electrochem. Soc. (1983), xxvi+786 pp. Conference held at: Washington, DC, USA. Date 9-14 Oct. 1983. The following topics were dealt with: batteries; corrosion; dielectrics and insulation; thin film interfaces; electrodeposition processes; contacts, connectors and interconnections; semiconductor industry; semiconductor technology; high-temperature materials; industrial electrolytics; luminescence and display materials; experimental electrochemistry.

01.30E Monographs, and collections

111318 Elastic media with microstructure II. Three-dimensional models. I.A.Kunin. Berlin, Germany: Springer-Verlag (1983), viii+272 pp. [0 387 12078 5]. Crystals and polycrystals, composites and polymers, grids and multibeam systems can be considered as examples of media with microstructure. A characteristic feature of all such models is the existence of scale parameters which are connected with microgeometry or long-range interacting forces. As a result the corresponding theory must essentially be a nonlocal one. This treatment provides a systematic investigation of the effects of microstructure, inner degrees of freedom and nonlocality in elastic media. The propagation of linear and nonlinear waves in dispersive media, static, deterministic and stochastic problems, and the theory of local defects and dislocations are considered in detail. Especial attention is paid to approximate models and limiting transitions to classical elasticity. The book forms the second part of a revised and updated edition of the author's monograph published under the same title in Russian in 1975. The first part (vol.26 of Springer Series in Solid-State Sciences) presents a self-contained theory of one-dimensional models. The theory of three-dimensional models is considered in this volume. (368 refs.)

111319 Perturbative quantum chromodynamics. M.Jacob [Ed.]. Amsterdam, Netherlands: North-Holland (1982), viii+836 pp. [0 444 86420 2]. Over the past decade quantum chromodynamics (QCD) has developed into a very serious contender for a theory of strong interactions. As a theory of quarks and gluons interacting through their colour degree of freedom, it has the remarkable property of implying an effective coupling constant which decreases with momentum transfers or when interactions are probed at very short distances. While many problems remain to be solved, this remarkable property has allowed one to develop perturbative calculation techniques which have met with some definite success studying a wide array of phenomena

where large momentum transfers are involved. This perturbative approach has presently reached a level which is such that it is deemed appropriate to review it altogether, combining into a single volume several Physics Reports articles which provided timely reviews of QCD as it developed. Such a book could be used by the particle physicist not yet acquainted with QCD. It provides a self-teaching text. It should also be useful to the specialist by providing thorough discussions of questions which are still at the forefront of research and easy references to a large amount of material. Subjects discussed include: deep inelastic lepton-hadron scattering, hadron production in electron-positron annihilations, large mass lepton pair formation in hadron interactions and hadron or photon production at large transverse momentum. (1466 refs.)

Self-study manual on optical radiation measurements: Part I - Concepts, chapter 10. Introduction to coherence in radiometrySee Entry 111382

Self-study manual on optical radiation measurements: Part III - Applications, chapter 1. Measurement of solar terrestrial spectral irradiance in the ozone cut-off regionSee Entry 111383

01.30K Handbooks, dictionaries, tables and data compilation

111320 Shape functions for atomic-field bremsstrahlung from electrons of kinetic energy 1-500 keV on selected neutral atoms $1 \leq Z \leq 92$. L.Kissel (Sandia Nat. Labs., Albuquerque, NM, USA), C.A.Quarles, R.H.Pratt. *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.381-460 (May 1983). A tabulation is presented of theoretical predictions for the shape functions for atomic-field bremsstrahlung for 24 atoms with atomic number Z ranging from 1 to 92 for six incident electron energies T_1 from 1 to 500 keV. The shape function is defined as the ratio of the bremsstrahlung cross section differential in photon energy and angle to the photon energy spectrum. Shape functions have been tabulated for photon angles from 0° to 180° in 5° intervals of 12 values of the fraction of energy radiated k/T_1 from 0 to 1.0. The tables for $2 \leq Z \leq 92$ result from interpolations in atomic number and fraction of energy radiated from a set of benchmark data calculated by treating the bremsstrahlung process as a single-electron transition in a relativistic self-consistent screened potential. The table for $Z=1$ is calculated using a screened Born approximation. (7 refs.)

111321 Differential bremsstrahlung cross sections for collisions of electrons with unscreened nuclei of low atomic numbers. K.Bernhardt (Inst. für Experimentalphys. AG, Ruhr Univ. Bochum, Bochum, Germany), E.Haug, K.Wiesemann. *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.461-75 (May 1983).

Differential bremsstrahlung cross sections for unscreened nuclei are calculated using Sommerfeld-Maue eigenfunctions for the electronic continuum states. The photon energy spectrum and the shape function, defined as the ratio of the differential bremsstrahlung cross section to the photon energy spectrum, are tabulated for incident electron kinetic energies $T_1=5, 10, 50$, and 100 keV and for atomic numbers $Z=8, 18, 26$, and 36. For sufficiently low Z and for incident electron kinetic energies and emitted photon energies greater than the K -shell binding energy of the target atom, the present results for unscreened nuclei are in reasonable agreement with and easier to compute than the atomic-field bremsstrahlung cross sections. (10 refs.)

111322 Hartree-Fock momentum expectation values for atoms and ions. S.R.Gadre, P.S.Geji, S.J.Chakravorty (Dept. of Chem., Univ. of Poona, Pune, India). *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.477-91 (May 1983). Nonrelativistic (p^n) values are calculated for $n=-2, -1, 1, 2, 3$, and 4 from the analytic Roothaan-Hartree-Fock atomic wave functions of Clementi and Roetti. Results are tabulated for the ground and certain excited states of the atoms helium through xenon and their singly charged positive and negative ions. (12 refs.)

111323 Backscattering coefficients of H, D, and He ions from solids. T.Tabata (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan), R.Ito, Y.Iitaka, N.Itoh, K.Morita. *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.493-530 (May 1983). Experimental data on the number-backscattering coefficient R_N , the energy-backscattering coefficient R_E , and the mean fractional energy r_E of backscattered particles are tabulated for H, D, and He ions normally incident on elemental solids. References through 1981 are covered. The dependence of R_N and R_E on incident energy is shown graphically for energies from about 10 eV to 100 keV by plotting the experimental data and the empirical formulas of Tabata et al. (1981). Graphs are provided for 36 elemental targets of atomic numbers from 6 to 92. (27 refs.)

111324 Single-particle Glauber matrix elements. E.Oset (Dept de Fisica Atomica y Nuclear, Univ. de Valladolid, Valladolid, Spain), D.Strottman. *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.531-55 (May 1983). The single-particle matrix elements of the Glauber profile function are tabulated for harmonic oscillator single-particle wave functions. The tables are presented in such a manner as to be applicable if the hadron-nucleon elementary scattering amplitude is specified by either a partial wave expansion or a Gaussian in momentum transfer squared. The table is complete through the $1g_{9/2}$ orbital and contains entries for the $3s_{1/2}$ orbital for use if realistic wave functions are expanded in terms of harmonic oscillator functions. (9 refs.)

111325 Calculated oscillator strengths and wavelengths for allowed transitions within the third shell for ions in the Al-like isoelectronic sequence between Cl V and Ni XVI. B.C.Fawcett (Rutherford Appleton Lab., Chilton, Didcot, England). *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.557-78 (May 1983). Theoretical wavelengths and weighted oscillator strengths are tabulated for spectral emission lines of the ions Cl V, Ar VI, Ca VIII, Ti X, Cr XII, Fe XIV and Ni XVI, together with available measured wavelengths. The computations are made in a theoretical framework which includes all configuration-interactions within the complex of principal quantum number $n=3$ and involves the scaling of ab initio values of Slater radial energy integrals based on empirical data. The empirical scale factors and the adopted Slater parameters are listed along with derived energy levels and wave functions. Racah reduced radial dipole matrix elements are also given. (30 refs.)

111326 Calculated oscillator strengths and wavelengths for allowed transitions within the third shell for ions in the Mg-like isoelectronic sequence between S V and Ni XVII. B.C.Fawcett (Rutherford Appleton Lab., Chilton, Didcot, England). *At. Data & Nucl. Data Tables (USA)*, vol.28, no.3, p.579-96 (May 1983). Weighted oscillator strengths, energy levels, and wavelengths are calculated for the $3s^2-3s3p$, $3s3p-3p^2$, $3s3p-3s3d$, $3p^2-3p3d$, and $3s3d-3p3d$ transition arrays for Mg-like ions in the sequence from S V to Ni XVII. Their values are tabulated along with Slater radial integrals, Racah reduced radial dipole matrix elements, and level compositions. The theoretical procedure involves the computation of ab initio values for the Slater radial energy integrals and

their subsequent optimization in accordance with dependent measured wavelengths. Published energy levels are improved on the basis of new calculations of wavelengths of the $3s^2\ ^1S_0-3s3p\ ^3P_1$ intercombination lines. Observational wavelength and energy-level data are tabulated. (31 refs.)

111327 Nuclear data sheets for A=79. B.Singh, D.A.Viggars (Kuwait Inst. for Sci. Res., Kuwait). *Nucl. Data Sheets (USA)*, vol.37, no.3, p.393-485 (Nov. 1982). [received: Sept. 1983]

The 1975 version of Nuclear Data Sheets (75Ur03) has been revised. Nuclear spectroscopic information for known nuclides of mass number 79 (Zn, Ga, Ge, As, Se, Br, Kr, Rb, Sr) has been evaluated and presented together with adopted level energies level J^π s and γ -rays in these nuclei. No data are yet available for excited states in ^{79}Zn and ^{79}Ga . (153 refs.)

111328 Nuclear data sheets for A=153. M.A.Lee (Idaho Nat. Engng. Lab., EG&G Idaho Inc., Idaho Falls, ID, USA). *Nucl. Data Sheets (USA)*, vol.37, no.3, p.487-594 (Nov. 1982). [received: Sept. 1983]

The experimental results from the various reaction and decay studies leading to nuclides in the A=153 mass chain have been reviewed. These data are summarized and presented, together with the adopted level schemes and properties. (203 refs.)

111329 Recent References, January through April 1983 [nuclear data sheets]. S.Ramavataram (Brookhaven Nat. Lab., Upton, NY, USA). *Nucl. Data Sheets (USA)*, vol.37, no.4, p.595-717 (Dec. 1982). [received: Sept. 1983]

Gives nuclear data references for levels, J^π and transitions for various nuclei received in the period January to April 1983. (506 refs.)

111330 Optical fiber systems: Technology, design, and applications. C.K.Kao.

New York, USA: McGraw-Hill (1982), xi+204 pp. [0 07 033277 0]

The book is written to give the readers a glimpse of the range of application and the impact of this technology, as well as to introduce the associated technology of optical fiber systems in a concise and, hopefully, clear manner. The reader can see the interrelationship of the technology and its implications, construct the basis of a system design and perceive the relative advantages and disadvantages.

111331 Selected tables of atomic spectra. Atomic energy levels and multiplet table. O IV. Data derived from the analyses of optical spectra. C.E.Moore.

Report NSRDS-NBS-3-Sect.10, Nat. Bur. Stand., Washington, DC, USA (March 1983), viii+14 pp.

The present publication is the tenth section of a series being prepared in response to the need for a current revision of two sets of the author's tables containing data on atomic spectra as derived from analyses of optical spectra. Part A contains the atomic energy levels and Part B the multiplet tables. Data for O IV are included.

Effect of excited states on thermonuclear reaction ratesSee Entry 116631

01.30M Textbooks for graduates and researchers

111332 Radiation effects computer experiments. J.R.Beeler, Jr.. Amsterdam, Netherlands: North-Holland (1982), xviii+873 pp. [0 444 86315 X]

This book is intended as an introductory handbook, and as a guide for people wishing to learn how to develop and use computer experiment programs to simulate defect production and annealing in solids. Each particular computer experiment approach described has been proven in practice by several competing computer experimenters. Both the functional structure and procedure for the use of these approaches is easily understood. Historically, radiation effects theory has tended to concentrate on either the primary production of Frenkel pairs by a collision cascade or the diffusion of 'free' defects to various sinks long after the primary defect production events have occurred. The intermediate regime is seldom treated. During the intermediate regime, (1) some defects collect into clusters, (2) a large fraction of the defects produced is annihilated, and (3) a small minority emerges as mobile (free) defects, sufficiently far from their origins to have forgotten their native regions. This regime, called short-term annealing ion implantation, is covered in detail in this book and is held as being equal in importance to the primary defect production process. (257 refs.)

111333 Laser annealing of semiconductors. J.M.Poate, J.W.Mayer [Ed.]. London, England: Academic Press (1982), xi+564 pp. [0 12 558820 8]

The laser annealing of semiconductors deals with the materials science of surfaces that have been subjected to ultrafast heating by intense laser beams. The time scale is such that layers can melt and recrystallize in a few hundred nanoseconds. This rapid resolidification of semiconductors has led to novel regimes of phase formation and has served as a means of removing implantation damage. It was this latter aspect that stimulated the field. The chapters in this book follow a logical sequence from basic concepts to device structures. The topics covered include: crystallisation processes; fundamentals of energy deposition; heat flow calculations; supersaturated alloys, solute trapping and zone refining; microstructure and topography; epitaxial growth; surface properties; solid phase regrowth; compound semiconductors; silicides and metastable phases; applications.

01.30P Textbooks for undergraduates

111334 Advances in Mossbauer spectroscopy. Applications to physics, chemistry and biology. B.V.Thosar, P.K.Iyengar, J.K.Srivastava, S.C.Bhargava [Ed.].

Amsterdam, Netherlands: Elsevier (1983), xxiv+924 pp. [0 444 42186 6]

The resonance spectroscopy of gamma-radiation, conventionally known as Mossbauer spectroscopy, after its discovery a quarter of a century ago has developed into an important and versatile tool for the study of solid state properties. The book reviews the experimental method and describes its applications to problems in the general domain of solid state physics. The book is intended to serve as an introductory text to students and to researchers who are new in the field, as well as to provide the specialist with information outside of his immediate field of interest.

111335 Surface physics. Second edition. M.Prutton.

Oxford, England: Clarendon (1983), 138 pp. [0 19 851855 2]

This book emphasizes the physical aspects of surface physics and should have a wide interdisciplinary appeal. It reviews the physical techniques that are now available to give reliable diagnostics of crystal surfaces. Case studies of the application of these techniques to important technological surfaces convey clearly the present state of the art. There are chapters on surface chemical composition, surface structure, surface electronic properties, atomic motion on surfaces, and adsorption of atoms and molecules on surfaces. The book is

suitable as a text for a final-year undergraduate course in physics, chemistry, materials science or electrical engineering. A general background of solid-state physics or chemistry is a necessary prerequisite, but no sophisticated mathematics is needed. (107 refs.)

111336 Recent bibliography on analytical and sampling problems of a PWR primary coolant. Supplement II. H. Illy. Report KFKI-1983-81, Hungarian Acad. Sci., Budapest (1983), 22 pp. The first two bibliographies on Analytical and Sampling Problems of a PWR Primary Coolant (KFKI Report-1980-48 and KFKI Report-1981-97) were published in 1980 and 1981, and covered the literature published in the previous 8-10 years. The present Supplement II reviews the subsequent literature up till June 1983. It also includes some references overlooked in the first two volumes. The serial numbers are continued from the first two bibliographies. Cross-referencing was not intended. (178 refs.)

01.40 EDUCATION

111337 Procedure for written test follow-ups in large sections of university physics. R.R.Boedeker (Dept. of Phys., Southern Illinois Univ., Edwardsville, IL, USA). <i>Am. J. Phys. (USA)</i> , vol.51, no.9, p.859-60 (Sept. 1983). In an earlier article (1978) the author discussed the use of oral follow-ups to written tests. These orals offer students some incentive to improve their understanding of concepts which caused trouble on the written exam. By concentrating on the weak area immediately, they can fill in gaps in knowledge which may be essential to subsequent material. That article outlined an alteration of an earlier approach found in the literature (1975) and the purpose of this note is to present a written follow-up alternative to the oral method. The author believes that the oral method is better and still uses it in small sections (mostly upper level and graduate physics courses), but because of time pressures caused by heavy work loads and large enrollments in sections of University Physics, he has used the written follow-up method recently in these large sections. (4 refs.)	
111338 Biomedical engineering course development for health care delivery. A.Ambardar (Dept. of Electrical Engng., Michigan Technol. Univ., Houghton, MI, USA). <i>IEEE Trans. Educ. (USA)</i> , vol.E-26, no.3, p.111-15 (Aug. 1983). A new program of courses in biomedical engineering has been initiated at Michigan Technological University, both at the graduate and undergraduate level. The rationale for the development of these courses stems from the rapid growth in technology which has permeated almost all areas of health care delivery. The major goals of each course are described in terms of (1) establishing a required level of technical competence and literacy in the field, (2) developing those communication skills that will typically be required of the students after graduation, and (3) developing a sense of challenge which will last the students beyond their formative years. The philosophy underlying the choice of topical content, course organization, and student evaluation are all considered within the broader framework of establishing a modern foundation which the student, as well as the industrial and clinical community, can readily appreciate and identify with. (21 refs.)	
111339 The crisis in high-school physics education: overview of the problem. J.W.Layman. <i>Phys. Today (USA)</i> , vol.36, no.9, p.26-30 (Sept. 1983). The present situation is the culmination of a long trend—interrupted only weakly in the Sputnik era—of declining enrollments in physics, but the state of the economy may provide a new context. (16 refs.)	
111340 The crisis in high-school physics education: why physicists leave teaching. B.F.Porter (American Inst. of Phys., New York, NY, USA), W.H.Kelly. <i>Phys. Today (USA)</i> , vol.36, no.9, p.32-7 (Sept. 1983). A host of problems leads one to wonder who will be there to teach the coming generation of students to work and to succeed in the technological society. (5 refs.)	
111341 The crisis in high-school physics education: paths to a solution. J.R.Franz, B.G.Aldridge, R.B.Clark. <i>Phys. Today (USA)</i> , vol.36, no.9, p.44-9 (Sept. 1983). How local, state and national initiatives are addressing the need for improved financial benefits, better training and greater recognition for science teachers, and for programs to attract more science students. (5 refs.)	

111342 The crisis in high-school physics education: places where things are right. J.M.Wilson (American Assoc. of Phys. Teachers, New York, NY, USA), T.C. Ingoldsbey.

Phys. Today (USA), vol.36, no.9, p.52-7, 60 (Sept. 1983). Analysis of the reasons for the success of a number of outstanding high-school programs in physics suggests a set of conditions for creating successful programs at other schools. (1 ref.)

111343 Experimental physics courses at the Universidad Autonoma Metropolitana, Unidad Iztapalapa. M.A. Patron (Dept. de Fisica, Univ. Autonoma Metropolitana, Mexico City, Mexico).

Rev. Mex. Fis. (Mexico), vol.29, no.3, p.409-17 (May 1983). In Spanish. [received: Sept. 1983]

The criteria and objectives that were used to design the curriculum of experimental physics of the UAM Iztapalapa are briefly discussed. The contents of each course is presented as well as its relationship with the original aims. (no refs.)

01.50 EDUCATIONAL AIDS

111344 The physics of karate. S.R. Wilk, R.E. McNair, M.S. Feld (Dept. of Phys., MIT, Cambridge, MA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.783-90 (Sept. 1983).

This study analyzes physical aspects of a karate strike and its interaction with a target, examining some heretofore unexplored dynamical and biomechanical questions. (22 refs.)

111345 Periodic boundary conditions in special relativity. P.C. Peters (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.791-5 (Sept. 1983).

The imposition of periodic boundary conditions on the space-time of special relativity is shown to lead to the existence of a preferred frame of reference. One characteristic of the preferred frame is that it is the frame in which the resulting finite universe has the smallest size. In a frame moving with respect to the preferred frame, global synchronization of clocks cannot be carried out and the transit time to traverse the universe depends on the direction of travel. As measured in a moving frame, a person at rest in the preferred frame can be found at two or more different places at the same time, although the age of the person will be different at each of those places. A 'pole in the universe' paradox is presented, the resolution of which requires use of some of these bizarre properties of the universe of periodic boundary conditions. (3 refs.)

111346 Clock synchronization, a universal light speed, and the terrestrial red-shift experiment. A.L. Macdonald (Luther Coll., Decorah, IA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.795-7 (Sept. 1983).

This paper (i) gives necessary and sufficient conditions that clocks in an inertial lattice can be synchronized, (ii) shows that these conditions do not imply a universal light speed, and (iii) shows that the terrestrial red-shift experiment provides evidence that clocks in a small inertial lattice in a gravitational field can be synchronized. (8 refs.)

111347 Under \$100 home computers as laboratory devices. F.J. Wunderlich, D.E. Shaw (Dept. of Phys., Villanova Univ., Villanova, PA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.797-801 (Sept. 1983).

The purpose of this article is to alert physics educators to an important new application of inexpensive home computers in the undergraduate laboratory. These computers can be used to establish cost effective yet versatile experimental laboratory stations which directly measure physical parameters and control experiments, as do their more expensive computer counterparts. As specific examples, the authors illustrate how the computer with minimal circuitry can function as digital voltmeter and pulse counter. (26 refs.)

111348 Home-experimental demonstrations of Hart's frictional force rotor. F.S. Crawford (Dept. of Phys., Univ. of California, Berkeley, CA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.804-6 (Sept. 1983).

A block, pushed steadily across the slope of a plane inclined to the horizontal at less than the critical angle, describes a straight-line trajectory having a direction independent of velocity. If instead the block is projected across the slope and then allowed to slide freely, it stops after describing a curved trajectory. For different initial velocities the stopping points all lie on the same straight line. For small inclinations of the plane this stopping-point line makes an angle with the direction of constant elevation that is just half the angle that the trajectory of the steadily pushed block makes with that direction. (1 ref.)

111349 Nonionizing radiation: appropriate topic in a physics curriculum. A.J. Adams (Graduate Inst. of Technol., Univ. of Arkansas, Little Rock, AR, USA).

Am. J. Phys. (USA), vol.51, no.9, p.807-10 (Sept. 1983).

A three-hour, one-semester course in nonionizing radiation for students in the interdisciplinary field of electronics and instrumentation is outlined. Electromagnetic radiation extending from the ultraviolet to the 60-Hz power frequency and ultrasonic radiation were discussed. Emphasis was placed on the nature and sources of the radiation, the biophysical interaction mechanisms, and the instrumentation used to measure nonionizing radiation. (17 refs.)

111350 Electron impact excitation and UV emission in the Franck-Hertz experiment. W. Buhr, W. Klein (I. Phys. Inst., Univ. Koln, Koln, Germany), S. Pressler.

Am. J. Phys. (USA), vol.51, no.9, p.810-14 (Sept. 1983).

With the Franck-Hertz experiment described the inelastic collision of electrons with mercury atoms and the ultraviolet emission of the excited atoms can be observed simultaneously. The Franck-Hertz tube is a four electrode tube with a concentric system and a quartz window. An electron current stabilization allows the observation of a stepwise increase in light intensity by means of a photomultiplier. The emission spectrum shows the Hg 2536-Å line and two molecular emission bands arising from Hg dimer and trimer transitions. The light emission from the trimer state reveals the influence of geometrical factors of the tube at different accelerating potentials. (17 refs.)

111351 An optimal speed for traversing a constant rain. S.A. Stern (Dept. of Civil Engng., Univ. of Texas, Austin, TX, USA).

Am. J. Phys. (USA), vol.51, no.9, p.815-18 (Sept. 1983).

Whether it is better to walk or run through a rain shower is a question often posed by adult and child alike. The answer to this question requires careful physical analysis and provides an instructive even illuminating exercise for high school as well as undergraduate introductory physics classes. The author derives a rule for the optimal travel speed which minimizes the number of rainstrikes on a given surface element over a given course. He also investigates the speed versus intensity relationship. Methods of extending these results to include rainfalls with horizontal velocity relative to the travel path and for surfaces of arbitrary geometry are presented. (4 refs.)

111352 A criterion for stationary states in quantum mechanics. M.R. Aub

(Dept. of Math., Univ. of the West Indies, Kingston, Jamaica), H. Niederreiter.

Am. J. Phys. (USA), vol.51, no.9, p.818-19 (Sept. 1983).

The authors show a criterion for a vector ϕ in a complex inner product space V to be an eigenvector of a Hermitian operator A in V in terms of the values of inner products $\langle X\phi, A\phi \rangle$ for Hermitian operators X . This result can be applied to the characterization of stationary states in quantum mechanics. (7 refs.)

111353 A spherical viewing screen for diffraction patterns. R.D. Ayers (Dept. of Phys.-Astron., California State Univ., Long Beach, CA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.820-3 (Sept. 1983).

Fraunhofer diffraction from a planar diffracting object is explained in terms of spatial Fourier transforms and the Ewald sphere construction from solid-state physics. It is found that the most meaningful view of such a diffraction pattern is obtained by letting it fall on a spherical screen centered upon the diffracting object and then observing the pattern from a distance along the normal to the plane. This visual projection yields a circular portion of the two-dimensional spatial transform of the diffracting object without any geometrical distortion. A classroom demonstration using a laser and crossed gratings of good quality illustrates clearly the superiority of this viewing technique over the standard procedure of simply allowing the pattern to fall directly on a flat screen. (9 refs.)

111354 Measurements on the He-Ne laser lines near 633 nm. D.W. Steinhilber (Dept. of Phys., Southwestern at Memphis Coll., Memphis, TN, USA).

Am. J. Phys. (USA), vol.51, no.9, p.824-5 (Sept. 1983).

The red line from an inexpensive He-Ne laser is made up of several closely spaced lines. To separate these lines very high spectral resolution is required. This apparatus requirement can be met by a simple modification of a student Fabry-Perot interferometer. Laboratory measurements can then be made to verify the expected number, spacing, and polarization of these lines during a single afternoon laboratory session. (12 refs.)

111355 Some novel delta-function identities. C.P. Frahm (Illinois State Univ., Normal, IL, USA).

Am. J. Phys. (USA), vol.51, no.9, p.826-9 (Sept. 1983).

Two novel identities arising from the second- and third-order derivatives of the reciprocal radial distance and involving delta functions are introduced, proven, and illustrated. A general procedure is described for establishing similar identities for higher-order derivatives of the reciprocal radial distance. (9 refs.)

111356 How batteries work: a gravitational analog. D. Roberts (Dept. of Phys., MIT, Cambridge, MA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.829-31 (Sept. 1983).

There is a region in any battery where the charges move in a direction opposite to that of the electric force on them. A 'gravitational cell' is used to show that this motion is a diffusion analogous to that against pressure gradients in osmotic pressure situations. The driving mechanism for the diffusion is the existence of lower lying states in one region compared to an adjacent region, and it is relaxation into these low lying states that is the source of energy for the circuit. (8 refs.)

111357 Optical correlator using the incoherent light of a slide projector. A. Hairie, J. Provost (Inst. des Sci. de la Matiere, Univ. de Caen, Caen, France).

Am. J. Phys. (USA), vol.51, no.9, p.832-6 (Sept. 1983).

The simple apparatus based on geometrical optics described allows both qualitative and quantitative verification of the main properties of convolution, correlation, or autocorrelation. These concepts are of considerable interest in several areas of physics and engineering. Qualitative verifications are easily made by projection of convolution or correlation function on a screen. Quantitative verifications have been performed in the case of functions of one coordinate by recording convolution or correlation on an X-Y recorder. (8 refs.)

111358 The Born centenary: remarks about classical thermodynamics. P.T. Landsberg (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA).

Am. J. Phys. (USA), vol.51, no.9, p.842-5 (Sept. 1983).

Max Born (1882-1970) advocated Caratheodory's approach to thermodynamics in 1921 and 1949, and it was expounded by various authors in the intervening years, but it did not come into general use. Some historical remarks are made concerning the discussions between Born and Caratheodory. Although the Caratheodory approach continues to be regarded as 'difficult', it is noted that his principle (as contrasted with what is called his theorem) is really straightforward in concept. It is emphasized that there was a need to push Caratheodory's approach further since it did not cover the third law of thermodynamics, and that set theory and simple topological concepts provided the ideal tools to achieve this aim. This led to a more complete geometrization of thermodynamics. Although specialized and mathematical work on the axiomatization of thermodynamics continued in the 1960s and 1970s, there also emerged a reasonably simple way of combining elements of the geometrical approach and the approach via thermodynamic cycles, as it is recalled. When Born died in 1970 this work was essentially complete. (27 refs.)

111359 General solution of the classical Schwinger model. F.J. Carbajo, E. Sanchez-Velasco.

Am. J. Phys. (USA), vol.51, no.9, p.845-7 (Sept. 1983).

The general solution of the massless Maxwell-Dirac equations in 1+1 dimensions, the classical version of the Schwinger model, is found. This solution serves as a good introduction in an intermediate course of mathematical physics to the study of concentrated propagating waves. (3 refs.)

111360 Rubens flame tube demonstration: a closer look at the flames. G.F. Spagna, Jr. (Rensselaer Polytech. Inst., Troy, NY, USA).

Am. J. Phys. (USA), vol.51, no.9, p.848-50 (Sept. 1983).

The author studies how structure and behavior of flames is affected by the sound driving the tube by examining the individual flames using a variety of techniques and instruments. Specifically, they deal with photocell, microphone, television, film and schlieren projection observations. The television and schlieren studies were done with a stroboscopic disk, the photocell and microphone studies employed a dual trace oscilloscope, and the film study was done with a high-speed rotating prism camera. (8 refs.)

111361 Teaching first-year kinematics via the scalar product. T.H. Chyba (Dept. of Phys., Randolph-Macon Coll., Ashland, VA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.851 (Sept. 1983).

A systematic development of vector mathematics in a calculus-based physics course constrains the teacher to introduce the cross and dot products during the first two weeks. Unfortunately, their application to physics is forsaken until later discussions of work (6th week) and torque (11th week). Several texts offer geometrical interpretations of these products, which, though instructive, are not germane to the development of mechanics. The problem is how to reinforce these concepts quickly within the natural presentation of

mechanics. The author describes one application of the scalar product to kinematics (3rd week) which is not mentioned in common texts. (2 refs.)

111362 The range of a data set: a quick estimator of the standard deviation. G.C.Kyker, Jr. (Kose-Hulman Inst. of Technol., Terre Haute, IN, USA).

Am. J. Phys. (USA), vol.51, no.9, p.852 (Sept. 1983).

One of the concepts most stressed in the elementary physics laboratory is the need to assess the uncertainty in each measurement of a physical quantity, as the measurement is made. In practice, one of the most usual ways in which students are taught to do this is by making repeated trials of a measurement and calculating a standard deviation. There are good practical reasons for knowing the precision of a set of data while one is working in the laboratory—to signal the need for more or different measurements, to flag a malfunctioning piece of equipment, and so on. On the other hand, frequent pauses to calculate out a standard deviation during the work in a student lab are annoying, distracting, and error prone. It turns out that the range of a set of numbers provides an estimate of the standard deviation that is available literally at a glance, and is nearly as good an estimate as the usual calculation. (7 refs.)

111363 A simple demonstration of spherical aberration. A.R.Lachaine, P.Rochon (Dept. of Phys., Royal Military Coll., Kingston, Ontario, Canada).

Am. J. Phys. (USA), vol.51, no.9, p.853-5 (Sept. 1983).

The study of geometrical optics has long been an integral part of any course in elementary physics. Indeed, the introduction of the paraxial rays approximation and Snell's law make the study of thin lenses tractable in easy and concise mathematical form. In the laboratory, however, the student quickly becomes aware of the limitations of the theory and finds that the aberrations, often just mentioned in the lectures, are very important and are the origin of many errors in measurement. The failure of all rays from a point object on the optic axis to converge to a single point image is due, in part, to spherical aberration, i.e. to the spherical form of the lens surfaces. Although, in general, calculations of spherical aberrations in lenses can be quite complicated, requiring in many instances use of numerical methods, a particular case, described by the authors, involving a plano-concave diverging lens, permits comparison between experiment and a simple analytical theory. (6 refs.)

111364 More on two-dimensional scattering. P.A.Maurone (Dept. of Phys., Villanova, Univ., Villanova, PA, USA), T.K.Lim.

Am. J. Phys. (USA), vol.51, no.9, p.856-7 (Sept. 1983).

The authors have given a derivation of the optical theorem in two dimensions and shown its consistency with the standard partial wave analysis. One should notice that this presentation is more difficult in the two-dimensional case than it was in the three-dimensional case. The study of this two-dimensional problem as an introduction to the three-dimensional case is probably not a good pedagogical tool. However, the authors feel there is justification for studying two-dimensional dynamics since there are a wealth of physical applications. (5 refs.)

111365 Newton's law of cooling with finite reservoirs. P.A.Maurone, C.Shiomos (Dept. of Phys., Villanova Univ., Villanova, PA, USA).

Am. J. Phys. (USA), vol.51, no.9, p.857-9 (Sept. 1983).

A compact analysis of both theory and experiment that the authors find very appropriate for an introductory laboratory course is presented. Students surmise that when one has two finite samples in a cooling experiment, the samples should both exhibit some sort of exponential behavior toward final equilibrium. In this paper they are shown how to derive and verify this intuition. The apparatus described is inexpensive, easy to construct, and experimental results are easily reproducible. (12 refs.)

111366 Galactic lens. J.Higbie (Dept. of Phys., Univ. of Queensland, Brisbane, Queensland, Australia).

Am. J. Phys. (USA), vol.51, no.9, p.860-1 (Sept. 1983).

It is well known that light rays are 'bent' in the vicinity of a gravitating object such as the Sun or a black hole. Earlier, a plastic lens has been described which simulates this action and demonstrates quite convincingly the visual distortions which arise and in particular the generation of visual double images of a single source (1980, 1981). One of these lenses was constructed in response to the recently announced discovery of a double quasar which is thought to be a gravitational double image. In the Scientific American article discussing this phenomenon, Frederick Chaffee (1980) mentions the possibility of three images being produced if the gravitating object has an extended mass distribution. In order to see how this can come about and to appreciate how the various images differ from one another, the authors have constructed yet another plastic lens which simulates the action of an extended (transparent) mass distribution. (4 refs.)

111367 Spectroscopically silent fundamental vibrations. R.L.Keiter (Univ. of Illinois, Urbana, IL, USA).

J. Chem. Educ. (USA), vol.60, no.8, p.625 (Aug. 1983).

Nonlinear polyatomic molecules will have 3N-6 fundamental vibrations is readily understood, and that these vibrations may be infrared or Raman active is common knowledge. The student is led to see that a fundamental vibration will be infrared active only if it is accompanied by a change in dipole moment and Raman active only if there is a change in polarizability (symmetry selection rules). Furthermore, for a centrosymmetric molecule a given vibration cannot be both infrared and Raman active (rule of mutual exclusion). Unless these concepts are taught carefully certain extensions of thought are implied which are not true. While most chemists know that a fundamental vibration may be both infrared and Raman active and that it may be either infrared or Raman active, few appear to be aware that it may be neither. It also appears that many nonspectroscopists who deal with these topics in their teaching have not considered the spectroscopically silent vibration. It is the purpose of this communication to explore the reasons for this pedagogical blind spot. (3 refs.)

111368 Adiabatic lapse rates of planet atmospheres. H.F.Blanck (Austin Peay State Univ., Clarksville, TN, USA).

J. Chem. Educ. (USA), vol.60, no.8, p.637-8 (Aug. 1983).

It has recently been suggested by Blanck (1982) and Earl (1982) that derivations of the equation for the dry adiabatic lapse rate and related equations which give the temperature and pressure of planet atmospheres as a function of altitude be included in undergraduate physical chemistry class discussions and textbooks. Using the hydrostatic equation $dp = -\rho g dh$, the ideal gas law, and an adiabatic change of state equation for an ideal gas, a straightforward derivation yields $-dT/dh = Mg/C_p$, $T = T_0 - Mgh/C_p$, and $p = p_0 [1 - Mgh/C_p T_0]^{C_p/R}$ provided the heat capacity is treated as being constant. While these derivations are certainly worthwhile additions to physical chemistry material, it is equally important to discuss the consequences of these equations and relate them to actual planet atmospheres where possible. (12 refs.)

111369 Bond angles and hybridization indices in AX₂YZ and AX₂Y systems. G.Gilli, V.Bertolasi (Istituto Chimico, Univ. di Ferrara, Ferrara, Italy).

J. Chem. Educ. (USA), vol.60, no.8, p.638-9 (Aug. 1983).

The authors discuss the solution of the bond angles and hybridisation indices for the AX₂YZ or AX₂YE (where E denotes a lone pair) systems of C_s symmetry and, for the particular case of the AX₂Y system of C_{2v} symmetry. (11 refs.)

111370 Note on a simple derivation of Planck's formula from special relativity. J.B.Dence (Washington Univ., St. Louis, MO, USA).

J. Chem. Educ. (USA), vol.60, no.8, p.645-6 (Aug. 1983).

Textbooks of physical chemistry and of general physics still present the events of the period of the old quantum theory (1900-25) in a historical manner. For example, the Planck formula, $E = h\nu$, for the quantization of electromagnetic radiation is usually presented as a bold and ground-breaking proposal, which it was in 1905. The authors present a simple alternative way of introducing the important Planck formula. While the treatment here does not pretend to be an original idea, it is to be found in very few textbooks and, therefore, may not be too well known. The authors show how the equation may be deduced from ideas of special relativity and the hypothesis of wave-particle duality. (no refs.)

111371 Kinetic models for adiabatic reversible expansion of a monatomic ideal gas. On-Kok Chang (Univ. of California, Davis, CA, USA).

J. Chem. Educ. (USA), vol.60, no.8, p.647-8 (Aug. 1983).

The model contains a fixed amount of an ideal gas confined in an adiabatic cylinder and piston device. The piston is moved outward slowly with a constant speed u by an external device, with u much smaller than the average velocity of gas molecules. In this process, the gas expands reversibly and adiabatically. (2 refs.)

111372 Measurement of mass. R.W.Zimmerer (Univ. of Colorado, Boulder, CO, USA).

Phys. Teach. (USA), vol.21, no.6, p.354-9 (Sept. 1983).

Many examples of mass measurement depend on basic physics which has been known and understood since Newton first proposed it. Adapting these physical laws to construct instruments for the measurement of mass has depended on mechanical and electronic apparatus of ever increasing complexity and sophistication. Various techniques become practical or obsolete according to the ever changing state of the art. The author considers the impact modern technology has had in this small field of mass measurement and speculates on what future developments might be. (3 refs.)

111373 More bicycle physics. T.B.Greenslade, Jr. (Dept. of Phys., Kenyon Coll., Gambier, OH, USA).

Phys. Teach. (USA), vol.21, no.6, p.360-3 (Sept. 1983).

The author presents several examples drawn from experience in cycling, for use in teaching mechanics. These include: a West Indian Rastafarian broom seller carrying brooms on his head, turning a corner while riding a bicycle; the problems of riding a Penny-farthing (known as an Ordinary bicycle in the US); and a model for bicycle dynamics. (3 refs.)

111374 Bernoulli on a large scale. A.A.Bartlett (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).

Phys. Teach. (USA), vol.21, no.6, p.376-7 (Sept. 1983).

The author describes the rising air currents over the press box at a football stadium, traced by the movements of litter from a football game. The circulation of large pieces of paper indicates clockwise circulation of air from the field, up the inclined row of seats, up the side of the press box, into a low pressure region, round and down to the field again. This appears to be a large-scale manifestation of the Bernoulli principle. (1 ref.)

111375 Practical mechanics: raising a mast. R.L.Neman (Dept. of Chem., East Central Univ., Ada, OK, USA).

Phys. Teach. (USA), vol.21, no.6, p.379-80 (Sept. 1983).

The author discusses the mechanics of raising a long pole, ladder, post, antenna support tower, or basketball goal support by 'walking' the object from a horizontal position to a vertical one. The first few steps are not bad, but as the mast is raised further into the air, the job becomes increasingly more difficult; even the lightest structure can be deceiving. There comes a point, however, at which the job becomes easy once again, and finally, at vertical, the 'weight' of the mast is apparently zero; all one has to do is keep it balanced until it is secured. The analysis of the situation is an excellent example of practical physics for the students of mechanics. (1 ref.)

111376 Kinematics of a student. J.H.Nelson (Harrington High School, Rosemont, PA, USA).

Phys. Teach. (USA), vol.21, no.6, p.386-7 (Sept. 1983).

Describes experiments that involve the student as the object of the experiment. Other such experiments include measuring: student reaction time; horsepower generated by a student. Such experiments generate student interest and thus increase understanding of the physics principles involved. (2 refs.)

111377 Homemade rainbows: a backyard experiment. R.W.Robinett (Dept. of Phys., Univ. of Wisconsin-Madison, Madison, WI, USA).

Phys. Teach. (USA), vol.21, no.6, p.388-90 (Sept. 1983).

The natural phenomenon of the rainbow has fascinated man throughout history; it has appeared in literature since at least Biblical times and intrigued scientists since Aristotle. The history of man's attempts to understand the rainbow has been admirably reviewed by Boyer (1959) while many sources treat the optics of its formation in detail. Primary and secondary bows can be easily seen using the fine mist of a garden hose. Such a 'homemade' rainbow not only makes a good demonstration, but the quantitative predictions of its location and size can be verified with the absolute minimum of equipment, making it useful for a simple home project or outdoor experiment. The author briefly reviews the physics of the rainbow using only the ideas of reflection and refraction. (9 refs.)

111378 Standing waves—a new twist. C.J.Roddy (North Carolina State Univ., Raleigh, NC, USA).

Phys. Teach. (USA), vol.21, no.6, p.408-9 (Sept. 1983).

In order to demonstrate standing waves to a large lecture audience or even a moderate one, it has been traditional to use a small string vibrator and line or to shake a rubber rope. Both of these are adequate demonstrations; however, the vibrating string is hard for students to see, and the rubber rope is difficult for the lecturer to operate effectively. The author presents a new apparatus that alleviates these problems while keeping costs to a minimum. (no refs.)

111379 Resonance demonstrator. T.A.Scott (Missouri Western State Coll., Saint Joseph, MO, USA).

Phys. Teach. (USA), vol.21, no.6, p.409 (Sept. 1983).

The author describes a resonance demonstrator with ball-bearing and wire oscillators, mounted on a wooden frame and driven by a variable speed rotator. By changing the speed of the variable rotator, the different oscillations can be excited separately. (no refs.)

111380 Conversations with Avogadro. D.Moreno (Dept. de Fisica, Facultad de Ciencias, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico). *Rev. Mex. Fis. (Mexico)*, vol.29, no.3, p.401-8 (May 1983). In Spanish. [received: Sept. 1983]
A criticism is made of the most usual type of teaching laboratory practice. It is shown that experiments designed for measurements of fundamental constants are specially dangerous. As an example, an analysis is made of an 'experiment' to determine Avogadro's number and the argument is presented that probably the only one to learn some physics from this type of experiment, is the physicist who wrote it. A proposal is made to turn around this drawback and to produce some laboratory activities with more educational value. (2 refs.)

111381 Physics in Xalapa. C.R.de la Cruz (Facultad de Fisica, Univ. Veracruzana, Xalapa, Mexico). *Rev. Mex. Fis. (Mexico)*, vol.29, no.3, p.449-60 (May 1983). In Spanish. [received: Sept. 1983]
A brief history of the development of physics in the state of Veracruz is presented. This account is mainly based on the activities centered at the Universidad Veracruzana. (no refs.)

111382 Self-study manual on optical radiation measurements: Part I - Concepts, chapter 10. Introduction to coherence in radiometry. J.B.Shumaker. **Report NBS-TN-910-6**, Nat. Bur. Stand., Washington, DC, USA (March 1983), viii+60 pp.
The manual is a comprehensive tutorial treatment of the measurement of optical radiation that is complete enough for self instruction. Detailed chapter summaries make it also a convenient authoritative reference source. In this chapter the reader is introduced to the basic field quantity of the theory of partial coherence, the cross-spectral density function, and shown how it is used to describe radiation fields. The propagation of cross-spectral density along a beam is discussed and this propagation illustrated with calculations of diffraction effects in a number of simple aperturing and imaging examples. For instance, the author treats in considerable detail one of the most common radiometric situations in which coherence effects can manifest themselves, the measurement of the slit-scattering function of a monochromator. Among other things, this treatment shows that laser illumination of a monochromator entrance slit must be nearly on-axis to avoid serious slit-scattering function distortions. Finally, the relationships between the cross-spectral density function and the classical radiometric quantities, such as spectral radiance are presented. (21 refs.)

111383 Self-study manual on optical radiation measurements: Part III - Applications, chapter 1. Measurement of solar terrestrial spectral irradiance in the ozone cut-off region. H.J.Kostkowski, R.D.Saunders, J.F.Ward, C.H.Popenoe, A.E.S.Green. **Report NBS-TN-910-5**, Nat. Bur. Stand., Washington, DC, USA (Dec. 1982), xii+80 pp.
Material developed in earlier chapters is used to perform state-of-the-art measurements in Gainesville, Florida, of solar terrestrial spectral irradiance between 290 and 340 nm. The measurement equation is used to design the experiment and to address the effects of polarization, non-linearity, spectral scattering, distortion, slit-scattering function, spectral irradiance calibration, and wavelength calibration. Estimates are made of the uncertainties associated with all these factors. The total uncertainty is estimated to be about 10 percent. An appendix includes details for computing the solar terrestrial spectral irradiance between 280 and 310 nm. Suggestions are made for reducing the uncertainty by about one third and for further research in UV solar terrestrial measurements. (26 refs.)

01.65 HISTORY OF SCIENCE

111384 Transuranium research in Germany 1939 to 1945. K.Starke (Philips-Univ., Marburg, Germany). *Atomkernenerg. Kerntechnik. (Germany)*, vol.41, no.4, p.264-6 (1982). [received: Sept. 1983]
The first nuclear reactor became self-sustaining in Chicago on December 2, 1942. The 40th anniversary of this event gives occasion to recollect the German reactor project. The failure to achieve, after a promising beginning, a uranium-graphite pile also in Germany is discussed. (29 refs.)

111385 Computers and philosophical lexicography: the activities of the Lessico Intellettuale Europeo. A.Lamarra (Lessico Intellettuale Europeo, Rome, Italy). *Comput. & Hum. (Netherlands)*, vol.16, no.4, p.223-8 (Dec. 1982).
Discusses some activities of the research institute, Lessico Intellettuale Europeo in text analysis of philosophical and scientific works. The use of computers in two distinct areas is noted: the integrated analysis of texts so that lexicons can be compiled, of an author's complete works or of a single text; the establishment of a database to support the Thesaurus Mediae et Recentioris Latinitatis and the Dizionario Filosofico del Seicento e del Settecento. (18 refs.)

111386 October 8, 1958—first pacemaker implantation: a milestone in medical history. G.Bartels. *Electromedica (Germany)*, vol.51, no.3, p.119-21 (1983).
The first implantable cardiac pacemaker was developed by Siemens-Elema, Stockholm (then Elema-Schonander), and implanted in a patient on October 8, 1958. Dr. Rune Elmqvist, Elema, developed this cardiac pacemaker at the suggestion of Dr. Ake Senning, surgeon at the Karolinska Hospital in Stockholm. The pacemaker had silicon transistors and a nickel-cadmium battery. (no refs.)

111387 The relics of physics. B.Elbek (Niels Bohr Inst., Copenhagen, Denmark). *Phys. Scr. (Sweden)*, vol.T5, p.143-4 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
Discusses the lack of relics from famous discoveries in physics such as Newton's apple and Archimede's bathtub. (no refs.)

111388 The introduction of wave optics: the Fresnelian explanation of diffraction. J.J.Saldana (Facultad de Filosofia y Letras, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico). *Rev. Mex. Fis. (Mexico)*, vol.29, no.3, p.419-47 (May 1983). In Spanish. [received: Sept. 1983]
The paper is concerned with the historical and scientific context in which the wave theory of light was introduced in the early 19th century in France. In particular, the political and scientific activity is analyzed to understand the emergence of Fresnel's undulatory explanation of diffraction phenomena. The opposition of the partisans of the 'theorie de l'emission' is analyzed too. The aim of the paper is to show the methodological relevance of the social history of science, in the historical explanation of science. (58 refs.)

01.70 PHILOSOPHY OF SCIENCE

Computers and philosophical lexicography: the activities of the Lessico Intellettuale Europeo See Entry 111385

01.90 OTHER TOPICS OF GENERAL INTEREST

111389 Structure of system rule of structure formation in steps, application of the new rule, and primary design of data center system. H.Kato, Y.Hori, T.Hata, T.Yamamoto, Y.Yamada, T.Muta. *Rep. Gov. Ind. Res. Inst. Nagoya (Japan)*, vol.32, no.5-6, p.105-16 (May-June 1983). In Japanese.
The authors propose a new concept of structure formation of science and technology. And the history of science and technology was analyzed by applying the new concept. As a result, a new rule on the structure formation of science and technology was found out. The new method that was applied to formulate the structure of science and technology in steps was developed by applying the new rule and primary design of data center system for ceramic studies was finished. (23 refs.)

111390 Mechanics of maneuvering aircraft by rotation of the thrust vector. I.F.Obraztsov, V.F.Pavlenko, A.I.Nelyubov (N.E. Zhukovskii Air Force Engng. Acad., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1027-9 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1327-30 (Dec. 1982). [received: Sept. 1983]
Technical progress in constructing aircraft and especially in constructing engines has permitted the production of vertical takeoff and landing aircraft (VTOLA) with useful flight characteristics, whose propulsion unit includes, as a rule, extra-lift engines (ELE) with rotation of the thrust vector upward from the longitudinal axis of the aircraft through an angle greater than $\pi/2$. With some modifications of the turning system, the rotation of the ELE thrust vector can be used not only to provide for vertical takeoff and landing but also to improve maneuverability in flight. (2 refs.)

02.00 MATHEMATICAL METHODS IN PHYSICS

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

111391 [n,n-1] Pade' approximants=N term borel integral for frequency dependent polarizability. G.C.Shukla (Dept. of Biophys., AIIMS, New Delhi, India). *Indian J. Phys. Part B*, vol.57B, no.3, p.264-6 (June 1983).
Dispersion force computations take recourse to Pade' approximants to construct a converging sequence of Pade' bounds (lower and upper) i.e. $[n,n-1]$, knowing its Cauchy moments. Also a related method the method of Borel (Langhoff and Karplus 1970) and numerical methods to solve the relevant set of equations were provided by the authors (Yousif and Shukla 1980, Yousif 1979). In earlier work (Yousif and Shykla 1980), the equivalence of $n=3$ term Borel integral has been established with $[3,2]$ Pade' approximants numerically. The aim of the present note is to give an algebraic proof for such an equivalence for $n=3$. Nevertheless, the proof can be extended to any order of n . (8 refs.)

111392 On the inversion of the commutation operator. M.Bruschi, O.Ragnisco (Istituto di Fisica, Univ. di Roma, Rome, Italy). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.2, p.41-4 (10 Sept. 1983).
The authors display the explicit form of the inverse of the commutation operator $[A, \cdot]$, A being a matrix of arbitrary dimension with simple characteristic roots. (1 ref.)

111393 Lie algebras whose maximal subalgebras are modular. V.R.Varea (Dept. of Algebra, Univ. of Zaragoza, Zaragoza, Spain). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.94, pt.1-2, p.9-13 (1983).
A subalgebra M of a Lie algebra L is called modular in L if M is a modular element in the lattice of the subalgebras of L . The author studies the finite-dimensional Lie algebras, all of whose maximal subalgebras are modular. The author characterizes these algebras over any field of characteristic zero. (11 refs.)

02.20 GROUP THEORY
(for algebraic methods in quantum mechanics, see 03.65; for symmetries in elementary particle physics, see 11.30)

111394 Method of recurrent construction of Lowdin spin-adapted wave functions. III. Lowdin basis and its permutation symmetry: evaluation of overlap integrals. A.I.Panin (Chem. Dept., Leningrad State Univ., Leningrad, USSR). *Int. J. Quantum Chem. (USA)*, vol.24, no.3, p.279-306 (Sept. 1983).
For pt.II see *ibid.*, vol.22, p.1177 (1982). The Lowdin basis functions are introduced and their permutation symmetry is studied in detail. A simple relation between the Lowdin basis and the orthogonal basis constructed by means of Young-Yamanouchi units is established. Both analytical and recurrence formulas for the overlap integrals of the Lowdin and some relevant auxiliary functions are derived. The symmetry of the overlap matrix of the Lowdin basis functions is briefly discussed. (26 refs.)

111395 Site symmetry, interchange symmetry, and projection operators in non-rigid symmetry groups. R.L.Flurry,Jr. (Dept. of Chem., Univ. of New Orleans, New Orleans, LA, USA). *Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983* (Amsterdam, Netherlands: Elsevier 1983), p.113-32. Groups involving more than one generating element can be constructed as products of groups defined by independent generators. The use of the Frobenius reciprocity theorem allows the correlation of the irreducible representations of the subgroups with those of the full group. Projection operators within the full group can be constructed as products of the projection operators of the subgroups. The correlations and the projection operators are independent of the types of product involved in the group structure. A particularly useful factorization for point groups involves factoring the group into the site symmetry group and the interchange symmetry. Symmetry-adapted functions can be constructed by applying the projection operators of the site symmetry group to the basis functions centered on a site to obtain functions adapted to the site symmetry, and then by applying the projection operators from the interchange symmetry to these, to obtain functions adapted to the full group. When the site and interchange symmetries are properly defined, the procedure works equally well for non-rigid systems, even though the interchange symmetry may not define a group. The technique is presented in detail and applied to the construction of symmetry-adapted functions for several non-rigid molecules. (7 refs.)

02.30 FUNCTION THEORY, ANALYSIS

111396 ILUCG2: subprograms for the solution of a linear asymmetric matrix equation arising from a 9-point discretization. A.I.Shestakov, D.V.Anderson (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.31-6 (July-Aug. 1983).

Elliptic and parabolic partial differential equations which arise in plasma physics applications (as well as in others) are solved in two dimensions. Plasma diffusion, equilibria and phase space transport (Fokker-Planck equation) have been treated by these methods. These problems share the common feature of being stiff and requiring implicit solution techniques. Generally, the resulting matrix equations are asymmetric; the authors solve them here with the ILUCG2 program. (9 refs.)

111397 ICCG2: subprograms for the solution of a linear symmetric matrix equation arising from a 9-point discretization. D.V.Anderson, A.I.Shestakov (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.37-42 (July-Aug. 1983).

Elliptic and parabolic partial differential equations which arise in plasma physics applications (as well as in others) are solved in two dimensions. Plasma diffusion, equilibria and phase space transport (Fokker-Planck equation) have been treated by these methods. These problems share the common feature of being stiff and requiring implicit solution techniques. Sometimes, the resulting matrix equations are symmetric; the authors solve them here with the ICCG2 coding. (8 refs.)

111398 ILUCG3: subprograms for the solution of a linear asymmetric matrix equation arising from a 7, 15, 19 or 27 point 3D discretization. D.V.Anderson (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Comput. Phys. Commun. (Netherlands), vol.30, no.1, p.43-9 (July-Aug. 1983). Elliptic and parabolic partial differential equations which arise in plasma physics applications (as well as in others) are solved in three dimensions. Plasma diffusion, equilibria and phase space transport (Fokker-Planck equation) have been treated by similar methods in two dimensions using the codes ICCG2 and ILUCG2. These problems share the common features of being stiff and requiring implicit solution techniques. Generally, the resulting matrix equations are asymmetric; the authors solve them here with the ILUCG3 program. (8 refs.)

111399 ICCG3: subprograms for the solution of a linear symmetric matrix equation arising from a 7, 15, 19 or 27 point 3D discretization. D.V.Anderson (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.51-7 (July-Aug. 1983).

Elliptic and parabolic partial differential equations which arise in plasma physics applications (as well as in others) are solved in three dimensions. Plasma diffusion, equilibria and phase space transport (Fokker-Planck equation) have been treated by similar methods in two dimensions using the codes ICCG2 and ILUCG2. These problems share the common features of being stiff and requiring implicit solution techniques. Sometimes, the resulting matrix equations are symmetric; the authors solve them here with the ICCG3 program. (8 refs.)

111400 On a local hidden-variable model with unusual properties. G.C.Scalera (Istituto Nazionale di Geofisica, Roma, Italy).

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.1, p.161-8 (3 Sept. 1983). Shows that a local hidden-variable model exists which violates Bells inequality (1964). The correlation function depends on the definition of the time of coincidence, are obtained for arbitrarily small times of coincidence. (no refs.)

111401 On the isospectral-eigenvalue problem and the recursion operator of the Harry-Dym equation. M.Leo, R.A.Leo, G.Soliani, L.Solombrino (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy).

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.2, p.45-51 (10 Sept. 1983). The isospectral-eigenvalue problem for the Harry-Dym equation is derived using a prolongation technique. The eigenvalue equation is then exploited to find a recursion operator. (21 refs.)

111402 A study of fast Laplace transform. K.Kanematsu, A.Ametani (Dept. of Electrical Engng., Doshisha Univ., Kyoto, Japan). *Sci. & Eng. Rev. Doshisha Univ. (Japan)*, vol.24, no.1, p.41-9 (May 1983). In Japanese.

The weighting function and shifting constant of integral path of the FLT (fast Laplace transform) were investigated. As the result, the meanings of the weighting function and the characteristic of the error due to the shifting constant of the integral path have been made clear. The reason why the FLT does not show an aliasing error was studied, and it became clear that because time functions used in the FLT are causal function, no aliasing error appears. Furthermore, the error of the FLT was investigated. The pair of the FLT was studied, and a linear-approximation Laplace transform (LLT) has been developed as the pair of the FLT. The FLT-LLT pair is not a perfect transform-pair. But, because both transforms have no aliasing error, the error due to the FLT-LLT pair is very small. (6 refs.)

111403 Lattice theoretic properties of Carleson measures. C.Matsuoka (Dept. of Mech. Engng., Doshisha Univ., Kyoto, Japan). *Sci. & Eng. Rev. Doshisha Univ. (Japan)*, vol.24, no.1, p.63-8 (May 1983). In Japanese.

On a given compact Hausdorff space, the author investigates the decomposition property of measures with respect to an arbitrary max-stable convex subcone of continuous functions. The result can be applied to Carleson measures on the unit disk, which leads to another proof of Pehr Beurling's theorem. (8 refs.)

111404 The method of spherical harmonics for the transfer equation. V.Yu.Plyashkevich (I.V. Kurchatov Inst. of Atomic Energy, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1018-24 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1098-102 (Dec. 1982). [received: Sept. 1983]

The author discusses the result of an investigation of a system of equations by the method of spherical harmonics, formulates for the system correct boundary conditions that correspond to the general laws of boundary reflection of radiation emerging from the region, and establishes convergence of the method. (4 refs.)

111405 Complex geometry and integral representations in the future tube in C^1 . A.G.Sergeev.

Theor. & Math. Phys. (USA), vol.54, no.1, p.62-70 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.99-110 (Jan. 1983). [received: Sept. 1983]

It is shown that the boundary of the future tube in C^3 cannot be holomorphically rectified along complex light rays lying on the boundary. From the general Cauchy-Fantappie representation the Cauchy-Bochner, Jost-Lehmann-Dyson, Leray, and other integral representations for holomorphic function and solutions of the $\bar{\alpha}$ equation in the future tube are derived. 02.50 PROBABILITY THEORY, STOCHASTIC PROCESSES, AND STATISTICS

(see also 05. Statistical physics)

111406 Parsimonious asymptotics. D.Ludwig. <i>SIAM J. Appl. Math. (USA)</i> , vol.43, no.4, p.664-72 (Aug. 1983). There appears to be a connection between parsimony in construction of an asymptotic approximation, and robustness of the result. This point is illustrated by two examples from widely different fields: (1) Keller's geometric theory of diffraction, with special reference to approximations for eigenvalues, and (2) maximum likelihood estimators for simple vs. complex models of fishery dynamics. (7 refs.)	
111407 Transformations to linearity in binary regression. A.S.White-moore (Dept. of Family, Community & Preventive Medicine, Stanford Univ. School of Medicine, Stanford, CA, USA). <i>SIAM J. Appl. Math. (USA)</i> , vol.43, no.4, p.703-10 (Aug. 1983). A one-parameter family of transformations for binary response probabilities is introduced. The family is used to explore relationships between response and explanatory variables by assuming that the transformed probabilities depend linearly on the known variables and on unknown parameters reflecting the variables' effect on response. The family includes the logistic and one-hit transformations, which form the bases for two popular notions of 'no interaction' between explanatory variables. Maximum likelihood methods are used to determine those transformations in the family that provide acceptable fits to data, and the methods are illustrated with data from an animal cancer bioassay. The paper concludes with a comparison of probabilistic and statistical properties of logistic and one-hit transformations. (18 refs.)

02.60 NUMERICAL APPROXIMATION AND ANALYSIS

111408 Economical stiffness formulations for nonlinear finite elements. R.A.Brockman (Res. Inst., Univ. of Dayton, Dayton, OH, USA). <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.15-22 (1984). Element-level calculations often represent a significant part of the computing effort in a nonlinear finite element solution, especially when three-dimensional, higher-order elements are used. This paper explores some possibilities for increasing the efficiency of element computations within the general framework of a Newton-Raphson solution technique. A modified tangent stiffness formulation is introduced which provides relatively fast convergence without the extreme computational effort sometimes associated with the usual Newton-Raphson interaction. Numerical examples are used to illustrate the behavior of the method. The use of different types of element formulations within a single finite element mesh, according to the expected or observed degree of nonlinearity, is also identified as a means of reducing solution cost. (14 refs.)	
--	--

111409 On the choice of a cost function for the reconstruction of surfaces by triangulation between contours. W.R.J.Funnell (Dept. of Otolaryngology, McGill Univ., Montreal, Quebec, Canada). <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.23-6 (1984). Methods for the reconstruction of three-dimensional objects by triangulating between pairs of two-dimensional contours are discussed. Alternative cost functions for optimizing the triangulation are considered, and new cost functions are proposed that measure the narrowness of the triangles. These narrowness functions are particularly well suited to the generation of finite-element meshes. (15 refs.)	
111410 Anchorage plates for Cable-Stayed bridges. C.P.Heins, K.Kano (Dept. of Civil Engng., Univ. of Maryland, College Park, MD, USA). <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.47-54 (1984). The design of Cable-Stayed bridges requires the engineer to examine in detail the local force distribution in the plates which transfer the cable force to the main structure. It is therefore the intention of this paper to present the response of these plate elements, when subjected to the cable forces, using the finite element method. The results are presented such that rapid evaluation of their strength can be determined. (7 refs.)	
111411 Automatic node resequencing with constraints. L.V.Quoc, J.R.O'Leary (Dept. of Civil Engng., Illinois Inst. of Technol., Chicago, IL, USA). <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.55-69 (1984). Presented here is an algorithm for finite element node resequencing to reduce the bandwidth and profile of the resulting matrices while taking into account node constraints. Particular attention is given to the fluid-solid interaction problem with added-mass, the analysis with linear constraint equations, and the static condensation by partial decomposition. In the aforementioned applications, additional relationships (constraints) between the degrees of freedom must be considered in the renumbering process since they usually lead to an increase in the matrix configuration. A description of the above mentioned applications is presented as well as the implementation of the proposed algorithm to these problems on a small rectangular mesh in order to clearly illustrate its functioning. Finally, the algorithm is applied to larger, more realistic examples; these results show that the algorithm performs remarkably well, chiefly in achieving an optimal configuration for both the mass (augmented) and the stiffness matrices in the context of the fluid-solid interaction analysis. (29 refs.)	
111412 Harmonic acceleration method for dynamic structural analysis. I.Senjanovic (Faculty of Mech. Engng. & Naval Architecture, Univ. of Zagreb, Zagreb, Yugoslavia). <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.71-80 (1984). The harmonic acceleration is assumed in each time step of integration of the dynamic equilibrium equation of a structure and its modal transformation. As a result of this two different numerical integration methods have been derived. Both the methods are unconditionally stable and very accurate compared to some other commonly used methods. (16 refs.)	
111413 Finite strip method with X-spline functions. H.Y.Yang (Dept. of Basic Sci., Tianjin Univ., Tianjin, China), K.P.Chong. <i>Comput. & Struct. (GB)</i> , vol.18, no.1, p.127-32 (1984). An alternative method of finite strip is developed by using cubic X-spline functions in the y-direction instead of trigonometric series. The main advantage of the method is to be able to solve the problems defined in some irregular shaped regions. Numerical examples have shown that the new method, as well as the original one developed by Cheung, is superior to the Finite Element Method in saving the computational labor. (8 refs.)

- 111414 Formulation of equations of motion for multi-rigid-body systems.** Shen Qianruo (Peking Inst. of Aeronautics & Astronautics, Peking, China). *Acta Mech. Sin. (China)*, no.3, p.259-66 (1983). In Chinese. Deals with the formulation of dynamical equations for multi-rigid-body systems in a topological tree configuration. The author briefly analyses and compares various methods, vectorial and analytical, for deriving these equations. A new method is presented. Its feature is that the equations of motion are formulated by a series of matrix transformations. There are two key points in this method, the 'partial derivative of matrix' by means of which the application of equations of analytical dynamics in their matrix format becomes possible, and two basic matrices called the 'Incidence Matrix' and 'Mass-center-vector Matrix' which describe the structure of the system. The Kane-Wang quasi-coordinate formula is adapted. The general format of rotational equations appearing as a matrix equation has been established. The attitude equations of a multi-rigid-body satellite are given as an example. (9 refs.)
- 111415 Generalized dynamical equations for tree-shaped multi-rigid-body systems.** Zhou Qizhao (Peking Univ., Peking, China). *Acta Mech. Sin. (China)*, no.3, p.267-77 (1983). In Chinese. Following Wittenburg (1977) and utilizing the viewpoint of graph theory, the author analyses the structure for a tree shaped system of an arbitrary number of interconnected rigid bodies. The author describes a dynamical model of overlapping subtreeshaped structures and a definition of the so-called artery graph and modifies the idea of augmented bodies so that the equivalent dynamical decomposition of the system can be carried out. By specifying certain symbols and rules of calculation, generalized dynamical equations for the tree-shaped multi-rigid-body system are set up in a rather compact matrix form. Thus, after introducing the hinge matrix, both the constraint relations and the kinematics of the system are written in matrix form. Finally the dynamical equations are expressed in terms of generalized coordinates so that they can be used for computer programming. (5 refs.)
- 111416 First integrals for one-dimensional particle motion in a non-linear, time-dependent potential field.** W.Sarlet (Inst. voor Theoretische Mech., Rijksuniv. Gent, Gent, Belgium). *Int. J. Non-Linear Mech. (GB)*, vol.18, no.4, p.259-68 (1983). Following a direct ad hoc procedure for the construction of first integrals established previously (see *ibid.*, vol.15, p.133-46, 1980) all potentials $V(q,t)$ are derived for which an equation of type $\ddot{q} + \partial V / \partial q = 0$ has a first integral, quadratic in \dot{q} . Polynomial non-linearities are focussed on and a characterization of all admissible equations is given in terms of an arbitrarily assigned coefficient of the highest order term. Adiabatic invariants are discussed for which the unusual feature is that the highest nonlinear term again is dominating and linear terms are comparatively small. (11 refs.)
- 111417 Torsional vibrations of a non-shallow spherical sandwich shell.** C.Prasad, A.P.Gupta (Dept. of Maths., Univ. of Roorkee, Roorkee, India). *Proc. Natl. Acad. Sci. India Sect. A*, vol.52, pt.1, p.89-94 (1982). [received: Aug. 1983] Free torsional vibrations of a non-shallow spherical sandwich shell are considered by taking into account the effects of transverse shear and rotatory inertia for the core as well as for the facings. The equations of motion derived by the Hamilton energy principle are solved in terms of a Legendre function with the aid of auxiliary variables. Frequencies computed for the first four normal modes of vibrations of sandwich shells are compared with those of monocoque shells. (10 refs.)
- 111418 Stability of collinear solutions in the restricted problem of three bodies with variable mass.** A.K.Srivastava, B.Ishwar (Dept. of Math., Bihar Univ., Muzaffarpur, India). *Proc. Natl. Acad. Sci. India Sect. A*, vol.52, pt.2, p.163-7 (1982). [received: Aug. 1983] The authors have examined the stability of collinear solutions of the restricted problem of three bodies with variable mass by the method adopted by Moulton. The authors have found three variational equations. The last equation is independent of the first two equations. The characteristic equation for the first two equations is biquadratic. The authors have discussed the different cases which give the condition for the collinear solution to be stable or unstable. They come to the conclusion that the collinear solutions are, in general, unstable. (7 refs.)
- 111419 A theory of exact and approximate configurational invariants.** L.S.Hall (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Physica D (Netherlands)*, vol.8D, no.1-2, p.90-116 (July 1983). A theory of integrable Hamiltonian systems in two dimensions is formulated and applied. The four-dimensional phase-space problem that is the vanishing of the Poisson bracket between another invariant and the Hamiltonian is reduced to the solution of a series of two-dimensional configuration-space equations. (The theory is also applicable to more than two dimensions.) The constraints are found which admit to integrability of the orbits for magnetic or Coriolis forces as well as for forces derivable from a potential. When a system admits a given invariant, the invariant is found—for example, by quadrature. A number of examples including known and apparently previously unknown invariants are given. The theory of exact integrals of the motion

also can be extended to the derivation of approximate invariants. The orbital structure of integrable or approximately integrable systems correlates with the degree (maximum power of the velocity) of a standardized invariant. The theory admits a variational principle, among other approximation techniques, for the computation of a 'best' approximate invariant. The problem of the general cubic potential with one symmetric coordinate, $V = \frac{1}{2}Ax^2 + \frac{1}{2}By^2 + Cx^2y + \frac{1}{3}Dy^3$ (of which the well-studied Henon-Heiles potential is the special case for $A=B$ and $C=-D$), is examined in detail. (19 refs.)

- 111420 Infinite bifurcations, gaps and bubbles in Hamiltonian systems.** G.Contopoulos (European Southern Obs., Garching, Germany). *Physica D (Netherlands)*, vol.8D, no.1-2, p.142-56 (July 1983). The author studies the bifurcations, gaps and bubbles along the characteristics of families of periodic orbits in Hamiltonian systems of two degrees of freedom. Bubbles (closed characteristics) appear when the rotation number along a family does not vary monotonically. There are infinite bifurcations, appearing when the rotation number along a family is rational, n/m . The most important bifurcations have $m=1$, or $m=2$ (equal period and double period bifurcations). In a rotating system the central family of periodic orbits is the family of direct circular orbits of the axisymmetric case. At each bifurcation $n/1$ there is either a change of stability (if n is odd), or a gap (if n is even) of the central family; this phenomenon is explained theoretically. In cases of infinite transitions from stability to instability along the same family, the successive intervals between bifurcations do not follow the universal Feigenbaum ratio. But the author also found several cases of infinite pitchfork period doubling bifurcations, and in all cases the Feigenbaum ratio is consistent with the universal value $\delta=8.72$. All Feigenbaum sequences in rotating systems are followed by inverse Feigenbaum sequences, i.e. they form infinite bubbles. An explanation of this effect is given. (16 refs.)
- 111421 The Benettin-Strelcyn oval billiard revisited.** M.Henon (Obs. de Nice, CNRS, Nice, France), J.Wisdom. *Physica D (Netherlands)*, vol.8D, no.1-2, p.157-69 (July 1983). The wall of the oval billiard defined by Benettin and Strelcyn (1978) has a discontinuous curvature; the associated mapping has a discontinuous derivative. The authors find that invariant curves of the mapping are generally destroyed when they cross a line of discontinuity. They can survive, however, in particular cases where two successive discontinuities cancel each other. (9 refs.)
- 111422 The analytic structure of dynamical systems and self-similar natural boundaries.** Y.F.Chang, J.M.Greene, M.Tabor, J.Weiss (Center for Studies of Nonlinear Dynamics, La Jolla Inst., La Jolla, CA, USA). *Physica D (Netherlands)*, vol.8D, no.1-2, p.183-207 (July 1983). The authors investigate the analytic, complex-time structure of the movable singularities for several dynamical systems. In general, it is found that there exists a direct connection between the occurrence of a certain type of multiple-valuedness of the singularities and the existence of a class of remarkable, 'self-similar' natural boundaries for these systems. An asymptotic description of the distribution of singularities in the natural boundary is developed. This provides a description of the fine-scale structure of these natural boundaries that agrees closely with the numerical calculations. (12 refs.)
- 111423 Some symmetric, two-dimensional, dissipative maps.** J.Froyland (Inst. of Phys., Univ. of Oslo, Oslo, Norway). *Physica D (Netherlands)*, vol.8D, no.3, p.423-34 (Sept. 1983). A class of simple, symmetric, two-dimensional maps have been studied theoretically, and one finds periodic N doubling at values of a parameter of the form $\cos(\pi k/N)$. A computer simulation confirms this, and it is also found that in general there are only a finite number of successive period doubling generations. Finite jump (first order) transitions are shown to take place. (6 refs.)
- 111424 Shock and transition layers for singularly perturbed second-order vector systems.** R.E.O'Malley, Jr. (Dept. of Math. Sci., Rensselaer Polytech. Inst., Troy, NY, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.935-43 (Aug. 1983). Considers boundary value problems for certain vector systems of the form $\Omega(\epsilon)y' + f(x,y)y' + g(x,y) = 0$ with $y(0)$ and $y(1)$ prescribed, in the limit as the coefficient matrix Ω tends to zero. Emphasis is on specific two-dimensional examples with limiting solutions displaying jumps at interior points which are not obvious prior to analysis. (17 refs.)
- 111425 A transformation method of non-Hamiltonian system and its application.** Liu Lin, Zhang Shenpan (Dept. of Astron., Nanjing Univ., China). *Sci. Sin. (China)*, vol.26, no.8, p.861-73 (Aug. 1983). A transformation method of non-Hamiltonian systems was presented by Liu Lin (*Acta Astron. Sin.*, vol.23, p.255, 1982). In this paper, this method is concretized, and the principle, process and forms of two kinds (the forms of the implicit function and the explicit function) of the method are discussed in detail, with the motion solution of a small celestial body under the oblateness perturbation of a principal celestial body given as an example. (4 refs.)
- 111426 Almost asymptotic stability of system of processes.** A.A.Martynyuk, V.D.Podil'chuk (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Appl. Mech. (USA)*, vol.19, no.1, p.74-9 (Jan. 1983). Translation of: *Prikl. Mekh. (USSR)*, vol.19, no.1, p.89-94 (Jan. 1983). [received: Sept. 1983] The study is a continuation of one begun earlier (see A.A. Martynyuk, *Prikl. Mekh.*, vol.16, no.6, p.104-9, 1980). The state of a system of processes is characterized by a multidimensional functional (vector measure) and the problem of an almost asymptotic stability of such a system with respect to two vector measures is considered on this basis. An essential distinguishing feature of this study is that the components of a vector measure can have positive as well as negative values. The concept of vector measure is a generalization of the concept of measure and, as far as these authors know, has not been used before in the problem of practical stability. (7 refs.)

03.30 SPECIAL RELATIVITY

111427 Energy conserving non-relativistic guiding center mechanics and the Galilean principle of relativity. H.K.Wimmel (Max-Planck-Inst. fur Plasma-phys., EURATOM Assoc., Garching, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.841-7 (Aug. 1983). Arguments and representative examples are given that exact energy conservation and Galilei invariance are incompatible in non-relativistic guiding-center mechanics. Provided that this is true in general it also follows that exact energy conservation and Lorentz invariance are incompatible in relativistic guiding-center mechanics. It would furthermore follow that every guiding-center mechanics with exact energy conservation is a non-unique theory owing to the principle of relativity. The paper also presents a Galilei invariant guiding-center mechanics that does not conserve energy. (9 refs.)

111428 Lie-isotopic lifting of the special relativity for extended deformable particles. R.M.Santilli (Inst. for Basic Res., Cambridge, MA, USA). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.16, p.545-55 (20 Aug. 1983). The author recalls the variation of the speed of light with the local physical conditions of the material media in which it propagates, and identify a corresponding class of generalised metrics. The underlying group of isometries is constructed via a Lie-isotopic lifting of the envelope, algebra and group structure of Lorentz transformations. It is shown that the generalised transformations, called Lorentz-isotopic, are apparently capable of characterizing an isotopic lifting of the special relativity for extended, and therefore deformable particles. The current experimental information on the apparent approximate character of the conventional Lorentz transformations in particle physics are reviewed, and a number of direct tests suitable for the resolution of the issue are indicated. (28 refs.)

111429 A myth for special relativity. L.Epstein. *New Sci. (GB)*, vol.99, no.1374, p.690-2 (8 Sept. 1983). The author states that the ultimate reality in physics is not an equation but a myth. He points out that even expert physicists think in terms of various myths; for example, the Second Law of Thermodynamics interpreted as a natural tendency for things to get messed up. A good myth, in the sense meant by the author, must be easy to understand. It must explain what is found in nature, and what is deduced from the myth must also be found in nature. The author presents a myth to explain time dilation and the twins paradox: he describes a situation in which a clock properly moves through time, not space. If it also moves through space, it has to divert some of the energy used for travelling through time, and so a clock travelling in space at sufficiently high speed will stop travelling in time. (no refs.)

111430 Quantum mechanics of predictive Poincare-invariant systems. II. Mixed spin ($1/2,0$) two-particle systems. L.Bel (Inst. Henri Poincare, Paris, France). *Phys. Rev. D (USA)*, vol.28, no.6, p.1308-25 (15 Sept. 1983). The author discusses the problem of quantizing mixed spin (0 and $1/2$) two-particle systems in the framework of predictive relativistic mechanics. They propose a general scheme for quantization, but a detailed analysis is given only for the linearized scalar or vector interactions (with short or long ranges). Approximate wave equations are derived for the electromagnetic interaction in the cases where the particles are slowly moving or have very different masses. (26 refs.)

111431 Problems in special relativity. I.McCausland (Dept. of Electrical Engng., Univ. of Toronto, Toronto, Ontario, Canada). *Wireless World (GB)*, vol.89, no.1573, p.63-5 (Oct. 1983). Arguments have been used to defend the special theory of relativity against criticism contain many inconsistencies. These problems should be thoroughly and objectively examined by scientists and philosophers to attempt to ascertain the truth of the matter. (19 refs.)

03.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

111432 Optimization of a quadratic performance index on solutions of nonlinear two-point boundary-value problems. V.V.Vanisovich. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.556-8 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.697-9 (1982). [received: Sept. 1983]

A problem of optimizing nonlinear systems with boundary conditions of general form and a quadratic performance index is examined. Conditions for the existence of an optimal control are formulated. The optimal controls are written in explicit form as functions of the phase coordinate and the solutions of auxiliary boundary-value problems. Various applied problems of mechanics lead to the determination of optimal modes of the systems examined. (10 refs.)

111433 A simple algorithm for the nonlinear dynamic analysis of networks. P.G.Papadopoulos (Faculty of Structural Engng., Univ. of Thessaloniki, Thessaloniki, Greece). *Comput. & Struct. (GB)*, vol.18, no.1, p.1-8 (1984). A simple and economical algorithm is presented for the nonlinear dynamic analysis of networks, with lumped masses on the nodes, bars obeying uniaxial stress-strain laws and no damping. The step-by-step algorithm of the trapezoidal rule is used, combined with the predictor-corrector technique, with only two corrections per step. The prediction of an upper-bound for the eigenfrequencies permits the use of a constant steplength throughout the whole algorithm. An example problem and an error analysis of the algorithm are presented. (5 refs.)

111434 A partitioned finite element method for dynamical systems. A.Maher, P.G.Kessel, R.D.Cook (Univ. of Wisconsin, Madison, WI, USA). *Comput. & Struct. (GB)*, vol.18, no.1, p.81-91 (1984). A new analytical method is described for deriving the equations of motion of dynamical systems. The concept is to consider the displacements of the domain to be composed of rigid and elastic components. In contrast to other reduction methods, the domain modeled by finite number of degrees of freedom is discretized into two distinctive types of subdomains. Rigid and elastic subdomains are generated by consistent lumping of the domain properties under unique kinematic constraint relations. Equations of motion of the disjoint subdomains are derived by Lagrange's equations, in conjunction with the shape function matrix represented in partitioned form. This allows reduced size of matrices and avoids their possible singularities. Based on the invariance of energies under a compatible partitioned procedure, a simple analytical method is introduced for building the equations of motion of the whole domain from those of the subdomains. The dynamic analysis of a two-node domain with application to a blade-shaft combination is presented to illustrate the method. (15 refs.)

111435 Galerkin method as a tool to investigate the planar and nonplanar behavior of curved beams. A.Rosen, H.Abramovich (Dept. of Aeronaut. Engng., Technion-Israel Inst. of Technol., Haifa, Israel). *Comput. & Struct. (GB)*, vol.18, no.1, p.165-74 (1984). The equations of equilibrium which describe the three-dimensional behavior of curved beams are derived. These equations include first order geometric non-linear influences. The equations are solved by the Galerkin method. The method is very general and allows general variation of the geometric and structural properties along the beam. Any combination of boundary conditions is possible and the most general distribution of loads along the beam can be treated. Numerical results for a few examples are presented and compared to other theoretical and experimental results. The agreement between the results is generally good. It is shown that Galerkin method is an efficient method which enables one to solve the problem using small number of unknowns compared to other methods which are in use. (17 refs.)

03.40D Mathematical theory of elasticity (see also 46.20 Continuum mechanics, and 46.30 Mechanics of solids)

111436 The effective field method in linear problems of statics of composite media. S.K.Kanaun. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.520-8 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.655-65 (1982). [received: Sept. 1983]

A composite material consisting of a homogeneous matrix containing a random, spatially homogeneous set of ellipsoidal inclusions with different physical and mechanical properties is investigated. Statics are studied (such as electric, elastic, stationary temperature, etc.), induced in such a medium by the action of various specified external fields. The problem consists of determining the statistical moments of the random tensor-type functions of the flux density and field strength in the composite material in question. The problem of describing many important physical and mechanical properties of the heterogeneous materials can be reduced to that of solving the above problem. (17 refs.)

111437 Effective rigidities of composite plates. A.G.Kolpakov. *Appl. Math. & Mech. (USA)*, vol.46, no.4, p.529-35 (1982). Translation of: *Prikl. Mat. & Mekh. (USSR)*, vol.46, no.4, p.666-73 (1982). [received: Sept. 1983]

A problem of constructing the effective rigidities of composite plates, i.e. of the rigidities ensuring that the solutions of the initial problem of the three-dimensional theory of elasticity for an inhomogeneous body are close to a solution of some problem in the theory of quasihomogeneous plates, is investigated. The homogenization method is used to obtain the solution. The theory of plates employed has the following significant characteristic feature, namely the fact that mechanical hypotheses are used to execute the passage from the three-dimensional problem of the theory of elasticity to the two-dimensional problem of the theory of plates. The methods used explain the discrepancies occurring in various methods of constructing the effective characteristics. (15 refs.)

111438 Program to calculate elastic Green's functions, displacement fields and interaction energies in cubic materials. J.W.Deutz, H.R.Schober (Inst. fur Festkorperforschungsanlage Kernforschung Julich, Julich, Germany). *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.87-91 (July-Aug. 1983).

In linear elasticity theory a continuous medium is characterized by its Green's function. In the static case this Green's function can be calculated by a one-dimensional integration. Also calculated are the first two derivatives yielding displacement fields and interaction energies of point defects. (13 refs.)

111439 A stress versus compliance constraint in a minimum weight design. A.Zochowski (Systems Res. Inst., Warsaw, Poland), K.Mizukami. *Comput. & Struct. (GB)*, vol.18, no.1, p.9-13 (1984). The paper contains a study of the stress-constrained minimum-weight design of the beam in the framework of Zochowski et al. (ibid., vol.17, p.365, 1983). The existence of optimal shape is considered. The numerical examples are given and stress-constrained designs are compared to compliance-constrained ones. (8 refs.)

111440 Dynamic finite element analysis of nonaxisymmetric structures. A.R.Zak, A.D.Antartis (Dept. of Aeronaut. & Astronaut. Engng., Univ. of Illinois, Urbana, IL, USA). *Comput. & Struct. (GB)*, vol.18, no.1, p.33-9 (1984). A dynamic finite element method of analysis is developed for structural configurations which are derived from axisymmetric geometries but contain definite nonaxisymmetric features in the circumferential direction. The purpose of the analysis is to develop a method which will take into consideration the fact that the stress and strain conditions in these geometries will be related to the corresponding axisymmetric solution. This analysis is an extension of previously published work, Zak et al. (1978, 1979), in which a similar approach was developed for static structural problems. The analysis is developed in terms of a cylindrical coordinate system r, θ and z . As the first step of the analysis, the geometry is divided into several segments in the $r-\theta$ plane. Each segment is then divided into a set of quadrilateral elements in the $r-z$ plane. The axisymmetric displacements are obtained for each segment by solving a related axisymmetric configuration. A perturbation analysis is then performed to match the solutions at certain points between the segments, and obtain the perturbation displacements for the total structure. The total displacement is then the axisymmetric displacement plus the perturbation displacement. The analysis allows for elastic-plastic materials with orthotropic yield criterion based on Hill's yield function and kinematic strain hardening. The finite element dynamic equations are solved by finite differences by dividing the

time domain into incremental steps. The solution has been programmed on a computer and applied to a number of examples. (5 refs.)

111441 Solutions of plates on a heterogeneous elastic foundation. M.Witt (Inst. of Civil Engng., Wrocław Tech. Univ., Wrocław, Poland). *Comput. & Struct. (GB)*, vol.18, no.1, p.41-5 (1984). The solution of the problem of interaction of a plate with a two parameter elastic foundation is presented. Vertical displacements of rectangular plates having free edges resting on a heterogeneous elastic foundation have been analysed by using the finite element method. The heterogeneity of the foundation caused by the orthotropy has been taken into account when forming the equations of equilibrium and variable thickness of the foundation by approximating it by Haar's functions. The obtained results have been compared with the results for a homogeneous foundation. (6 refs.)

111442 Application of the quadratic functional to nonconservative problems of elastic stability. W.Altman (Inst. Tecnol. de Aeronautica, Sao Paulo, Brazil), A.M.de Oliveira. *Comput. & Struct. (GB)*, vol.18, no.1, p.141-5 (1984). Two methods for solving nonconservative problems by applying the quadratic functional are presented. The corresponding approximate methods of solution are obtained by using suitable polynomial trial functions and are illustrated by solving Beck's and Leipholz's rods. (4 refs.)

111443 Analyses of large quasistatic deformations of inelastic bodies by a new hybrid-stress finite element algorithm. K.W.Reed, S.N.Atluri (Center for the Advancement of Computational Mech., Georgia Inst. of Technol., Atlanta, GA, USA). *Comput. Methods Appl. Mech. & Eng. (Netherlands)*, vol.39, no.3, p.245-95 (Sept. 1983). The finite element algorithm is based upon a generalization of de Veubeke's (1972) complementary energy principle. The principal variables in the formation are the nominal stress rate and spin, and the resulting finite element equations are discrete versions of the equations of compatibility and angular momentum balance. The algorithm produces true rates, time derivatives, as opposed to 'increments'. There results a complete separation of the boundary value problem (for stress rate and velocity) and the initial value problem (for total stress and deformation); hence, their numerical treatments are essentially independent. After a fairly comprehensive discussion of the numerical treatment of the boundary value problem, the authors launch into a detailed examination of the numerical treatment of the initial value problem, covering the topics of efficiency, stability and objectivity. The paper is closed with a set of examples, finite homogeneous deformation problems, which serve to bring out important aspects of the algorithm. (70 refs.)

111444 An improved treatment of transverse shear in the Mindlin-type four-node quadrilateral element. A.Tessler (Structural Life Assurance Res., Northrop Corp., Hawthorne, CA, USA), T.J.R.Hughes. *Comput. Methods Appl. Mech. & Eng. (Netherlands)*, vol.39, no.3, p.311-35 (Sept. 1983). An improved displacement methodology based on Mindlin theory is developed and applied to a four-node, twelve degrees-of-freedom quadrilateral element. Special attention is directed toward enhancement of the transverse shear energy representation. Particularly, a nonuniform order kinematic interpolation scheme is accompanied by what is termed element appropriate shear correction factors. The element matrices are consistently derived from Hamilton's variational principle using exact numerical integration throughout. The element stiffness matrix possesses correct rank and is well conditioned over the entire Mindlin theory range of thickness-to-length ratios. Exceptionally good element performance is demonstrated by solutions to a set of static and vibrational problems. (21 refs.)

111445 On differential equations of nonlocal elasticity and solutions of screw dislocation and surface waves. A.C.Eringen (Princeton Univ., Princeton, NJ, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.4703-10 (Sept. 1983). Integropartial differential equations of the linear theory of nonlocal elasticity are reduced to singular partial differential equations for a special class of physically admissible kernels. Solutions are obtained for the screw dislocation and surface waves. Experimental observations and atomic lattice dynamics appear to support the theoretical results very nicely. (15 refs.)

111446 Nonlinear eigenvalue problems for the whirling of heavy elastic strings. II. New methods of global bifurcation theory. J.C.Alexander, S.S.Antman (Dept. of Math., Univ. of Maryland, College Park, MD, USA), Shi-tao Deng. *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.93, pt.3-4, p.197-227 (1983). For pt.1 see Arch. Rational Mech. Anal., vol.74, p.339-54 (1981). The authors treat the global qualitative behaviour of all bifurcating configurations of whirling nonlinearly elastic strings with ends fixed on the axis of rotation. (30 refs.)

111447 Continuous data dependence in linear elastodynamics on unbounded domains without definiteness conditions on the elasticities. G.P.Galdi, S.Rionero (Istituto di Matematica 'R. Caccioppoli', Naples, Italy). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.93, pt.3-4, p.299-306 (1983). By suitably coupling convexity and weight function methods, the authors prove uniqueness and continuous dependence theorems in linear elastodynamics in unbounded domains without definiteness conditions on the elasticities. The class of solutions considered allows the 'growth' at large spatial distances. (9 refs.)

111448 Estimates for solutions of the Dirichlet problem for the biharmonic equation in a neighbourhood of an irregular boundary point and in a neighbourhood of infinity: Saint-Venant's principle. V.A.Kondratiev, O.A.Oleinik (Moscow Univ., Moscow, USSR). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.93, pt.3-4, p.327-43 (1983). Energy estimates for solutions of the Dirichlet problem for the biharmonic equation, expressing Saint-Venant's principle in elasticity, are proved. From these integral inequalities, estimates for the maximum modulus of solutions and the gradient of solutions with homogeneous Dirichlet's boundary conditions in a neighbourhood of an irregular boundary point or in a neighbourhood of infinity are derived. These estimates characterize the continuity of solutions and their gradients at these points. (9 refs.)

03.40G Fluid dynamics: general mathematical aspects (see also 47. Fluid dynamics)

111449 A rigorous study of periodic orbits by means of a computer. S.De Gregorio (Istituto di Math., Università dell'Aquila, Aquila, Italy), E.Scoppola, B.Tirozzi. *J. Stat. Phys. (USA)*, vol.32, no.1, p.25-33 (July 1983). The authors apply a modified version of the method of Sinai and Vul (1980) in order to study, by means of a computer, a closed orbit which appears in the five-mode model of bidimensional incompressible fluid on the torus. (7 refs.)

111450 New splitting-up schemes for solving hyperbolic and parabolic non linear problems: applications to Euler and Navier-Stokes equations. P.Laval (ONERA, Chatillon, France).

Rech. Aerosp. (France), no.4, p.257-309 (July-Aug. 1983). In French. The most significant results obtained at ONERA over the last few years from the theoretical and numerical study of the splitting-up (disintegration) explicit method are presented. A general class of second-order splitting-up schemes is introduced for solving hyperbolic nonlinear problems. An 'optimal' scheme (defined as dissipative with minimal dissipation) is derived for solving a shock problem. It yields a numerically stable solution for this problem without any artificial viscosity. The results obtained from the computations of two-dimensional transonic flows with shocks show the significant improvements that can be expected from the sub-class of schemes, dissipative with minimal dissipation in each direction. The method is extended to the computations of three-dimensional unsteady non uniform flows in a turbo-machine. New classes of second order 'optimal' time splitting schemes (which allow optimal time steps) are also introduced for solving the Euler equations and the full time-dependent compressible viscous Navier-Stokes equations in fluid mechanics. The stability of the newly-derived schemes which is determined analytically shows that the present 'optimal' method should lead to considerably shorter computation times than the other existing explicit methods. (60 refs.)

111451 Logarithmic self-similar solutions. A.L.Brezhnev, I.A.Chernov (M.I. Kalinin Inst. of Agricultural Mechanization & N.G. Chernyshevskii State Univ., Saratov, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1011-12 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1331-3 (Dec. 1982). [received: Sept. 1983] Self-similar solutions of equations containing partial derivatives play an important role in various branches of fluid mechanics. The authors demonstrate a means of constructing solutions close to self-similar in three classical models: (1) in transonic gas dynamics; (2) in the theory of one-dimensional, nonstationary gas flows; (3) in boundary-layer theory. (3 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

111452 Propagation reflection and transmission of waves under initial shear stresses. S.Dey, S.P.Mukherjee (Dept. of Phys. & Math., Indian School of Mines, Dhanbad, India). *Int. J. Non-Linear Mech. (GB)*, vol.18, no.4, p.269-77 (1983). Deals with the study of propagation of Love waves and reflection as well as transmission of SH waves under initial shear stresses. The results have been computed taking two real media and presented graphically to compare with the initial stress-free cases. (16 refs.)

111453 Acceleration waves in elastic dielectrics with polarization gradient effects. S.Dost (Dept. of Mech. Engng., Univ. of Calgary, Calgary, Alberta, Canada). *Int. J. Eng. Sci. (GB)*, vol.21, no.11, p.1305-11 (1983). Investigates the propagation of acceleration waves of arbitrary form in a deformed elastic dielectric with polarization effects. An acceleration wave is defined as a second order propagating surface of discontinuity on which the position vector, the polarization vector and Maxwell potential, and their first order derivatives with respect to time and space coordinates are continuous while the second order derivatives of these quantities may suffer jumps but are continuous everywhere else. By computing the jumps of the balance equations on the singular surface implicit equations for wave speeds corresponding to non-zero amplitudes of the acceleration wave are obtained. It is noteworthy that the second order derivatives of Maxwell potential are also continuous across the acceleration wave. The same equation for wave speeds are also derived for isotropic elastic dielectrics. The wave speeds for longitudinal and transverse waves are obtained in explicit forms and the conditions of existence for real wave speeds are investigated. (17 refs.)

111454 Nonlinear lattice and soliton theory. M.Toda. *IEEE Trans. Circuits & Syst. (USA)*, vol.CAS-30, no.8, p.542-54 (Aug. 1983). Since the notion of stable pulses, known as solitons, plays a central role in the phenomena of wave propagation in nonlinear systems, an exposition of this topic is developed in some detail. It is known that the equations of motion of the one-dimensional lattice of particles with exponential interaction are integrable, namely, they admit exact solutions, and this system is equivalent to an LC circuit with certain nonlinear capacitance. In addition, a closely related partial differential equation called the Korteweg-de Vries (KdV) equation is also integrable. Special emphasis is placed on these integrable systems. (27 refs.)

111455 On the method for solving the complex sine-Gordon equation. Hang Nian-Ning (Istituto Nazionale di Fisica Nucleare, Torino, Italy). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.2, p.60-4 (10 Sept. 1983). A general form of the Lax pair equation is found to be reduced to the Zakharov and Sabat (ZS) form by using a similarity transformation whose existence is guaranteed by the compatibility conditions. Through the ZS solutions, two solutions of the complex Sine-Gordon equation in the one soliton case corresponding to different initial conditions, are easily found. (3 refs.)

- 111456 Hybrid mode technique yields waveguide dispersion analysis.** A.M.Pavio (Texas Instruments Inc., Dallas, TX, USA). *MSN Microwave Syst. News (USA)*, vol.13, no.4, p.106-11 (April 1983). Describes a numerical solution method which allows the evaluation of planar circuit structures for monolithic circuit applications. The dispersion characteristics of a coplanar waveguide in the direct presence of a ground plane surface is investigated using a full-wave analysis technique. Classical electromagnetic theory, applied to the illustrated boundary value problem, forms the basis of the solution method. This application of Galerkin's method in the Fourier-transform domain is commonly referred to as spectral domain analysis. A frequency dependent hybrid-mode analysis in the space domain generates a set of coupled integral equations which are transformed to a coupled set of algebraic equations. An accurate determination of the propagation constant is obtained by solving the eigenvalue equation of a low-order matrix equation. (6 refs.)
- 111457 Admissibility criteria for shock wave solutions of a system of conservation laws of mixed type.** M.Shearer (Dept. of Math., Duke Univ., Durham, NC, USA). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.93, pt.3-4, p.233-44 (1983). The following system of conservation laws is considered: $u_t - v_x = 0$, $v_t - \sigma(u)_x = 0$ where $\sigma: \mathbb{R} \rightarrow \mathbb{R}$ is a smooth function monotonically increasing except in an interval. Two criteria for the admissibility of shocks are shown to be independent in the sense that there are shocks satisfying each and violating the other. This contrasts with the corresponding situation for strictly hyperbolic systems ($\sigma'(u) > 0$ for all u), for which the two criteria are equivalent. (6 refs.)
- 111458 Almost-periodic forcing for a wave equation with a nonlinear, local damping term.** A.Haraux (Univ. Pierre et Marie Curie, Paris, France). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.94, pt.3-4, p.195-212 (1983). (27 refs.)
- 111459 On a Dirichlet-Neumann-Third mixed boundary value problem for the Helmholtz equation.** M.David (Sci. Dept., Min. of Defense, Tel Aviv, Israel). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.94, pt.3-4, p.221-33 (1983). Existence and uniqueness theorems are proved for the solution of a Dirichlet-Neumann-Third mixed boundary value problem for the Helmholtz equation in \mathbb{R}_3 . The proofs make use of an equivalent system of two integral equations of the second kind. (5 refs.)
- 111460 Singular filaments organize chemical waves in three dimensions. I. Geometrically simple waves.** A.T.Winfree, S.H.Strogatz (Dept. of Biological Sci., Purdue Univ., West Lafayette, IN, USA). *Physica D (Netherlands)*, vol.8D, no.1-2, p.35-49 (July 1983). This is the first of a series of papers on the anatomy of three-dimensional dissipative structures in excitable media. The Belousov-Zhabotinsky reagent provides examples. The authors describe the propagation of chemical waves in such media first in terms of 'phase' in a cycle of excitation and relaxation, then in terms of chemical concentration surfaces. Phase singularities are shown to arise in a natural way as ring-like filaments in three dimensions. They describe the known methods of creating singularities and the simplest wave structure organized by a singular filament: the experimentally demonstrated scroll ring. (30 refs.)
- 111461 Nonsteady waves in distributed dynamical systems.** B.A.Malomed (Inst. of Biological Phys., Acad. of Sci., Moscow, USSR). *Physica D (Netherlands)*, vol.8D, no.3, p.353-9 (Sept. 1983). The author studies one-dimensional and two-dimensional transient wave regimes in nonlinear systems of the reaction-diffusion type. In a one-dimensional case the process of collision of two travelling waves is considered. It is demonstrated that in the case of a nondispersive nonlinear system, where a steady regime of the collision is not possible, the process can be described by means of an approximation which is nonuniform in a spatial coordinate. The collision results, in a general case, in formation of an oscillatory shock moving with varying velocity. In a two-dimensional situation the transition of a rotating vortex into a rotating spiral wave in the case of dispersive systems and the inverse transition in the case of nondispersive systems are considered. (15 refs.)
- 111462 Scattering and nonscattering obstacles.** V.Twersky (Math. Dept., Univ. of Illinois, Chicago, IL, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.711-25 (Aug. 1983). Two problems of Helmholtz's equation for a wave incident on an obstacle are considered. For the first, the scattering problem, the obstacle's response satisfies Sommerfeld's outgoing wave radiation condition, and the net radiative response is positive; for the second, the response satisfies a standing wave condition (an appropriate combination of outgoing and incoming waves) such that the net radiative response is zero. The essential features of the solutions are exhibited in terms of amplitude functions g (the usual scattering amplitude) and g' , and the interrelation of the functions are stressed in the derivation of integral equations $g[g']$ (introduced earlier in multiple scattering contexts). The scattering amplitude g is always complex, but the simpler function g' is shown to be imaginary for nonabsorbing obstacles having inversion symmetry. Long-wavelength approximations for g' may be obtained from potential theory and perturbation procedures, and corresponding approximations for g then follow from $g[g']$. (12 refs.)
- 111463 Low frequency scattering by local inhomogeneities.** G.A.Kriegsmann, E.L.Reiss (Dept. of Engng. Sci. & Appl. Math., Northwestern Univ., Evanston, IL, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.923-34 (Aug. 1983). An asymptotic expansion which is uniformly valid space is obtained for the low frequency scattering of a plane wave incident on a localized inhomogeneity. The scattering region, which may be simply of multiply (collection of scatterers) connected, has a characteristic length which is small compared with the wave length of the incident wave. The index of refraction n is unity outside the scattering region and it is arbitrary inside the region. The method of matched asymptotic expansions is used in the analysis. The Born approximation is shown to agree with the uniform expansion in the far and the near fields. The leading term in the uniform expansion is a linear functional of $1-n^2$. Thus, statistics of the scattered field are easily evaluated from the statistics of n , when n is a random process. The method is then applied to the low frequency of an acoustic plane wave by localized inhomogeneities in the density and the index of refraction. Finally, the scattering by a plane which is acoustically hard except for a small impedance spot, is analyzed by the same method. (15 refs.)
- 111464 Equipartition of energy in scattering theory.** G.Dassios (Dept. of Math., Univ. of Patras, Patras, Greece), M.Grillakis. *SIAM J. Math. Anal. (USA)*, vol.14, no.5, p.915-24 (Sept. 1983). It is shown that the difference between the kinetic and the potential energy of a solution of the wave equation in the exterior of a star-shaped body, which vanishes on the surface of the body and has Cauchy data with compact support, decays to zero as time tends to infinity. Therefore asymptotic equi-

partition of energy occurs even in the presence of a scatterer. An upper bound for the rate of decay has been found. An extension of Morawetz's local energy decay result (1961) for the case of an expanding sphere is also obtained. (11 refs.)

03.50 CLASSICAL FIELD THEORY

- 111465 The classical electromagnetic field and the vacuum.** A.B.Datzeff (Dept. of Theoretical Phys., Univ. of Sofia, Sofia, Bulgaria). *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.239-55 (1983). An attempt to build up a microtheory of the electromagnetic field has been made on the basis of the hypothesis of a material field carrier. This carrier is called subvac and has a discrete structure. Without the use of the formal method with a test body to introduce the basic notions of the field (E, H, ϕ, A, e, m), these notions are defined by the internal subvac's properties. These notions yield the known relations for the classical electromagnetic field, as well as the Maxwell equations. Some logical difficulties of the classical theory are thus removed. The problem of the structure of the elementary charge (the electron) which requires a non-linear generalization of the Maxwell equations admittedly remains open. (9 refs.)
- 111466 The conserved currents for the Maxwellian field.** R.Arens (Dept. of Maths., Univ. of California, Los Angeles, CA, USA). *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.527-44 (1983). The author classifies the conserved currents for the Maxwellian field. There are four families: (1) the classical currents derived using Noether's theorem from conformal invariance (2) certain Noetherian currents based on translations in field space, (3,4) two more kinds not equivalent to any Noetherian form. (7 refs.)
- 111467 Lagrangian dynamics of a classical spinning particle with dipole moments.** G.Cognola, R.Soldati, L.Vanzo, S.Zerbini (Dipartimento di Fisica, Univ. di Trento, Trento, Italy). *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.2, p.109-29 (11 Aug. 1983). A singular Lagrangian formulation for the motion of a spinning particle (Dirac-Pauli electron) with general dipole moments in the presence of external electromagnetic and gravitational fields is given. The Dixon-Souriau equations are derived. The Lagrangian gives the transversality condition as primary constraint and leads to a phase space of minimal dimension. The Lagrangian approach is then extended to include a torsion field and the equations of motion for the classical counterpart of the Dirac electron in such a field are obtained. They are in full agreement with those derived by some authors using semi-classical approximations of the Dirac equation. The necessity to consider a mass dipole moment for such a particle is stressed. The Hamiltonian formulation for a spinning particle with anomalous magnetic moment in a pure electromagnetic field is also treated. Finally, the possibility of including nonAbelian gauge fields is briefly outlined and the Wong equations for a spinning particle are obtained. (23 refs.)
- 111468 The original Ampere force and Biot-Savart and Lorentz forces.** P.T.Pappas (Dept. of Phys., Univ. of Athens, Athens, Greece). *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.2, p.189-97 (11 Aug. 1983). The author presents the results of a very simple experiment, which favours the original Ampere force and unambiguously disproves the Biot-Savart force of relativity, or its approximation in a covariant relativistic form, namely the Lorentz force. This experiment with its extra degree of freedom has the advantage over the many other similar ones, including Ampere's original experiment, which have been performed in the past and recently by Graneau (1982), of giving results which are both qualitative and quantitative, as well as unambiguous. Due to the strong association of the Biot-Savart and Lorentz force to relativistic theories, the experiment can also be considered as limiting the generality of these theories. (33 refs.)
- 111469 Shortcut for constructing any Lagrangian from its equations of motion.** R.Hojman (Dept. de Física, Univ. de Santiago de Chile, Santiago, Chile), S.Hojman, J.Sheinbaum. *Phys. Rev. D (USA)*, vol.28, no.6, p.1333-6 (15 Sept. 1983). The authors show how to construct the Lagrangians for any regular mechanical system. The Lagrangians are a linear combination of the left-hand sides of their own equations of motion (up to a total derivative). The examples suggest that the same holds even for singular systems in field theory. (6 refs.)
- 111470 Classical and quantal supersymmetric Liouville theory.** E.D'Hoker (Dept. of Phys., MIT, Cambridge, MA, USA). *Phys. Rev. D (USA)*, vol.28, no.6, p.1346-57 (15 Sept. 1983). The classical supersymmetric Liouville theory is shown to be invariant under the supersymmetric extension of the conformal group. Lax pair and Backlund transformations are derived and the general classical solution is obtained. The isotropy group for every solution is constant on the solution manifold and equal to an $N=1$ conformal supersymmetry. For the quantum theory, the effective potential is computed exactly. The spectrum of the theory is continuous, bounded from below by zero, but no translationally invariant ground state exists. Translational invariance may be broken without the appearance of a Goldstone boson and a consistent perturbation theory in the coupling constant is obtained. The constant $N=1$ supersymmetry is also broken to a constant $N=1/2$ supersymmetry, and no Goldstone fermion arises. Space is

spontaneously reduced to the half-line. $N=1$ conformal supersymmetry remains exact to all orders of perturbation theory. (17 refs.)

111471 Null strings and null solutions of Maxwell's equations. K.Nagatomo (Dept. of Math., Osaka Univ., Osaka, Japan). *Proc. Jpn. Acad. Ser. A (Japan)*, vol.59, no.4, p.136-8 (April 1983). [received: Sept. 1983]

Establishes a relation between null strings and null solutions of Maxwell's equations (null electromagnetic fields). The author expresses Plucker's coordinates of the 2-dimensional surface swept out by a null string by means of a null electromagnetic field. (5 refs.)

Some novel delta-function identities See Entry 111355

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

111472 Elliptical orbits in quantum mechanics. D.R.Snider (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA). *Am. J. Phys. (USA)*, vol.51, no.9, p.801-3 (Sept. 1983).

Solutions are found to Schrodinger's equation with an inverse- r potential which well approximate the classical solution, an elliptical orbit. (2 refs.)

111473 Nonlinearly coupled oscillators: dynamics and statistical mechanics. Ta-You Wu (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.1-9 (Dec. 1982). [received: Sept. 1983]

In connection with the principle of equipartition of energy, the distinction between strict dynamics and statistical theory is illustrated by an example of two oscillators coupled by anharmonic potentials. Instead of solving an initial value problem in dynamics (such as in the work of Fermi-Pasta-Ulam), an element of randomness is introduced by the use of two independent time scales, a fast time for the oscillations and a slow time for the energy transfer due to the non-linear coupling. The non-linear equations of motions have been solved by numerical integration. The result is that an initial state of excitation does not recur as in Fermi-Pasta-Ulam's work, but approaches asymptotically (logarithmically) a redistributed state. (4 refs.)

111474 One-electron relativistic molecules with Coulomb interaction. I.Daubechies, E.H.Lieb (Dept. of Maths. & Phys., Princeton Univ., Princeton, NJ, USA).

Commun. Math. Phys. (Germany), vol.90, no.4, p.497-510 (1983).

As an approximation to a relativistic one-electron molecule, the authors study the operator $H = (-\Delta + m^2)^{1/2} - e^2 \sum_{j=1}^N |Z_j| x = R_j|^{-1}$ with $Z_j \geq 0$, $e^2 = 137.04$. H is bounded below if and only if $e^2 Z_j \leq 2/\pi$, all j . Assuming this condition, the system is unstable when $e^2 Z_j > 2/\pi$ in the sense that $E_0 = \inf \text{spec}(H) \rightarrow -\infty$ as the $R_j \rightarrow 0$, all j . They prove that the nuclear Coulomb repulsion more than restores stability; namely $E_0 + 0.069e^2 \sum_{j=1}^N Z_j |R_j - R_i|^{-1} \geq 0$. They also show that E_0 is an increasing function of the inter-nuclear distances $|R_i - R_j|$. (14 refs.)

111475 A new approach to the determination of good action-angle variables for coupled oscillator systems. L.C.Geiger, G.C.Schatz (Dept. of Chem., Northwestern Univ., Evanston, IL, USA).

Chem. Phys. (Netherlands), vol.79, no.3, p.431-47 (15 Sept. 1983).

A theory of action-angle variables for coupled oscillator systems is developed which involves solving the Schrodinger equation using a basis of WKB eigenfunctions, then using the logarithm of the resulting wavefunction to define the generator for the canonical transformation which determines the action-angle variables. This theory is based on the marriage between Miller's method for solving the Hamilton-Jacobi equation using the logarithm of the generating function, and the Ratner-Buch-Gerber method for solving the Schrodinger equation using WKB basis functions. A perturbation-theory analysis of this theory indicates that the semiclassical eigenvalues and canonical transformations obtained from it should become identical to their exact classical counterparts in the limit of large actions for each vibrational mode. Two methods for systematically improving the theory for the lower eigenstates are also proposed. Numerical applications of the theory are presented for two systems, the Morse oscillator and the Henon-Heiles two-mode hamiltonian. (24 refs.)

111476 Constraints on boundary conditions for enclosed systems due to real energy eigenvalues. R.J.Swenson (Phys. Dept., Montana State Univ., Bozeman, MT, USA).

Int. J. Quantum Chem. (USA), vol.24, no.3, p.333-4 (Sept. 1983).

The quantum mechanics of enclosed systems is of considerable interest. The consequences of various boundary conditions (BC) on the wave function have been treated recently (1981). The author discusses constraints on the types of BC which are imposed by requiring that the energy eigenvalues be real. (2 refs.)

111477 Bound-state energies for the superposed screened Coulomb potential. A.P.Kajwadkar, L.K.Sharma (Dept. of Appl. Phys. Government Engng. Coll., Jabalpur, India).

Indian J. Phys. Part B, vol.57B, no.3, p.209-14 (June 1983).

The bound-state eigenenergies for all angular momenta for the superposition of two static screened Coulomb potentials (SSCP) having different coupling constants and screening parameters have been evaluated by approximating it to the Eckart potential. The eigenenergy values for the single SSCP are found to have been enhanced considerably due to this superposition. (15 refs.)

111478 A new uniform semiclassical wave function for single surface and multisurface scattering. M.F.Herman (Dept. of Chem., Tulane Univ., New Orleans, LA, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2771-8 (15 Sept. 1983).

A procedure for the evaluation of one-dimensional uniform semiclassical wave functions is explored. This form of the approximate wave function is tested for the case of an exponential potential and is compared to the exact quantum mechanical and WKB wave functions. It is found that the uniform approximation provides a very accurate representation of the exact wave function, even at the turning points of the classical motion, where the WKB approximation diverges. It is demonstrated how correction terms can be constructed, leading to a formal expansion for the exact wave function. The individual terms of this expansion each involve a finite number of reflection points with uniform semiclassical propagation between these reflections. The analysis is extended to multisurface (nonadiabatic) problems, removing the turning point singularities which are generally present in semiclassical formulations of nonadiabatic problems. (15 refs.)

111479 A comparison of some lower bounds for eigenvalues of Schrodinger's equation. P.G.Hornby, M.N.Barber (Dept. of Appl. Math., Univ. of New South Wales, Kensington, NSW, Australia).

J. Phys. A (GB), vol.16, no.14, p.3291-311 (1 Oct. 1983).

A method proposed recently by Singh (1981) of finding lower bounds to the eigen-energies of Schrodinger's equation is reviewed and compared with the methods of Bazley and Fox (1961) and of Lowdin (1965). Numerical results for an anharmonic oscillator suggest that the Singh method is less accurate than the others, but unlike the Lowdin single bracketing function technique does not suffer from any eigenvalue ordering problems. (22 refs.)

111480 The recursion method of a linear operator inversion. M.Znojil (Inst. of Nuclear Phys., Czechoslovak Acad. of Sci., Rez, Czechoslovakia).

J. Phys. A (GB), vol.16, no.14, p.3313-23 (1 Oct. 1983).

For pt.II see *ibid.*, vol.11, p.1501 (1978). Suggests constructing an inverse of the infinite-dimensional matrix Q by means of its recurrent algebraic decomposition into the easily invertible two-diagonal factors. The merits and feasibility of the method are illustrated on the five-diagonal matrices. Quartic and decadic-decadic anharmonic propagators are chosen as examples of the application. (13 refs.)

111481 Quantum tunneling with dissipation. A.I.Larkin, Yu.N.Ovchinnikov (L.D. Landau Inst. of Theoretical Phys., Acad. of Sci., USSR). *JETP Lett. (USA)*, vol.37, no.7, p.382-5 (5 April 1983). Translation of: *Pis'ma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.322-5 (5 April 1983). [received: Oct. 1983]

Dissipative processes reduce the probability for quantum tunneling. The temperature dependence of the probability for the decay of a metastable state is analyzed. (5 refs.)

111482 On the law of composition of probabilities. E.Eberle (Istituto Dipartimentale di Fisica, Univ. di Catania, Catania, Italy).

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.1, p.24-6 (3 Sept. 1983).

A general formula for the composition of probabilities is derived, by means of few general assumptions, which is an evident generalization of the quantum formula. (5 refs.)

111483 Magnetic-field effects on the polarization correlation of photon couples emitted in an atomic cascade. F.Falciglia (Istituto di Fisica, Univ. di Catania, Catania, Italy), A.Garuccio, G.Iaci, L.Pappalardo.

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.2, p.52-4 (10 Sept. 1983).

A modification of the experiments for verifying the Einstein locality is proposed. It is possible to study the effects of an external magnetic field on the polarization correlation function of photon couples emitted in an atomic cascade of calcium. (4 refs.)

111484 The Aharonov-Bohm effect: how the switching-on procedure helps to understand it better. P.Frolov, V.D.Skarzhinsky (P.N. Lebedev Phys. Inst., Moscow, USSR).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.1, p.35-46 (11 July 1983).

The procedure of switching on the magnetic field in a solenoid is considered in order to investigate its influence on quantum states of an electron for a wave packet scattering and for a finite motion. It allows one to separate the classical action of the induced electric field on the electron from a pure quantum-mechanical effect connected with the appearance of a vector potential (Aharonov-Bohm effect). (10 refs.)

111485 Minimal constraints for a joint-probability distribution associated to microsystems. D.Evrard (Lab. de Mecanique Quantique, UER Sci., Reims, France).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.2, p.139-52 (11 Aug. 1983).

A general continuity equation in the (\mathbf{q}, \mathbf{p}) -space is stated for virtual flows from Liouville's complete theorem, i.e. not reduced to a Hamiltonian form. The comparison with the Schrodinger equation permits one to disclose the minimal imposed by this equation upon a joint-probability distribution function $P(\mathbf{q}, \mathbf{p}, t)$ associated to a microsystem. (11 refs.)

111486 On the occurrence of multiple spectra of eigenvalues in the one-dimensional complex scaled Schrodinger equation. O.Atabek, R.Lefebvre (Lab. de Photophys. Moleculaire, CNRS, Univ. de Paris-Sud., Orsay, France).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.2, p.176-88 (11 Aug. 1983).

Numerical experiments performed on the complex scaled one-dimensional radial Schrodinger equation with an exponential wall show that different rotation angles may produce different spectra. An explanation is given from a study of the analytic solutions and the relation with the Stokes phenomenon is pointed out. However, the spectra predicted by this analysis are not always obtained numerically. This is shown to be due to a self-correction effect which erases the memory of the boundary conditions. (18 refs.)

111487 Topology of two-dimensional autowaves. G.T.Gurija, M.A.Livshits (Inst. of Molecular Biology, Acad. of Sci., Moscow, USSR).

Phys. Lett. A (Netherlands), vol.97A, no.5, p.175-7 (29 Aug. 1983).

A two-dimensional waves classification based on the topology of the wave-vector distribution is suggested. The conservation laws for two topological quantum numbers impose restrictions on the possible wave transformations. The predictions are in full agreement with observations. (5 refs.)

111488 Moment method and the Schrodinger equation in the large N limit. J.P.Ader (Lab. de Phys. Theorique, Bordeaux, France).

Phys. Lett. A (Netherlands), vol.97A, no.5, p.178-82 (29 Aug. 1983).

A new technique is presented for solving the Schrodinger equation in the framework of the $1/N$ expansion. Based on recursion relations satisfied by moments of the coordinate operator, this method which allows to compute energy levels and wavefunctions is applied to four examples: the harmonic oscillator, the rotating harmonic oscillator, a linear plus Coulomb potential and a logarithmic one. (9 refs.)

111489 On the existence of bound states of N -particle systems in one and two dimensions. F.A.B.Coutinho, C.P.Malta, J.Fernando Perez (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.242-4 (5 Sept. 1983).

The authors give sufficient conditions for the existence, in one and two dimensions, of bound states of a system of N -particles interacting via two-body potentials. (7 refs.)

111490 Time-dependent superposition of spinors. G.Badurek, H.Rauch, J.Summhammer (Atominst., Osterreichischen Univ., Wien, Austria).

Phys. Rev. Lett. (USA), vol.51, no.12, p.1015-18 (19 Sept. 1983).

Inverting the spin state of one of the two coherent waves propagating within a neutron interferometer by means of a radio-frequency spin-flip device leads to a nonstationary interference pattern. By using stroboscopic neutron detection one can resolve this to demonstrate the nonclassical behavior of spinor superposition. (11 refs.)

111491 Comment on 'Direct measurement of the longitudinal coherence length of a thermal neutron beam' [and reply]. G.Comsa (Inst. für Grenzflächenforschung und Vakuumphys., KFA Jülich GmbH, Jülich, Germany), H.Kaiser, S.A.Werner, E.A.George. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1105-6 (19 Sept. 1983). In a recent letter, Kaiser, Werner and George (KWG) (*ibid.*, vol.50, p.560, 1983) present a beautiful neutron interference experiment and claim to have observed 'the detailed longitudinal shape of a neutron wave packet'. It is shown here that the KWG experiment only confirmed the already known value of the incident-beam wave-number spread, σ_n , but did not supply any new information, i.e. it was simply an alternative way to measure the wave-number spread. KWG then reply to this. (5 refs.)

111492 Quantum tunneling in multidimensional systems. S.Y.Lee, N.Takigawa (Inst. Phys., Acad. Sinica, Taipei, Taiwan). *Phys. Rev. C (USA)*, vol.28, no.3, p.1123-35 (Sept. 1983). The effects of coupling to a harmonic oscillator on the quantum tunneling of a macroscopic motion are studied through the influence functional formalism of Feynman's path integral method for the general coupling form factor. As an example, the authors consider the model in which the potential barrier is parabolic and the coupling Hamiltonian is linear in both coordinates of the macroscopic motion and of the intrinsic harmonic oscillator. The results are then compared with the exact solution obtained through the canonical transformation into normal coordinates in the limiting cases when the normal coordinates reduce to the original coordinates. They found that: (1) In the adiabatic case, i.e. when the recurrence time π/ω of the oscillator is much shorter than the transmission time through the macroscopic potential barrier, the effect of oscillator coupling can be well represented by an effective potential. The coupling enhances the tunneling probability on the whole. (2) There exists a critical energy, above which the tunneling probability is reduced because of the linear oscillator coupling. In the weak coupling limit and when $\omega \rightarrow 0$, the critical energy becomes $-\infty$, so that the coupling to the oscillator always reduces the tunneling probability. (20 refs.)

111493 Absence of singular continuous spectrum for two-body Schrödinger operators with long-range potentials (a new proof). H.L.Cycon (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA). *Proc. R. Soc. Edinburgh Sect. A (GB)*, vol.94, pt.1-2, p.61-9 (1983). The author proves the absence of singular continuous spectra for Schrödinger operators $-\Delta + V$ with long-range potential V such that V and $(1+r)^{1+\epsilon}(\partial/\partial r)V$ is $(-\Delta)$ -compact by using a modified 'Mourre type' estimate and by Kato-Lavine's H -smoothness theory. (14 refs.)

111494 Stochastic behavior in quantum scattering. M.C.Gutzwiller (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.341-55 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982). A 2-dimensional smooth orientable, but not compact space of constant negative curvature with the topology of a torus is investigated. It contains an open end, i.e. an exceptional point at infinite distance, through which a particle or a wave can enter or leave, as in the exponential horn of certain antennas or loudspeakers. In the Poincaré model of hyperbolic geometry the solutions of Schrödinger's equation for the reflection of a particle which enters through the horn are easily constructed. The scattering phase shift as a function of the momentum is essentially given by the phase angle of Riemann's zeta function on the imaginary axis, at a distance of $1/2$ from the famous critical line. This phase shift shows all the features of chaos namely the ability to mimic any given smooth function, and great difficulty in its effective numerical computation. A plot shows the close connection with the zeros of Riemann's zeta function for low values of the momentum (quantum regime) which gets lost only at exceedingly large momenta (classical regime?) Some generalizations of this approach to chaos are mentioned. (14 refs.)

111495 Quantum-classical correspondence for the Fourier spectrum of a trajectory. E.J.Heller (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.356-61 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982). Using a displaced localized wavepacket (coherent state) as a quantum analog to a classical trajectory, the author examines the Fourier spectrum of the expectation value of position X_t^Q and compare it with the classical Fourier spectrum of position X_t . In both the quasiperiodic and chaotic regimes, a strong classical-quantum correspondence exists in the Fourier spectrum. However, the quantum spectrum has certain interesting features not present in the classical case. (4 refs.)

111496 Intensity moments of semiclassical wavefunctions. M.V.Berry, J.H.Hannay, A.M.Ozorio de Almeida (H.H. Wills Phys. Lab., Bristol, England). *Physica D (Netherlands)*, vol.8D, no.1-2, p.229-42 (July 1983). For normalized wavefunctions $\psi(q)$ of N coordinates q , the authors obtain semiclassical approximations to the moments $I_m = \int dq |\psi(q)|^{2m}$, as a measure of the intensity variations of ψ . If ψ is a regular state, associated with an N -dimensional phase-space torus T , I_m diverges as $\hbar \rightarrow 0$ because of strong and rapidly-varying intensities at caustic singularities C , as follows: if C is a fold catastrophe, $I_m \sim F_m/\hbar^{(m-2)/3}$ if $m \geq 3$ and $I_2 \sim F_2 \ln(B/\hbar)$; if C is a cusp point, $I_m \sim C_m/\hbar^{(3m/2-1/4)}$; if C is a hyperbolic umbilic 'corner' point, $I_m \sim H_m/\hbar^{(2m-2)/3}$ if $m \geq 3$ and $I_2 \sim H_2 [\ln(B/\hbar)]^2$, the constants F_m , C_m and H_m are evaluated explicitly in terms of diffraction catastrophe integrals and the geometry of T . If ψ is a chaotic state, associated with a phase-space region of dimensionality $> N$ (e.g. the energy surface of an ergodic system), $I_m \sim \text{constant}$ as $\hbar \rightarrow 0$ because the (moderate) intensity fluctuations arise not from caustics but from incoherent interference of many de Broglie waves. (19 refs.)

111497 The calculations of an inverse potential problem. C.S.Morawetz (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA), G.A.Kriegsmann. *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.844-54 (Aug. 1983). A method is developed for solving an inverse problem for the wave equations with potential where the object is to find the potential given Cauchy data on a time-like surface. The computation is carried out with one space variable by an iterative procedure. The point of this method is that it can be extended to higher dimensions in principle. A coarse mesh finite difference scheme is used which yields fair accuracy. (8 refs.)

111498 Conservative difference scheme for generalized nonlinear Schrödinger equations. Chang Qianshun (Inst. of Appl. Math., Acad. Sinica, Beijing, China). *Sci. Sin. (China)*, vol.26, no.7, p.687-701 (July 1983). The conservative difference schemes for two mixed initial-boundary value problems of generalized nonlinear Schrödinger equations are considered. Using the Sobolev inequality for the difference operator, Gronwall's inequality, and the imbedded theorem, the author makes prior estimates of the difference solution and proves the stability and convergence of the difference

schemes. The difference schemes belong to transcendental equations. In order to solve it, computation formulae for the catch-ran iterative method are presented and the iterative convergence is proved. (6 refs.)

111499 Application of inverse scattering method to singular solutions of nonlinear equations. II. V.A.Arkad'ev, A.K.Pogrebkov, M.K.Polivanov (V.A. Steklov Math. Inst., Acad. of Sci., USSR). *Theor. & Math. Phys. (USA)*, vol.54, no.1, p.12-22 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.23-37 (Jan. 1983). [received: Sept. 1983] For pt.1, see *ibid.* vol. 53, p.163, (1982). The inverse scattering method is generalized to the case of the Zakharov-Shabat system with singular potentials. (6 refs.)

111500 Lectures on the inverse scattering method. V.E.Zakharov. Report KFKI-1983-71, Hungarian Acad. Sci., Budapest (1983), 58 pp. In a series of six lectures an elementary introduction to the theory of inverse scattering is given. The first four lectures contain a detailed theory of solitons in the framework of the KdV equation, together with the inverse scattering theory of the one-dimensional Schrödinger equation. In the fifth lecture the dressing method is described, while the sixth lecture gives a brief review of the equations soluble by the inverse scattering method.

03.70 THEORY OF QUANTIZED FIELDS

(see also 11.10 Field theory)

111501 New quantum treatment of Liouville field theory. J.-L.Gervais, A.Neuve (Lab. de Phys. Théorique, Ecole Normale Supérieure, Paris, France). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.329-48 (12 Sept. 1983). The authors exhibit a new treatment of the quantum Liouville theory in a box. In this treatment, the central charge of the Virasoro algebra is finite at the critical dimension of the associated string model and show how to reconstruct conformally covariant quantum field operators, in terms of a set of equally spaced harmonic oscillators. (7 refs.)

111502 Self-adjointness of the Fourier expansion of quantized interaction field Lagrangians. S.M.Paneitz, I.E.Segal (Dept. of Math., MIT, Cambridge, MA, USA). *Proc. Natl. Acad. Sci. USA*, vol.80, no.14, p.4595-8 (July 1983). Regularity properties significantly stronger than were previously known are developed for four-dimensional nonlinear conformally invariant quantized fields. The Fourier coefficients of the interaction Lagrangian in the interaction representation—i.e. evaluated after substitution of the associated quantized free field—is a densely defined operator on the associated free field Hilbert space K . These Fourier coefficients are with respect to a natural basis in the universal cosmos M , to which such fields canonically and maximally extend from Minkowski space-time M_0 , which is covariantly a submanifold of M . However, conformally invariant free fields over M_0 and M are identifiable. The k th Fourier coefficient of the interaction Lagrangian has domain inclusive of all vectors in K to which arbitrary powers of the free hamiltonian in M are applicable. Its adjoint in the rigorous Hilbert space sense is a_{-k} in the case of a hermitian Lagrangian. In particular ($k=0$) the leading term in the perturbative expansion of the S -matrix for a conformally invariant quantized field in M_0 is a self-adjoint operator. Thus, for example, if $\phi(x)$ denotes the free massless neutral scalar field in M_0 , then $\int_{M_0} \phi(x)^4 dx$ is a self-adjoint operator. No coupling constant renormalization is involved here. (15 refs.)

Classical and quantal supersymmetric Liouville theory See Entry 111470

03.80 GENERAL THEORY OF SCATTERING

(see also 11.20 S-matrix theory, and 11.80 Relativistic scattering)

111503 Recovery of spherically symmetric density distribution from a small-angle scattering curve. D.I.Svergun, L.A.Feigin, B.M.Shchedrin (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.147-50 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.252-9 (March-April 1983). [received: Sept. 1983] The authors discuss an algorithm for determining the signs of the scattering amplitudes of a system of identical spherically symmetrical particles of finite size. The method recovers the distribution of the scattered intensity from the particles without the need of any additional information. The authors discuss the application of the algorithm to the characteristic density distributions. They show that the method is stable against errors in determining the size of the particles, to cutoff of the scattering curve, and to deviations from spherical symmetry. (10 refs.)

Equipartition of energy in scattering theory See Entry 111464

04.00 RELATIVITY AND GRAVITATION

(for special relativity, see 03.30; for relativistic astrophysics, see 95.30; for relativistic cosmology, see 98.80)

04.20 GENERAL RELATIVITY

(see also 02.40 Geometry and topology)

111504 A critique of relativity and localization. E.T.Gendlin (Dept. of Behavioral Sci., Univ. of Chicago, Chicago, IL, USA), J.Lemke. *Math. Modelling (USA)*, vol.4, no.1, p.61-72 (1983).

A new philosophical model makes particles and information at single points derivative. Space-time grids are not events but only ideal comparisons made by observers. Therefore the identity of space-time points and also of single particles is inherently a speculative assumption. The conservation of units can be derived and is not a foundation for events. An interaction is an actual change and can determine changed particles and a changed space-time grid from itself, both forward and backward in time. In contrast, relativity theory still retains the classical unit model in which information is localized at single points, merely positing more than one observer. One implication of the new model is that quantummechanical solutions need not be limited by the requirements of relativity as is currently done. The model correctly predicts where difficulties should be found, and relates and explains many puzzles which are otherwise separated and inexplicable. (14 refs.)

111505 The positivity of gravitational energy and global supersymmetry. C.M.Hull (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

Commun. Math. Phys. (Germany), vol.90, no.4, p.545-61 (1983). The concept of gravitational energy and the proof of its positivity are reviewed. The relationship between Witten's proof of the positivity of mass and supergravity is explained with reference to the group of global supersymmetries of a spacetime. A formula for the mass is given, in terms of the change of the supercharge under global supersymmetry, which has a simple positivity theorem and which reduces to Witten's expression. An interpretation of Witten's constraint on the spinors used in his proof is given. (26 refs.)

111506 Finding space-time geometries without using a metric. A.Karlhede, U.Lindstrom (Inst. of Theoretical Phys., Univ. of Stockholm, Stockholm, Sweden).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.597-610 (July 1983). A new method for obtaining solutions to Einstein's field equations is presented. It is based on the description of a geometry in terms of the curvature tensor and a number of its covariant derivatives. These entities are used instead of the metric. Physical requirements, such as symmetries, are easily imposed in this picture. An example, including the Schwarzschild geometry, is discussed in detail, but no attempts to find new solutions are made. (10 refs.)

111507 Dual interpretation of electromagnetic fields in general relativity. A.K.Raychaudhuri, S.K.Saha (Dept. of Phys., Presidency Coll., Calcutta, India).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.611-23 (July 1983). An energy stress tensor satisfying Rainich's algebraic relations along with a specified metric tensor sometimes admits two alternative Maxwell fields—one with a nonvanishing current vector as source and the other without any source. The authors investigate the conditions for the existence of a source-free interpretation when a 'with source' solution with various types of the source current vector (i.e. timelike, null, or spacelike) is known and illustrate the results with some examples. It turns out that in the case of timelike currents a dual interpretation requires this to be a purely convection current, while in other cases a dual interpretation is possible only if the conductivity is infinite and the 'conduction' current is in the direction of the magnetic field. (12 refs.)

111508 Real structures in asymptotically flat \mathcal{U} spaces. N.Kamran (Dept. of Appl. Maths., Univ. of Waterloo, Waterloo, Ontario, Canada), E.T.Newman.

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.655-60 (July 1983). A real structure is defined in asymptotically flat \mathcal{U} spaces and investigated in connection with the equations of motion in \mathcal{U} space. (8 refs.)

111509 Curvature collineations for type-N Robinson-Trautman space-times. E.G.L.R.Vaz, C.D.Collinson (Dept. of Appl. Maths., Univ. of Hull, Hull, England).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.661-71 (July 1983). The metric of type-N Robinson-Trautman space-times (1962) is generated by a real function P satisfying certain field equations. Canonical forms for P are obtained under the assumption that at least one curvature collineation exists. In order to give an example of the improper subgroup structure of a group of curvature collineations all the curvature collineations are determined for the space-times corresponding to one of the two canonical forms. (12 refs.)

111510 On the global geometry of the Stephani universe. A.Krasinski (Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.673-89 (July 1983). A preliminary investigation of global properties of the Stephani solution (1967) of the Einstein field equations is presented. This solution generalizes those of Friedman-Robertson-Walker (FRW) in such a way that the spatial curvature index k (a constant in the FRW models) is a function of the time coordinate. The de Sitter solution, which is also a special case of the Stephani solution, is analyzed in the Stephani coordinates to gain insight into the global structure of the manifold and its foliation. The general metric is found to have several properties in common with this example. It has singularities which can be avoided either by matching the solution to an (as yet unknown) empty-space solution or confining the curvature index to be positive at all times. (17 refs.)

111511 Multipole moments for stationary systems: the equivalence of the Geroch-Hansen formulation and the Thorne formulation. Y.Gursel (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA).

Gen. Relativ. & Gravitation (USA), vol.15, no.8, p.737-54 (Aug. 1983). It is proved that the multipole moments of a stationary asymptotically flat system in general relativity theory as defined by Thorne (1980) are identical, aside from normalization, to those defined by Geroch (1970) and Hansen (1974). The mathematical techniques of Thorne are combined with those of Geroch and Hansen to prove several new theorems about multipole moments, and to give new proofs to some of the old theorems. (13 refs.)

111512 Exterior fields can have different sources—even empty ones. G.Lawitzky (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Astrophys., Garching bei Munchen, Germany).

Gen. Relativ. & Gravitation (USA), vol.15, no.8, p.755-9 (Aug. 1983). Using York's formulation (1971) of the constraint equation in general relativity, the author proves the existence of a pair of solutions on \mathbb{R}^3 which coincide outside a compact set and have finite ADM-mass, one with material sources, the other one purely gravitational. (9 refs.)

111513 A rotating mass embedded in an Einstein-Godel universe. M.D.Patel, P.C.Vaidya (Dept. of Math., Sardar Patel Univ., Vallabh Vidyanagar, India).

Gen. Relativ. & Gravitation (USA), vol.15, no.8, p.777-83 (Aug. 1983). A metric containing a parameter ϵ ($\epsilon^2=1$) has been obtained which represents a Kerr metric in the background of a static Einstein universe when ϵ is put equal to +1. The same metric will represent the external field of a mass embedded in a rotating Godel universe when ϵ is set equal to -1. (4 refs.)

111514 Non-Einsteinian gravitational Lagrangians assuring cosmological solutions without collapse. J.P.Duruisseau, R.Kerner (Dept. de Mécanique, Univ. Pierre et Marie Curie, Paris, France), P.Eysseric.

Gen. Relativ. & Gravitation (USA), vol.15, no.8, p.797-807 (Aug. 1983). The authors discuss a method of determining the form of the hypothetical gravitational Lagrangian $f(R)$ replacing the Einsteinian Lagrangian R in order to avoid the singularity in cosmological solutions. Instead of supposing some form of $f(R)$ as an unknown function while inserting the cosmological solution coinciding with Friedmann solution everywhere except for the singularity, which is replaced by a regular minimum of the scale factor $a(t)$ (a regular maximum of curvature). Then they find $f(R)$ by numerical integration. The Lagrangians thus obtained for different cases ($k=0, \pm 1$, and with the equation of state corresponding to pure radiation) have some common properties, among which $|f(R)| < |R|$ (concavity), and the absence of asymptotes. (11 refs.)

111515 An inequality relating total mass and the area of a trapped surface in general relativity. M.Ludvigsen (Dept. of Math., Univ. of Canterbury, Christchurch, New Zealand), J.A.G.Vickers.

J. Phys. A (GB), vol.16, no.14, p.3349-53 (1 Oct. 1983). Let M be a space-time which is asymptotically flat at past null infinity \mathcal{I}^- , satisfies the dominant energy condition and contains a trapped surface \mathcal{T} . The authors show that if \mathcal{T} can be connected to \mathcal{I}^- by means of a nonsingular null-hypersurface \mathcal{N} , then $m^2 \geq A/16\pi$ where m is the Bondi mass with respect to \mathcal{N} and A in the area of \mathcal{T} . (12 refs.)

111516 Canonical general relativity: the primary constraint algebra. J.M.Charpap, J.E.Nelson (Dept. of Phys., Queen Mary Coll., London, England).

J. Phys. A (GB), vol.16, no.14, p.3355-60 (1 Oct. 1983). Discusses the canonical treatment of general relativity in a vierbein formulation. The authors derive the primary constraints, and find that they satisfy an algebra the same as that of the generators of local Poincaré transformations, namely the Poincaré algebra. (5 refs.)

111517 Einstein equations as identities in the theory of direct gravitational interaction. A.Yu.Turygin (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.37, no.5, p.131-4 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.110-13 (1982). Specific form is given to the action and, correspondingly, the effective metric for a trial particle constructed in an earlier work. It is shown that this metric identically satisfies the Einstein equations at each step of the iteration. (4 refs.)

111518 Absorber theory for the Einstein equations in the first approximation. A.Yu.Turygin (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.101-4 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.84-7 (1983). The validity of absorber theory for the Einstein equations in the first approximation, within the framework of a static model of the Universe, is shown. (5 refs.)

111519 Einstein equation solutions related to the Weyl metric through Ehlers Method. R.Balbinot, R.Bergamini (Istituto di Radioastronomia, CNR, Bologna, Italy), B.Giorgini.

Nuovo Cimento B (Italy), vol.76B, ser.2, no.1, p.1-8 (11 July 1983). The Ehlers theorem is applied to produce internal solutions corresponding to a rigidly rotating pressureless body. (5 refs.)

111520 Covariant concept of gravitational energy. E.Gliner (Joint Inst. for Lab. Astrophys., NBS, Boulder, CO, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1278-84 (15 Sept. 1983). The covariant approach is proposed for the energy description of matter integrated with gravitation. The approach is based on the generalization of the special relativity stress-energy tensor up to the fourth tensor rank which introduces the anisotropies of mass, impulse, and their fluxes. The components describing anisotropies form an 'energy deviator' which is a traceless fourth-rank tensor corresponding to Weyl's part of gravitation. (6 refs.)

111521 Stationary vacuum fields with a conformally flat three-space III. The conformal condition. B.Lukacs, Z.Perjes, A.Sebestyen, G.A.J.Sparling.

Report KFKI-1983-31, Hungarian Acad. Sci., Budapest (1983), 6 pp. For pt.II see KFK preprint KFKI-1982-19 (1982). The general solution is obtained for the conformal equation of the three-space of a stationary vacuum space-time in general relativity. There are three classes of solutions, characterized by the parameter values $k=\pm 1$ and 0, respectively. All explicitly known conformastat space-times fall into the class with $k=+1$. (7 refs.)

04.30 GRAVITATIONAL WAVES AND RADIATION: THEORY

111522 Remote quantum mechanical detection of gravitational radiation. T.K.Leen, L.Parker, L.O.Pimentel (Dept. of Phys., Univ. of Wisconsin-Milwaukee, Milwaukee, WI, USA). *Gen. Relativ. & Gravitation (USA)*, vol.15, no.8, p.761-76 (Aug. 1983). The presumed existence of atomic hydrogen in the vicinity of sources of gravitational radiation suggests its use as a radiation detector. Curvature-induced atomic energy level shifts carry a unique signature and could thus provide from remote detection of gravitational radiation. The authors investigate the shifts induced by space-time curvature arising from gravitational waves. The effect is studied for both low-lying and highly excited states of atomic hydrogen. Numerical results are quoted for radiation from various sources, including binary star systems, binary neutron stars, binary black holes, collapsing stars and pulsars. In addition, they provide a theoretical upper limit to the magnitude of the effect. For completeness, they examine the shifts induced in a harmonic oscillator as well as a rigid rotator. (12 refs.)

Emission of relativistic particles in a strong gravitational field See Entry 111531

04.40 CONTINUOUS MEDIA; ELECTROMAGNETIC AND OTHER MIXED GRAVITATIONAL SYSTEMS

111523 Material and electromagnetic sources of the Kerr-Newman geometry. C.A.Lopez (Dept. de Fisica, Facultad de Ciencias Fisicas y Matematicas, Univ. de Chile, Santiago, Chile). *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.1, p.9-27 (11 July 1983). A method based on the theory of distributions, introduced by the author to analyse Kerr's singularity, is extended to the study of the Kerr-Newman geometry. In this case both the metric tensor and the electromagnetic potential are considered to be distributions defined all over space-time. The second partial derivatives of these quantities, when inserted into the coupled Einstein-Maxwell equations, give distributions with support on the singular ring and equatorial disk. It is verified that the material stress-energy tensor, as well as the electromagnetic-current vector, correctly reproduces the known asymptotic values of mass, charge and angular momentum of the collapsed object, provided due account is taken of the energy and angular momentum lying outside the source. Furthermore, a mapping of the electromagnetic field in the vicinity of the singularity is achieved by drawing the electric and magnetic lines of force. (7 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

111524 A bimetric Machian approach to gravitation. R.Goldoni (Dipartimento di Matematica, Univ. of Pisa, Pisa, Italy). *Gen. Relativ. & Gravitation (USA)*, vol.15, no.7, p.691-9 (July 1983). Proposes a bimetric Machian approach to gravitation with a mathematical structure much simpler than the one of Rosen's bimetric theories. The author obtains two cosmological models based on the simplest assumption that the Universe be filled of pure dust matter. One of the two cosmological models is compatible with the currently observed value of the density of dust matter, and provides an age of the Universe which is of the order of the inverse of the present Hubble parameter. One also obtains the Schwarzschild-like solution and its Newtonian limit together with the modified three Kepler laws which allows the author to find that presently $0.5\times 10^{-10} \text{ (yr)}^{-1} \delta(\dot{A}/A)\delta 0.625\times 10^{-10} \text{ (yr)}^{-1}$, a denoting the semimajor axis of the orbit of the test particle. Lastly the author obtains the Newtonian limit of the theory. (12 refs.)

111525 Topological maxima and the dynamics of an axial vector torsion field. W.Drechsler (Max-Planck-Inst. fur Phys. und Astrophys., Werner-Heisenberg-Inst. fur Phys., Munich, Germany). *Gen. Relativ. & Gravitation (USA)*, vol.15, no.8, p.703-23 (Aug. 1983). A generalized theory of gravitation is discussed which is based on a Riemann-Cartan space-time, U_4 , with an axial vector torsion field. Besides Einstein's equations determining the metric of the U_4 a system of nonlinear field equations is established coupling an axial vector source current to the axial vector torsion field. The properties of the solutions of these equations are discussed assuming a London-type condition relating the axial current and torsion field. To characterize the solutions use is made of the Euler and Pontrajagin forms and the associated quadratic curvature invariants for the U_4 space-time. It is found that there exists for a Riemann-Cartan space-time a relation between the zeros of the axial vector torsion field and the singularities of the Pontrajagin invariant, which is analogous to the well-known Hopf relation between the zeros of vector fields and the Euler characteristics. (13 refs.)

111526 Electric and magnetic monopole solutions free from singularities in the nonsymmetric unified field theory. Min-Guang Zhao (Phys. Dept., Sichuan Teachers' Coll., Chengdu, China). *J. Phys. A (GB)*, vol.16, no.14, p.3341-8 (1 Oct. 1983). By introducing a physically acceptable, supplementary condition for the field functions in unified field theory, the electric and magnetic monopole solutions free from singularities everywhere were deduced. This indicates that the divergence difficulties of a point particle can be removed by utilising a reasonable Boal-Moffat condition (1975). (12 refs.)

111527 Relativistic inert-mass tensor. G.Yu.Bogoslovskii (Sci. Res. Inst. of Nuclear Phys., Moscow, Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.81-3 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.70-1 (1983). Within the framework of the relativistic theory of anisotropic space-time, an explicit expression is found for the relativistic inert-mass tensor in terms of the field values determining the local spatial anisotropy and the isolated direc-

tion. In accordance with the initial idea of Dicke, the dependence of the inertia on the localization of the body and the direction in space is found to be universal, and identical for all bodies that are in identical states. (7 refs.)

111528 Chaotic inflation. A.D.Linde (Lebedev Phys. Inst., Moscow, USSR). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.177-81 (22 Sept. 1983). A new scenario of the very early stages of the evolution of the universe is suggested. According to this scenario, inflation is a natural (and may be even inevitable) consequence of chaotic initial conditions in the early universe. (15 refs.)

111529 Spontaneous compactification of $D=10$ Maxwell-Einstein theory leads to $SU(3)\times SU(2)\times U(1)$ gauge symmetry. S.Watamura (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.188-92 (22 Sept. 1983). Solutions of ten-dimensional Maxwell-Einstein theory and a bosonic part of $N=2$, $D=10$ supergravity theory are examined. It is shown that there is a solution for which six-dimensional internal space is compactified into $CP_2\times S_2$. The gauge symmetry of the effective four-dimensional theory is $SU(3)\times SU(2)\times U(1)$. The introduction of fermions is also considered. The requirement of consistency in introducing a spin^c structure on CP_2 results in a $U(1)$ charge quantization condition. (14 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

111530 Various aspects of the time-gauge in Poincare gauge theory. M.Bлагоjevic (Dept. of Theoretical Phys., Kidric Inst., Belgrade, Yugoslavia), I.A.Nikolic. *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.3, p.77-82 (17 Sept. 1983). The procedure for using the time gauge at an early stage of the Poincare gauge theory is precisely defined, and the equivalence with the standard Hamiltonian approach is shown. (6 refs.)

111531 Emission of relativistic particles in a strong gravitational field. A.A.Sokolov, A.N.Aliev, D.V.Gal'tsov (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.37, no.5, p.102-5 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.88-91 (1982). The local-coordinate method is used to investigate the synchrotron radiation of ultrarelativistic particles moving in a magnetic field in curved space-time. General covariant formulas are obtained for the radiation spectrum in the classical and quantum cases. It is shown that the radiation intensity and the relative values of the quantum corrections increase when the particle moves close to the event horizons in the Schwarzschild metric. The limiting transition to conditions of geodesic synchrotron radiation is considered. (4 refs.)

Einstein equations as identities in the theory of direct gravitational interaction See Entry 111517

04.65 SUPERGRAVITY

111532 Gravity with extra gauge symmetry. I.Bars, S.W.MacDowell (J.W. Gibbs Lab., Yale Univ., New Haven, CT, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.182-4 (22 Sept. 1983). In addition to the tangent space Lorentz gauge invariance, the authors introduce an extra gauge principle in the gauge formulation of gravity, in any dimension. The connection ω_{μ}^{ij} , which starts out as an elementary field, undergoes a gauge transformation which mixes tangent space indices (i,j) with base indices (μ). The equations of motion determine ω_{μ}^{ij} as the sum of usual riemannian connection and a completely antisymmetric torsion piece. In 11 dimensions the theory reproduces the bosonic sector of supergravity if they identify torsion with the 3-index potential $A_{\mu\nu\lambda}$. This generalizes Englert's recent observation, since the formulation torsion= $A_{\mu\nu\lambda}$ for any field configuration, not just a solution. (5 refs.)

111533 Inequivalence between gauged $O(8)$ supergravities. J.-P.Hurni, B.Morel (Dept. de Phys. Theorique, Univ. de Geneve, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.185-7 (22 Sept. 1983). The authors analyze the geometrical structure of the de Wit and Nicolai $SO(8)_{loc}\times SU(8)$ supergravity. They conclude that $SO(8)$ is non-linearly realized down to $SU(4)$. (7 refs.)

111534 How does anticommutator $\{Q_{\alpha}Q_{\beta}\}$ realize energy-momentum P_{μ} in quantum supergravity? Particular properties of global gauge transformation charges in gauge theories. T.Kugo, T.Kuramoto, S.Uehara (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *Z. Phys. C (Germany)*, vol.19, no.3, p.241-50 (1983). It is investigated to what extent the well-known algebra $\{Q^s, \bar{Q}^s\} = \gamma^{\mu} P_{\mu}$ in the rigid supersymmetry theory holds in quantum supergravity. The anticommutator $\{Q_{\alpha}^s, \bar{Q}_{\beta}^s\} \equiv (\gamma^{\mu})_{\alpha\beta} P_{\mu}$ defines an 'internal' translation generator P_{μ} , quite another from the 'external' translation generator P_{μ} . It is, however, shown that those two operators give the same matrix elements between any two physical states aside from a proportional factor. Such a 'miracle' is caused by some particular properties of global gauge transformation charge universal in gauge theories. These properties are fully clarified in a general manner. (12 refs.)

04.80 EXPERIMENTAL TESTS OF GENERAL RELATIVITY AND OBSERVATIONS OF GRAVITATIONAL RADIATION

111535 On calculation of magnetic-type gravitation and experiments. Peng Hui (Inst. of Appl. Math., Acad. Sinica, Beijing, China). *Gen. Relativ. & Gravitation (USA)*, vol.15, no.8, p.725-35 (Aug. 1983). The linearized Einstein equations are written in the same form as the Maxwell equation. In the case of a weak stationary field and low velocity, the geodesic equations are written in the form of the Lorentz equation of motion. The author suggests that the existence of the magnetic-type gravitation predicted by GR is equivalent to the existence of the gravitational wave predicted by GR. The Schiff effect is explained as one of the magnetic-type gravitation and the new effect is given. The Hall-type gravitational experiment is studied. (8 refs.)

111536 Matching of high-Q gravitational antenna with the resonator of a capacitive oscillation transducer. A.D.Kochubei, V.P.Mitrofanov (Dept. of Oscillation, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.84-6 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.72-4 (1983).

A capacitive oscillation transducer of parametric type with VHF pumping is used to measure the limiting small antenna oscillations in a gravitational-wave experiment. A matching scheme for a high-Q antenna and a transducer resonator that is stable to seismic perturbation is considered. (4 refs.)

111537 A proposed back action evading read-out for a gravitational wave detector. M.F.Bocko, L.Narici, D.H.Douglass, W.W.Johnson (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *Phys. Lett. A (Netherlands)*, vol.97A, no.6, p.259-62 (5 Sept. 1983).

The authors propose a Back Action Evasion read out to improve the sensitivity of a capacitively coupled resonant transducer for gravitational wave detectors. They show that the noise can be reduced by factors 10 to 100 over the standard amplifier limit using detector parameters already achieved. (9 refs.)

04.90 OTHER TOPICS IN RELATIVITY AND GRAVITATION

111538 On the significance of the axial Newtonian gravitational force of the finite cylinder. Chen Yingtian, Wang Qing (Huazhong Univ. of Sci. & Technol., Wuhan, China). *Sci. Sin. (China)*, vol.26, no.7, p.732-8 (July 1983).

The general expression of the axial Newtonian force of a right circular cylinder is given; the behaviour of the gravitational field of a hollow cylinder in the proximity of the stationary points is derived and discussed. (9 refs.)

05.00 STATISTICAL PHYSICS AND THERMODYNAMICS

(see also 02.50 Probability theory, stochastic processes, and statistics)

05.20 STATISTICAL MECHANICS

111539 Density functionals for Coulomb systems. E.H.Lieb (Dept. of Math. & Phys., Princeton Univ., Princeton, NJ, USA). *Int. J. Quantum Chem. (USA)*, vol.24, no.3, p.243-77 (Sept. 1983).

Discusses some of the mathematical connections between N -particle wave functions ψ and their single-particle densities $\rho(x)$. The author establishes some of the mathematical underpinnings of 'universal density functional' theory for the ground state energy as begun by Hohenberg and Kohn. He shows that the HK functional is not defined for all ρ and presents several ways around this difficulty. Since the functional mentioned is not computable, the author reviews examples of explicit functionals that have the virtue of yielding rigorous bounds to the energy. (30 refs.)

111540 Expansions of the kinetic hierarchy for a massive particle: the repeated ring and Fokker-Planck equations. J.Mercer, T.Keyes (Sterling Chem. Lab., Yale Univ., New Haven, CT, USA). *J. Stat. Phys. (USA)*, vol.32, no.1, p.35-51 (July 1983).

The tagged particle BBGKY hierarchy is systematically expanded in inverse powers of the square root of the particle mass. In the Brownian limit, for fixed Knudsen number, the hierarchy reduces to the Brownian limit of the repeated ring equation which itself reduces to the Fokker-Planck equation. The friction coefficient of the Fokker-Planck equation is found to be a functional of the solution of Dorfman, van Beijeren, and McClure's (1976) extended Boltzmann equation for a fixed object in a flowing gas. As a consequence, the tagged particle diffusion coefficient calculated in the Brownian limit of the repeated ring equation is valid for all particle sizes. (15 refs.)

111541 Comments on the Grad procedure for the Fokker-Planck equation. J.Meyer, J.Schroter (AG Theoretische Phys., Univ. Paderborn, Paderborn, Germany). *J. Stat. Phys. (USA)*, vol.32, no.1, p.53-69 (July 1983).

If the kinetic equation of a macroscopic system is expanded with respect to the velocity in terms of orthogonal functions, e.g. in terms of Hermite functions one obtains an infinite hierarchy of equations for the expansion coefficients. Grad's method consists in truncating this hierarchy and investigating the remaining finite system. The authors set up conditions under which this procedure is rigorously justified in case of the Fokker-Planck equation. (6 refs.)

111542 Equilibrium theory for the hard-core systems. S.Shinomoto (Dept. of Phys., Faculty of Sci., Tohoku Univ., Sendai, Japan). *J. Stat. Phys. (USA)*, vol.32, no.1, p.105-13 (July 1983).

It is found that the density expansion in the argument of the exponential function gives a fine convergence on the equation of state of the hard-sphere system. The pair distribution function and the equation of state is constructed by an intuitive kinetic theoretical method. The equation of state of the hard-core system with attractive potential is constructed semiempirically with the aid of this simple analytical result, and Kammerling-Onnes' constant of the critical point is obtained analytically. (10 refs.)

111543 Perturbation expansions in statistical physics. I.P.Bazarov, P.N.Nikolaev (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1021-2 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1344-5 (Dec. 1982). [received: Sept. 1983]

In the determination of the configurational free energy of a system of N identical particles interacting via central forces with interaction potential $\Phi(r)$, the free energy is defined as $F = -\theta \ln[Q/N]$, where Q is the configurational integral. In the case $N \gg 1$ the free energy is additive in the number of particles. Therefore, $F = F_0 + F_1$, where $F_0 = -\theta \ln[qe/N] + o(N)$, $q = Q^{1/N}$. Thus, the central task of the statistical theory of many particles is the determination of $q(\theta, v)$, where $\theta = kT$ and v is the volume per particle. This paper is devoted to solving this problem. (5 refs.)

111544 A statistical physics model. V.S.Vladimirov, I.V.Volovich (V.A. Steklov Math. Inst., Acad. of Sci., USSR). *Theor. & Math. Phys. (USA)*, vol.54, no.1, p.1-12 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.8-22 (Jan. 1983). [received: Sept. 1983]

A Gaussian model on a half-axis with interaction given by a Toeplitz form is considered. The free energy and correlation functions are calculated. A new method of inverting Toeplitz matrices and solving the generalized Wiener-Hopf problem is used. The asymptotic behaviour of the correlation functions is studied and the conditions for the presence or absence of long-range order are established. The free energy and correlation functions are calculated for a Gaussian model with external field. An expression is obtained for the free energy of a multidimensional Gaussian model. (29 refs.)

111545 On random fields corresponding to the BBGKY, Vlasov, and Boltzmann hierarchies. V.P.Maslov, A.M.Chebotaev (Moscow Inst. of Electronic Engng., Moscow, USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.48-55 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.78-88 (Jan. 1983). [received: Sept. 1983]

A correspondence is established between the creation and annihilation operators introduced by Maslov and Tariverdiev (1982) for the densities of the Bogolyubov and Boltzmann hierarchies and the transformations of the measures of the random fields associated with the hierarchies. Bogolyubov's equation (1962) in variational derivatives for the moment functional of the hierarchies is replaced by an equation for the characteristic functional, which is an infinite-dimensional Fourier transform of a measure. The measures of the random fields of the hierarchies satisfy infinite-dimensional analogs of the known equations. These equations are written down by means of creation and annihilation operators acting on functionals and measures. (15 refs.)

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

111546 An uncertainty principle for fermions with generalized kinetic energy. I.Daubechies (Phys. Dept., Princeton Univ., Princeton, NJ, USA). *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.511-20 (1983).

The author derives semiclassical upper bounds for the number of bound states and the sum of negative eigenvalues of the one-particle Hamiltonians $h = (-\nabla^2) + V(x)$, acting on $L^2(\mathbb{R}^N)$. These bounds are then used to derive a lower bound on the kinetic energy $\sum_{i=1}^N \langle \psi, f(-\nabla^2) \psi \rangle$ for an N -fermion wavefunction ψ . The author discusses two examples in more detail: $f(p) = |p|$ and $f(p) = (p^2 + m^2)^{1/2} - m$, both in three dimensions. (8 refs.)

111547 Towards a comprehensive semiclassical ergodic theory. K.G.Kay (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada). *J. Chem. Phys. (USA)*, vol.79, no.6, p.3026-50 (15 Sept. 1983).

The authors identify quantum dynamical conditions that tend, as $\hbar \rightarrow 0$, to the classical conditions of ergodicity, weak mixing, mixing, and absolutely continuous spectrum. They use these conditions to derive asymptotic properties of wave functions, matrix elements, and energy levels of systems with various ergodic properties in the classical limit. Some of these properties are new while others modify older predictions of 'quantum ergodic properties'. Thus, the present work serves to extend, unify, and refine a number of previous theories. One new prediction is that weak mixing leads to the Van Hove diagonal singularity condition for a certain class of operators. This result may have significant implications for the applicability of nonequilibrium statistical mechanics to finite systems. (54 refs.)

111548 Monte Carlo calculation of the radial distribution function of quantum hard spheres at finite temperatures using path integrals with boundary conditions. G.Jacucci (Dipartimento di Fisica, Univ. di Trento, Trento, Italy), E.Omert.

J. Chem. Phys. (USA), vol.79, no.6, p.3051-4 (15 Sept. 1983). The two body contribution to the radial distribution function of quantum hard spheres is calculated using the Monte Carlo method based on path integrals. Hard core boundary conditions are taken into account by means of an 'image' approximation obtaining accurate numerical results. (7 refs.)

111549 Fermionic lifting of variational self-adjointness. R.Trostel (Inst. fur Theoretische Phys., Tech. Univ. Berlin, Berlin, Germany). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.1, p.19-23 (3 Sept. 1983). Variational principles, Helmholtz's variational self-adjointness conditions and Santilli's method (1977, 1978, 1983) of the indirect analytic representation factors are extended to the case of dealing with fermionic systems described by Grassmann variables. (9 refs.)

111550 Comment on 'Monte Carlo evaluation of functional integrals using coherent-state Slater determinants' [and reply]. T.Troudet, S.E.Koonin (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA), Y.Avishai, J.Richert. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1103-4 (19 Sept. 1983).

In a recent letter, Avishai and Richert (ibid., vol.50, p.1175, 1983) proposed a Monte Carlo evaluation of many-fermion functional integrals using real coherent-state Slater determinants. Troudet and Koonin present briefly the results of their own investigations of this problem. First, they have obtained the computer code used in the calculations and have verified that they can reproduce the results presented there. However, further calculations with this code (such as changing the step in x used in the Metropolis algorithm) indicated that the original step size used was far too small, resulting in a sampling of Slater determinants only in a small neighborhood about the state

from which the random walk was initiated. Avishai and Richert then reply to this. (6 refs.)

111551 Green's functions in the Dicke model. I. Evolution equation. N.N.Bogolyubov, Jr., A.R.Kazaryan, A.M.Kurbatov, V.N.Neskoromnyi (V.A.Steklov Math. Inst., Acad. of Sci., USSR). *Theor. & Math. Phys. (USA)*, vol.54, no.1, p.93-7 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.147-53 (Jan. 1983). [received: Sept. 1983]

A system of two-level emitters interacting with a photon field in the 'rotating wave' approximation is investigated. For the Green's function of such a system an exact equation in which the variables of the photon field are eliminated is obtained. The self-consistent field approximation and the small value of the coupling constant are used to obtain a closed system of equations. (15 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

111552 Brownian motion lifetime and curvature conditions. J.-L.Ducourtieux (Univ. de Clermont, Aubiere, France). *C.R. Seances Acad. Sci. Ser. I (France)*, vol.296, no.18, p.769-72 (16 May 1983). In French.

The author discusses what conditions insure that the Brownian motion of a complete Riemannian manifold be conservative. (5 refs.)

111553 Mass dependence of the Kolmogorov-Arnold-Moser stability and low-order resonances in the kinetically coupled two-degree-of-freedom Morse system. T.Matsushita (Dept. of Chem., Keio Univ., Hiyoshi, Yokohama, Japan), T.Terasaka.

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.138-44 (2 Sept. 1983). The dependence of the mass ratio of the stability of Kolmogorov-Arnold-Moser surface around the central fixed point is numerically analyzed for the escape energy region in the kinetically coupled symmetric Morse system with two degrees of freedom. Strong third-order resonances, together with other weak resonances of higher order, are found for the approximate mass ratio $\delta=(1+\gamma)^{-1}=0.263$ at the dissociation threshold $E=1.0$ (in units of the dissociation energy) and for $\delta=0.293$ at $E=0.7$, an approximate lowest energy for a globally widespread chaos to develop. (20 refs.)

111554 Exact solutions of simple nonlinear difference equation systems that show chaotic behavior. T.Tsuchiya, A.Szabo (Lab. of Chem. Phys., Nat. Inst. of Arthritis, Diabetes & Digestive & Kidney Diseases, Bethesda, MD, USA), N.Saito.

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.1035-9 (Sept. 1983). Exact solutions are given for May's simple difference equation and the broken linear model, both for extreme values of the parameters, and the relation between these two systems for the solvable cases is clarified. The invariant measure and the correlation function for each case are calculated using the exact solutions. The initial-value dependence of the behavior of the solutions, chaotic or periodic, is completely determined. By using the exact solution, encounters of any two nonperiodic orbits can be precisely analyzed. (9 refs.)

111555 One-dimensional Brownian motion near an absorbing boundary: solution to the steady state Fokker-Planck equation. Y.S.Mayya (Health Phys. Div., Bhabha Atomic Res. Center, Bombay, India), D.C.Sahni.

J. Chem. Phys. (USA), vol.79, no.5, p.2302-7 (1 Sept. 1983). The problem of steady, one-dimensional Brownian motion under prescribed flux in the presence of an infinite plane absorbing boundary is discussed from the point of view of the eigenfunction expansion solution to the relevant Fokker-Planck equation. The expansion coefficients are determined by reducing it to a problem of the initial value type, using a parametrized Maxwellian for the velocity distribution of incoming particles only at the boundary. The number density function expressed in the form of an infinite series of exponentials is cast into a rapidly convergent form at the boundary layer. While some of the physical quantities obtained by this method are in essential agreement with those obtained by certain previous investigators, the following new results are to be noted: (i) the fractional power law variation of the number density in the vicinity of the boundary; and (ii) the complete vanishing of the space dependent diffusion coefficient at the boundary. The results are further discussed. (11 refs.)

111556 Exact results for diffusion on a disordered chain. P.J.H.Denteneer, M.H.Ernst (Inst. for Theoretical Phys., Utrecht, Netherlands).

J. Phys. C (GB), vol.16, no.27, p.L961-9 (30 Sept. 1983). The authors study diffusion on a chain with static disorder, characterised by random transition rates $\{w_n\}$ using an expansion in powers of the fluctuation $\delta_n=(w_n^{-1}-\langle w^{-1}\rangle)/\langle w^{-1}\rangle$ around the exact diffusion coefficient $D=1/\langle w^{-1}\rangle$ (low-frequency behaviour), or in powers of the fluctuation $\delta_n=(w_n-\langle w\rangle)/\langle w\rangle$ around the bare diffusion coefficient $D_0=\langle w\rangle$ (high-frequency behaviour). The former method yields a systematic expansion of the frequency-dependent diffusion coefficient $U_0(z)$, the single-site Green function $\langle \hat{p}_0(z) \rangle$ (spectral properties) and related quantities in powers of $\sqrt{z}(z\rightarrow 0)$; the latter method yields a systematic $1/z$ expansion ($z\rightarrow\infty$). The exact results for the transport properties show that the approximate results of effective medium or hypernetted chain approximations are incorrect at low frequencies beyond the \sqrt{z} terms. The results for the spectral properties of the chain agree with exact results for low and high frequencies. (13 refs.)

111557 Stochastic theory of adiabatic explosion. F.Baras, G.Nicolis, M.Malek Mansour, J.W.Turner (Univ. Libre de Bruxelles, Faculte des Sci., Bruxelles, Belgium).

J. Stat. Phys. (USA), vol.32, no.1, p.1-23 (July 1983). A stochastic description of an exothermic reaction leading to adiabatic explosion is set up. The numerical solution of the master equation reveals the appearance of a long tail and of multiple humps of the probability distribution which subsist for a certain period of time. During this interval the system displays a markedly chaotic behavior, reflecting the random character of the ignition process. An analytical description of this transient evolution is developed, using a piecewise linear approximation of the transition rates. A comparison with other transient phenomena observed in stochastic theory is carried out. (23 refs.)

111558 Critical fluctuations in a thermochemical instability. I. Mean field description. C.Van den Broeck (Dept. Natuurkunde, Vrije Univ. Brussel, Brussels, Belgium).

J. Stat. Phys. (USA), vol.32, no.1, p.153-68 (July 1983). The author calculates the temperature and concentration fluctuations in a homogeneous thermochemical model in the vicinity of a transition point

towards a multiple steady state regime. Enhanced fluctuations of 0.1% are predicted at a distance of 10^{-3} K from the critical point in a volume element of 10^{-3} mm³. (13 refs.)

111559 Relaxation time and randomness in phase space. M.Casartelli (Istituto di Fisica, Univ. di Parma, Parma, Italy).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.2, p.97-108 (11 Aug. 1983). The stochastic region in the phase space of a classical nonlinear system, a Lennard-Jones chain, is proven to be nonuniform with respect to a random access, through the sensitivity of the relaxation time to initial conditions. The dependence on various parameters is analysed and the results are interpreted geometrically as the effect of residual invariant tori in the stochastic domain. (11 refs.)

111560 Fractal dimension of the strange attractor in a piecewise linear two-dimensional map. T.Tel (Fachbereich Phys., Univ. Essen GHS, Essen, Germany).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.219-23 (5 Sept. 1983). The author calculates the fractal dimension of the strange attractor in the map $x'=ax-\text{sgn}(x)+bx, z'=x$. The method is based on the construction of the unstable manifolds of period-two points. The critical case characterized by heteroclinic tangents is investigated. (22 refs.)

111561 On the fractal dimension of the Henon attractor. P.Grassberger (Dept. of Phys., Univ. of Wuppertal, Wuppertal, Germany).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.224-6 (5 Sept. 1983). The author has re-measured the fractal dimension of the Henon attractor by direct box-counting. He has paid special attention to (a) optimal speed and use of storage, and (b) systematic corrections due to the finiteness of the number of iterations. Covering with grids of up to 9600×9600 boxes, he observes that the number $N(e,n)$ of boxes visited after n iterations obeys a scaling law $N(e,\infty)-N(e,n)\approx\text{const}\times e^{-\alpha}n^{-\beta}$ (for $n\rightarrow\infty$) with $\alpha=2.42\pm 0.15$, $\beta=0.89\pm 0.03$. Using this to extrapolate to $n\rightarrow\infty$, he obtains $D=1.28\pm 0.01$ in disagreement with previous box-counting estimates, but in agreement with a recent indirect evaluation. (11 refs.)

111562 Generalized dimensions of strange attractors. P.Grassberger (Dept. of Phys., Univ. of Wuppertal, Wuppertal, Germany).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.227-30 (5 Sept. 1983). It is pointed out that there exists an infinity of generalized dimensions for strange attractors, related to the order- q Renyi entropies. They are monotonically decreasing with q . For $q=0, 1$ and 2 , they are the capacity, the information dimension and the correlation exponent, respectively. For all q , they are measurable from recurrence times in a time series, without need for a box-counting algorithm. For the Feigenbaum map and for the generalized Baker transformation, all generalized dimensions are finite and calculable, and depend nontrivially on q . (20 refs.)

111563 Observation of a noise-induced phase transition with an analog simulator. J.Smythe, F.Moss (Dept. of Phys., Univ. of Missouri, St. Louis, MO, USA), P.V.E.McClintock.

Phys. Rev. Lett. (USA), vol.51, no.12, p.1062-5 (19 Sept. 1983). The first measurements are presented of the phase diagram of a noise-induced phase transition for a model, nonlinear system with multiplicative noise proposed by Horsthemke and Lefever (1977-80). Measurements of two of the critical exponents are also presented. The present results are in good agreement with theoretical predictions based on the Stratonovic treatment of the stochastic evolution equation. (13 refs.)

111564 Observations of order and chaos in nonlinear systems. H.L.Swinney (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.3-15 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Experiments on nonlinear electrical oscillators, the Belousov-Zhabotinskii reaction, Rayleigh-Benard convection, and Couette-Taylor flow have revealed several common routes to chaos that have also been found in numerical studies of models with a few degrees of freedom. Experimental results are presented illustrating the following transition sequences: period doubling and the U -sequence, intermittency, the periodic-quasiperiodic-chaotic sequence, frequency locking, and an alternating periodic-chaotic sequence. (101 refs.)

111565 Universal behavior in nonlinear systems. M.J.Feigenbaum (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.16-39 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

A semipopular account of the universal scaling theory for the period doubling route to chaos is presented. (10 refs.)

111566 Five turbulent problems. D.Ruelle (Inst. des Hautes Etudes Sci., Bures-sur-Yvette, France).

Physica D (Netherlands), vol.7D, no.1-3, p.40-4 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Five questions which involve strange attractors in one way or another are discussed. These are: the choice of probability measures to describe turbulence, the Hausdorff dimension of Julia sets for rational maps of the Riemann sphere, the existence of nonperiodic 'turbulent' crystal structure, the mechanism intermittency in developed hydrodynamic turbulence, the distribution of characteristic exponents in a turbulent fluid. (25 refs.)

111567 Oscillations and chaos in chemical systems. I.R.Epstein (Dept. of Chem., Brandeis Univ., Waltham, MA, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.47-56 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

The chemical community today views chemical chaos much as it did chemical oscillation 20 to 30 years ago. There are a number of 'enlightened' students of and believers in the phenomenon, but the vast majority of chemists are either ignorant or skeptical about the possibility of genuine chaos in a well-controlled chemical system. Major developments in the understanding of periodic chemical oscillation, including the recent systematic design of a new family of oscillators, are reviewed. The question of how closely linked periodic and chaotic behavior are in chemical systems is considered briefly, and implications for the design of chaotic systems are noted. Two systems are considered in some detail. The first, earlier reported as a photochemical oscillator and/or chaotic reaction, is shown to be a system of hydrodynamic rather than chemical interest. The second, one of the newly designed family of chlorite oscillators, exhibits many of the features found in experiments on chaos in the Belousov-Zhabotinskii reaction. It illustrates the close relation between complex periodic oscillations and chaos. Both examples serve to point out the origin of the present controversy over the existence of chemical chaos. (43 refs.)

111568 Experimental studies of bifurcations leading to chaos in the Belousov-Zhabotinsky reaction. J.-C.Boux (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.57-68 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

A review is presented of the experimental evidence of chemical chaos in the Belousov-Zhabotinsky reaction, with special emphasis on the bifurcations leading to the chaotic dynamics. It is shown that a simple 1D map can account for most of the exceptional observations. (30 refs.)

111569 Bifurcation and chaos in a periodically stimulated cardiac oscillator. L.Glass, M.R.Guevara, A.Shrier (Dept. of Physiology, McGill Univ., Montreal, Quebec, Canada), R.Perez.

Physica D (Netherlands), vol.7D, no.1-3, p.89-101 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Periodic stimulation of an aggregate of spontaneously beating cultured cardiac cells displays phase locking, period-doubling bifurcations and aperiodic 'chaotic' dynamics at different values of the stimulation parameters. This behavior is analyzed by considering an experimentally determined one-dimensional Poincaré or first return map. A simplified version of the experimentally determined Poincaré map is proposed, and several features of the bifurcations of this map are described. (53 refs.)

111570 Persistence properties of bifurcations. J.Guckenheimer (Div. of Natural Sci., Univ. of California, Santa Cruz, CA, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.105-10 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Reviews results about bifurcations which occur in families of differential equations. Persistent properties are defined to be those which remain when the family of equations is perturbed. The author provides a list of such properties which is relevant for numerical studies of dynamical systems. (23 refs.)

111571 On the attracting set for Duffing's equation. II. A geometrical model for moderate force and damping. P.Holmes, D.Whitley (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.111-23 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

After a brief review of some earlier work on Duffing's equation in the small force and damping regions, the authors use the results of numerical integrations to construct a geometrically defined Poincaré map which captures the qualitative features of the attracting set of larger force and damping levels. This map has a (small) constant Jacobian determinant and can be regarded as a perturbation of a non-invertible one-dimensional map. They give a partial analysis of the map and pose some important open questions regarding perturbations of one-dimensional maps and the reaction of 'strange attractors' during bifurcation in horseshoes. (42 refs.)

111572 Period doubling in one and several dimensions. O.E.Lanford (Inst. for Math. & its Applications, Univ. of Minnesota, Minneapolis, MN, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.124-5 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982). (3 refs.)

111573 The dimension of chaotic attractors. J.D.Farmer (Center for Nonlinear Studies & Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), E.Ott, J.A.Yorke.

Physica D (Netherlands), vol.7D, no.1-3, p.153-80 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Dimension is perhaps the most basic property of an attractor. The authors discuss a variety of different definitions of dimension, compute their values for a typical example, and review previous work on the dimension of chaotic attractors. The relevant definitions of dimension are of two general types, those that depend only on metric properties, and those that depend on the frequency with which a typical trajectory visits different regions of the attractor. Both this example and the previous work that they review support the conclusion that all of the frequency dependent dimensions take on the same value, which we call the 'dimension of the natural measure', and all of the metric dimensions take on a common value, which they call the 'fractal dimension'. Furthermore, the dimension of the natural measure is typically equal to the Lyapunov dimension, which is defined in terms of Lyapunov numbers, and thus is usually far easier to calculate than any other definition. Because it is computable and more physically relevant, they feel that the dimension of the natural measure is more important than the fractal dimension. (46 refs.)

111574 Crises, sudden changes in chaotic attractors, and transient chaos. C.Grebogi, E.Ott (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA), J.A.Yorke.

Physica D (Netherlands), vol.7D, no.1-3, p.181-200 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

The occurrence of sudden qualitative changes of chaotic dynamics as a parameter is varied is discussed and illustrated. It is shown that such changes may result from the collision of an unstable periodic orbit and a coexisting chaotic attractor. The authors call such collisions crises. Phenomena associated with crises include sudden changes in the size of chaotic attractors, sudden appearances of chaotic attractors (a possible route to chaos), and sudden destructions of chaotic attractors and their basins. They present examples illustrating that crisis events are prevalent in many circumstances and systems, and that, just past a crisis, certain characteristic statistical behavior (whose type depends on the type of crisis) occurs. In particular the phenomenon of chaotic transients is investigated. The examples discussed illustrate crises in progressively higher dimension and include the one-dimensional quadratic map, the (two-dimensional) Henon map, systems of ordinary differential equations in three dimensions and a three-dimensional map. In the case of our study of the three-dimensional map a new route to chaos is proposed which is possible only in invertible maps or flows of dimension at least three or four, respectively. Based on the examples presented the following conjecture is proposed: almost all sudden changes in the size of chaotic attractors and almost all sudden destructions or creations of chaotic attractors and their basins are due to crises. (21 refs.)

111575 Symbolic dynamics of noisy chaos. J.P.Crutchfield, N.H.Packard (Phys. Board of Studies, Univ. of California, Santa Cruz, CA, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.201-23 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

One model of randomness observed in physical systems is that low-dimensional deterministic chaotic attractors underlie the observations. A phenomenological theory of chaotic dynamics requires an accounting of the

information flow from the observed system to the observer, the amount of information available in observations, and just how this information affects predictions of the system's future behavior. In an effort to develop such a description, the authors discuss the information theory of highly discretized observations of random behavior. Metric entropy and topological entropy are well-defined invariant measures of such an attractor's 'level of chaos', and are computable using symbolic dynamics. Real physical systems that display low dimensional dynamics are, however, inevitably coupled to high-dimensional randomness, e.g. thermal noise. They investigate the effects of such fluctuations coupled to deterministic chaotic systems, in particular, the metric entropy's response to the fluctuations. They find that the entropy increases with a power law in the noise level, and that the convergence of the entropy and the effect of fluctuations can be cast as a scaling theory. They also argue that in addition to the metric entropy, there is a second scaling invariant quantity that characterizes a deterministic system with added fluctuations: I_0 , the maximum average information obtainable about the initial condition that produces a particular sequence of measurements (or symbols). (46 refs.)

111576 On the quadratic mapping $z \rightarrow z^2 - \mu$ for complex μ and z : the fractal structure of its M set, and scaling. B.B.Mandelbrot (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.224-39 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

For each complex μ , denote by $\mathcal{A}(\mu)$ the largest bounded set in the complex plane that is invariant under the action of the mapping $z \rightarrow z^2 - \mu$. Mandelbrot (1980, 1982) reported various remarkable properties of the M set (the set of those values of the complex μ for which $\mathcal{A}(\mu)$ contains domains) and of the closure M^* of M . The goals of the present work are as follows. A) To restate some previously reported properties of $\mathcal{A}(\mu)$, M and M^* in new ways, and to report new observations. B) To deduce some known properties of the mapping f for real μ and z , with $\mu \in [-1/4, 2]$ and $z \in [-1/2, 1/2] \sqrt{1+4\mu}$, $f_{1/2} + 1/2 \sqrt{1+4\mu}$. In many ways, the properties of the transformation f are easier to grasp in the complex plane than in an interval. (This exemplifies the saying that 'when one wishes to simplify a theory, one should complicate the variables'.) C) To serve as introduction of some recent pure mathematical work triggered by Mandelbrot 1980. Further pure mathematical work is strongly urged. (13 refs.)

111577 The twist map, the extended Frenkel-Kontorova model and the devil's staircase. S.Aubry (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.240-58 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Reviews exact results which the author obtained on the discrete Frenkel-Kontorova (FK) model and its extensions, during the past few years. These models are associated with area preserving twist maps of the cylinder (or a part of it) onto itself. The theorems obtained from the FK model thus yields new theorems for the twist maps. The author describes the exact structure of the ground-states which are either commensurate or incommensurate and assert the existence of elementary discommensurations under certain necessary and sufficient conditions. Necessary conditions for the trajectories to represent metastable configurations which can be chaotic, are given. The existence of a finite Peierls-Nabarro barrier for elementary discommensurations is connected with a property of non-integrability of the twist map. He next proves that the existence of KAM tori corresponds to 'undefectible' incommensurate ground-states and give a theorem which asserts that when the phonon spectrum of an incommensurate ground-state exhibits a finite gap, then the corresponding trajectory is dense on a Cantor set with zero measure length. These theorems, when applied to the initial FK model, allow one to prove the existence of the transition by 'breaking of analyticity' for the incommensurate structure when the parameter which describes the discrepancy of the model from the integrable limit varies. These theorems also allow one to obtain a series of rigorous upper bounds for the stochasticity threshold of the standard map which for the fifth order approximation already approaches within 25% the value which is numerically known. Finally, he describes a theorem proving the existence of a devil's staircase for the variation curve of the atomic mean distance versus a chemical potential, for certain properties of the twist map which are generally satisfied. (27 refs.)

111578 Influence of solitons in the initial state of chaos in the driven damped sine-Gordon system. A.R.Bishop, K.Fesser, P.S.Lomdahl (Center for Nonlinear Studies & Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), S.E.Trullinger.

Physica D (Netherlands), vol.7D, no.1-3, p.259-79 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

The appearance of chaos in the a.c. driven, damped sine-Gordon equation is studied numerically. Several transitions from periodic to chaotic behavior are investigated in detail for flat initial conditions. Spatial structures (breather, kink) in the initial conditions smooth out many of these transitions and give rise to an interesting symbiosis of time and spatial intermittency. This symbiosis appears to be due to the competition between the background tendency towards chaos and the system's preference to maintain a spatial pattern. The way that this competition is relieved is also found to depend very strongly on symmetry in the initial conditions. (15 refs.)

111579 A renormalisation approach to invariant circles in area-preserving maps. R.S.Mackay (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA).

Physica D (Netherlands), vol.7D, no.1-3, p.283-300 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).

Kadanoff and Shenker (1982) introduced a renormalisation approach to invariant circles in area-preserving maps. The present author makes more precise the connection between invariant circles and the renormalisation operator. Restricting attention to noble rotation numbers, the stability of a simple fixed point of the renormalisation is analysed, corresponding to a linear twist map. It is found to be essentially attracting, so that noble circles persist under perturbation, giving a new view on KAM theory. Shenker and Kadanoff found evidence for another fixed point, corresponding to a map with a non-smooth noble circle. Further evidence is given. It has essentially only one unstable direction, and its stable manifold is believed to give the boundary of the set of twist maps with a noble circle. Finally, noble circles are shown to be locally most robust, in an important sense. (34 refs.)

111580 Quasiperiodicity in dissipative systems: a renormalization group analysis. S.J.Shenker (James Franck Inst., Univ. of Chicago, Chicago, IL, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.301 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).
Abstract form only given. Dynamical systems with quasiperiodic behavior, i.e. two incommensurate frequencies, may be studied via discrete maps which show smooth continuous invariant curves with irrational winding number. These curves are followed using renormalization group techniques which are applied to a one-dimensional system (circle) and also to an area-contracting map of an annulus. Two fixed points are found representing different types of universal behavior: a trivial fixed point for smooth motion and a nontrivial fixed point. The latter represents the incipient breakup of a quasiperiodic motion with frequency ratio the Golden Mean into a more chaotic flow. Fixed point functions are determined numerically and via an ϵ -expansion and eigenvalues are calculated. (8 refs.)

111581 A universal transition from quasi-periodicity to chaos. E.D.Siggia (Dept. of Phys., Cornell Univ., Ithaca, NY, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.302 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).
Abstract form only given. A common route to chaos in dissipative systems proceeds from periodic to quasi-periodic flow (with two independent frequencies). Then, in the absence of rotational symmetry, the system generally mode locks before becoming turbulent. Beyond these qualitative features, the numerous experiments that have examined this regime differ in detail. Dynamical system theory had made the occurrence of the above transitions plausible but has provided no nontrivial quantitative and model independent information. This situation, on the theoretical side, has recently changed with a proposal on how to modify the experiments so as to make the transition to chaos occur in a quantitatively universal manner. The essence of the proposal follows from K.A.M. theory which is the weak coupling limit of the strong coupling problem relevant to the turbulent transition. In addition to the Rayleigh number, the experimenter must control a second parameter so as to maintain the frequency ratio in the quasi-periodic state at a fixed irrational value. (2 refs.)

111582 On dual spaces of differential Lie algebras. B.A.Kupersmidt (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA). *Physica D (Netherlands)*, vol.7D, no.1-3, p.334-7 (May 1983). (Proceedings of the International Conference on Order in Chaos, Los Alamos, NM, USA, 24-28 May 1982).
Presents a mathematical scheme which serves as an infinite-dimensional generalization of Poisson structures on dual spaces of finite-dimensional Lie algebras which are well known and widely used in classical mechanics. These structures have recently appeared in the theory of Lax equations, long waves in hydrodynamics, and various other physical models: compressible hydrodynamics, magnetohydrodynamics, multifluid plasmas, elasticity, superfluid ^4He and $^3\text{He-A}$, Ginzburg-Landau theory of superconductors, and classical chromohydrodynamics (the generalization of plasma physics to Yang-Mills interactions). (9 refs.)

111583 Correlation function behaviour in quantum systems which are classically chaotic. G.P.Berman, A.R.Kolovsky (L.V. Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR). *Physica D (Netherlands)*, vol.8D, no.1-2, p.117-41 (July 1983).
The time behaviour of a phase correlation function for dynamical quantum systems which are classically chaotic is considered. It is shown that under certain conditions there are three time regions of the quantum correlations behaviour; the region of classical stochasticity (exponential decay of quantum correlations); the region of the correlations decay with a power law; the region of the constant level of the quantum correlations. The boundaries of these time regions are presented. The estimation of a remaining level of the quantum correlations is given. (20 refs.)

111584 Some statistical properties of simple classically stochastic quantum systems. D.L.Shepelyansky (Inst. of Nuclear Phys., Novosibirsk, USSR). *Physica D (Netherlands)*, vol.8D, no.1-2, p.208-22 (July 1983).
Numerical studies are made of simple one- and two-dimensional quantum models which are stochastic in the classical limit. It is shown that the correlation properties of the quantum and corresponding classical motions are only similar for very short time intervals t_0 , and that the evolution of the quantum system, unlike the classical one, is stable. The diffusive excitation of the quantum system under a periodic perturbation is limited to a specific time interval $t^* \gg t_0$, during which the diffusion rate is similar to the corresponding classical diffusion rate. For the two-dimensional model, a continuous component in the correlation spectrum survives for an indefinite period $t_0 \gg t^*$. It is shown that the perturbation is quasiperiodic the interval t^* increases sharply. (18 refs.)

111585 Observation of a strange attractor. J.-C.Roux, R.H.Simoyi, H.L.Swinney (Dept. of Phys., Univ. of Texas, Austin, TX, USA). *Physica D (Netherlands)*, vol.8D, no.1-2, p.257-66 (July 1983).
Phase space portraits have been constructed and analyzed for noisy (non-periodic) data obtained in an experiment on a nonequilibrium homogeneous chemical reaction. The phase space trajectories define a limit set that is an 'attractor'—following a perturbation, the trajectory quickly returns to the attracting set. This attracting set is shown to be 'strange'—nearby trajectories separate exponentially on the average. Moreover, the Poincare sections exhibit the stretching and folding that is characteristic of strange attractors. (23 refs.)

111586 Universal properties of the transition from quasi-periodicity to chaos in dissipative systems. S.Ostlund, D.Rand, J.Sethna, E.Siggia (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA). *Physica D (Netherlands)*, vol.8D, no.3, p.303-42 (Sept. 1983).
An exact renormalization group transformation is developed for dissipative systems which describes how the transition to chaos may occur in a continuous and universal manner if the frequency ratio in the quasi-periodic regime is held at a fixed irrational value. The approach is a natural extension of KAM theory to strong coupling. Most of our analysis is for analytic circle maps. The authors have found a strong coupling fixed point where invertibility is lost, which described the universal features of the transition to chaos. They find numerically that any two such critical maps with the same winding number are C^1 conjugate. It follows that the low frequency peaks in an experimental spectrum are universal and they determine how their envelope scales with frequency. When the winding number has a periodic continued fraction, their renormalization transform has a fixed point and spectra are self similar in addition. For a set of non-periodic winding numbers with full measure their renormalization transformation yields an ergodic trajectory in a sub-space of all critical maps. Physically they find singular and universal spectra that do not scale. (40 refs.)

111587 A simple dynamical system with stochastic behaviour. B.A.Malomed (Inst. of Biological Phys., Acad. of Sci., Moscow, USSR). *Physica D (Netherlands)*, vol.8D, no.3, p.343-52 (Sept. 1983).
The author treats a dynamical system consisting of two quasiharmonic limit cycles cut off by stall lines. A phase trajectory inside a cycle jumps infinitely quickly to another cycle after having reached the stall line. This dynamical system can be interpreted as an asymptotical form of a system of three differential equations admitting separation of fast and slow motions. The explicit conditions on parameters of the system providing its stochastic behaviour, i.e. local instability of all trajectories, are obtained by means of investigation of the Poincare mapping. A lower estimate for the topological entropy of the system is also obtained. The appendix concerns investigation of some properties of a system consisting of stochastic oscillators of the most simple kind connected by diffusion. (5 refs.)

111588 Long-time correlations in the stochastic regime. C.F.F.Karney (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA). *Physica D (Netherlands)*, vol.8D, no.3, p.360-80 (Sept. 1983).
The phase space for Hamiltonians of two degrees of freedom is usually divided into stochastic and integrable components. Even when well into the stochastic regime, integrable orbits may surround small stable regions or islands. The effect of these islands on the correlation function for the stochastic trajectories is examined. Depending on the value of the parameter describing the rotation number for the elliptic fixed point at the center of the island, the long-time correlation function may decay as t^{-5} or exponentially, but more commonly it decays much more slowly (roughly as t^{-1}). As a consequence these small islands may have a profound effect on the properties of the stochastic orbits. In particular, there is evidence that the evolution of a distribution of particles is no longer governed by a diffusion equation. (16 refs.)

111589 The infinite number of generalized dimensions of fractals and strange attractors. H.G.E.Hentschel, I.Proccaccia (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel). *Physica D (Netherlands)*, vol.8D, no.3, p.435-44 (Sept. 1983).
The authors show that fractals in general and strange attractors in particular are characterized by an infinite number of generalized dimensions D_q , $q > 0$. To this aim they develop a rescaling transformation group which yields analytic expressions for all the quantities D_q . They prove that $\lim_{q \rightarrow 0} D_q = \text{fractal dimension } (D)$, $\lim_{q \rightarrow 1} D_q = \text{information dimension } (q)$ and $D_{q=2} = \text{correlation exponent } (v)$. D_q with other integer q 's correspond to exponents associated with ternary, quaternary and higher correlation functions. They prove that generally $D_q > D_{q'}$ for any $q' > q$. For homogeneous fractals $D_q = D_{q'}$. A particularly interesting dimension is $D_{q=\infty}$. For two examples (Feigenbaum attractor, generalized baker's transformation) they calculate the generalized dimensions and find that D_{∞} is a non-trivial number. All the other generalized dimensions are bounded between the fractal dimension and D_{∞} . (22 refs.)

111590 On the representation of solutions of nonlinear equations as an integral over the set of trajectories of a random process. V.Vagner, S.M.Ermakov (A.A. Zhdanov State Univ., Leningrad, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1022-4 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1346-9 (Dec. 1982). [received: Sept. 1983]
Let $\phi = P(\phi)$ be a functional equation where P is a continuous operator in a certain Banach space B of functions ($\phi \in B$). The authors consider the problem of representing a solution of the equation as an integral over a (probability) measure on the trajectories of a Markov process. Representations of this type are of interest from both a theoretical and an applied point of view in connection with the construction of algorithms of the Monte Carlo method and other algorithms which can conveniently be used on multiprocessor computers. (4 refs.)

111591 Stationary probability distribution for one of the simplest strange attractors. P.S.Landa, R.L.Stratonovich (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1032-4 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.832-6 (Dec. 1982). [received: Sept. 1983]
It is well known that stochastic self-oscillations occur in many dynamical systems over a wide range of parameters, even in the absence of random external actions. In phase space these self-oscillations in the steady state correspond to an entire domain, which is called a strange attractor. The indicated stochastic oscillations can be described by a stationary probability distribution for the points of phase space in the attractor domain. In contrast with the case of periodic or almost periodic oscillations, this distribution does not have the nature of a delta function. (8 refs.)

111592 Diffusion across characteristics boundaries with critical points. B.J.Matkowsky (Dept. of Engng. Sci. & Appl. Math., Northwestern Univ., Evanston, IL, USA), Z.Schuss, C.Tier. *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.673-95 (Aug. 1983).
The authors consider the problems of the effect of small white noise perturbations on a deterministic dynamical system in the plane with (i) an asymptotically stable equilibrium point or limit cycle and (ii) an equilibrium point surrounded by closed trajectories. The mean exit time and the distribution of exit points for each problem is determined by solving singularly perturbed elliptic boundary value problems in domains with closed characteristic boundaries with critical points. Uniformly valid asymptotic solutions are constructed for each of the problems. For the asymptotically stable equilibrium point, the method of matched asymptotic expansions with the integral condition of Matkowsky and Schuss is (1977) is employed. A method of averaging combined with boundary layer analysis is used for the problem of an equilibrium point surrounded by closed trajectories. The influence on the solutions, of the critical points on the boundary, is exhibited and explained. An application to the physical pendulum is given. Finally the authors' results are shown to be in close agreement with simulations. (13 refs.)

111593 Amplitude equations for systems with competing instabilities. P.H.Couillet, E.A.Spiegel (Astron. Dept., Columbia Univ., New York, NY, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.776-821 (Aug. 1983).
The authors describe how to derive ordinary differential equations to predict the time dependence of a system governed by partial differential equations when that system is near to the polycritical condition for the onset of several instabilities. The method is illustrated for the general case of two competing instabilities and then a specific physical example of this case is worked out in detail. The basic idea is to extend the Krylov-Bogolyubov-Mitropolsky method of nonlinear mechanics to bifurcation problems. (72 refs.)

111594 Dynamic theory of suspensions with Brownian effects. R.Caflisch (Dept. of Math., Stanford Univ., Stanford, CA, USA), G.C.Papanicolaou. *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.885-906 (Aug. 1983).
The authors consider a suspension of particles in a fluid settling under the influence of gravity and dispersing by Brownian motion. A mathematical description is provided by the Stokes equations and a Fokker-Planck equation

for the one-particle phase space density. This is a nonlinear system that depends on a number of parametric functions of the spatial concentration of the particles. These functions are known only empirically or for dilute suspensions. The authors analyze the system, its stability, is asymptotic behavior under different scalings and its validity from more microscopic description. They summarize their conclusions at the end. (25 refs.)

111595 Propagation of chaos and the Burgers equation. E.Gutkin (Columbia Univ., New York, NY, USA), M.Kac. *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.971-80 (Aug. 1983).

The authors establish a connection between the Burgers equation and the limit of an N -body problem when $N \rightarrow \infty$. Then they use this connection to linearize the Burgers equation. (3 refs.)

05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

111596 Algebraic structure of Toda systems. D.I.Olive, N.Turok (Dept. of Math. & Phys., Univ. of Virginia, Charlottesville, VA, USA). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.491-507 (5 Sept. 1983).

Following the Leningrad school an operator P is constructed which guarantees the classical complete integrability of the Toda molecule and Toda lattice equations. This quantity depends in a uniform way upon the root system of the underlying algebra, respectively the simple Lie algebras and the affine euclidean Kac-Moody algebras. (20 refs.)

111597 Invasion percolation: a new form of percolation theory. D.Wilkinson, J.F.Willemsen (Schlumberger-Doll Res., Ridgefield, CT, USA). *J. Phys. A (GB)*, vol.16, no.14, p.3365-76 (1 Oct. 1983).

A new kind of percolation problem is described which differs from ordinary percolation theory in that it automatically finds the critical points of the system. The model is motivated by the problem of one fluid displacing another from a porous medium under the action of capillary forces, but in principle it may be applied to any kind of invasion process which proceeds along a path at least resistance. The name invasion percolation is proposed for this new process. Similarities to, and differences from, ordinary percolation theory are discussed. (17 refs.)

111598 A new candidate for the universality class of disordered electron models? J.E.Green (Dept. of Theoretical Phys., Univ. of Manchester, Manchester, England). *J. Phys. C (GB)*, vol.16, no.27, p.5245-53 (30 Sept. 1983).

The authors consider for the behaviour of disordered electrons which has the Hamiltonian $H = \sum_{ij} (\delta_{ij} \sum_k J_{ik} J_{kj}) |i\rangle \langle j|$ where J_{ij} is a random variable. It is shown that to first order in perturbation theory this model is in the same universality class as the Anderson tight-binding model and the random matrix ensemble model. (14 refs.)

111599 Impurity dynamics in a one-dimensional chain. D.F.Calef (Dept. of Chem., MIT, Cambridge, MA, USA). *J. Stat. Phys. (USA)*, vol.32, no.1, p.81-94 (July 1983).

The behavior of an impurity spin in a one-dimensional chain is investigated using the Glauber model. Two different types of impurities are considered and exact expressions for the average spin of the impurity, given that the impurity was initially excited out of equilibrium, are found. The behavior of these models is discussed in detail and their relevance to other physical situations is considered. (10 refs.)

111600 The thermodynamic limit for long-range random systems. A.C.D.van Enter, J.L.van Hemmen (Univ. Heidelberg, Heidelberg, Germany). *J. Stat. Phys. (USA)*, vol.32, no.1, p.141-52 (July 1983).

Long-range spin systems with random interactions are considered. A simple argument is presented showing that the thermodynamic limit of the free energy exists and depends neither on the specific random configuration nor on the sample shape, provided there is no external field. The argument is valid for both classical and quantum spin systems, and can be applied to (a) spins randomly distributed on a lattice and interacting via dipolar interactions, and (b) spin systems with potentials of the form $J(x_1, x_2)/|x_1 - x_2|^{\alpha d}$, where the $J(x_1, x_2)$ are independent random variables with mean zero, d is the dimension, and $\alpha > 1/2$. The key to the proof is a (multidimensional) subadditive ergodic theorem. As a corollary the authors show that, for random ferromagnets, the correlation length is a nonrandom quantity. (18 refs.)

111601 Critical behaviour of the hard-core lattice gas on the honeycomb lattice. J.-M.Debierre, L.Turban (Lab. de Phys. du Solide, ENSMIM, Nancy, France).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.235-8 (5 Sept. 1983).

The hard triangle lattice-gas model (lattice-gas on the honeycomb lattice with first neighbour exclusion) is studied by the phenomenological renormalization method. The critical activity is found to be $z = 7.85$ and the critical exponents suggest that this model belongs to the 2-D Ising universality class. (10 refs.)

111602 Domain walls and shape dependence in the two-dimensional Ising-model critical region. P.Kleban, G.Akinci (Dept. of Phys. & Astron., Univ. of Maine, Orono, ME, USA).

Phys. Rev. Lett. (USA), vol.51, no.12, p.1058-61 (19 Sept. 1983).

Ferdinand and Fisher (1969) have discovered some unusual lattice-shape effects on the finite size-induced specific heat peak shift in the two-dimensional Ising-model critical region. It is shown that they are well approximated by keeping only the two largest eigenvalues of the transfer matrix, and may be expressed entirely in terms of a one-dimensional Ising array of domain walls. Approximate expressions for the effective coupling and number of spins are given. It is also pointed out that in general domain walls should be thermodynamically important for such finite-size effects. (14 refs.)

111603 New spontaneous symmetry breaking for the cubic XY model. S.Galam, J.L.Birman (Dept. of Phys., City Coll., City Univ. of New York, New York, NY, USA).

Phys. Rev. Lett. (USA), vol.51, no.12, p.1066-8 (19 Sept. 1983).

A Landau expansion including sixth- and eighth-degree terms is studied for the cubic XY model. A new ordered phase with 'generic symmetry' is found. The angle of rotation θ of the associated order parameter depends continuously on temperature. The transition from the disordered phase into this new phase must always be first order, irrespective of both the sign of the quartic term and the inclusion of higher-degree terms in the expansion. This prediction can be verified experimentally by studying the temperature dependence of θ . $\text{Tb}_2(\text{MoO}_4)_3$ should be a good candidate. (9 refs.)

111604 The breadth of the lattice of those varieties of inverse semigroups which contain the variety of groups. N.R.Reilly (Dept. of Math., Simon Fraser Univ., Burnaby, BC, Canada).

Proc. R. Soc. Edinburgh Sect. A (GB), vol.93, pt.3-4, p.319-25 (1983).

The author defines two sublattices on a lattice of varieties of inverse semigroups. The breadth of one of the sublattices is determined, from which it follows that the other sublattice has the same breadth. Some consequences concerning varieties generated by fundamental inverse semigroups are also considered. (8 refs.)

111605 Renormalization-group study of the Hamiltonian version of the Potts model. III. Improved results for larger cells. F.Igloi, J.Solyom (Central Res. Inst. for Phys., Budapest, Hungary).

Phys. Rev. B (USA), vol.28, no.5, p.2792-9 (1 Sept. 1983).

For pt.II see *ibid.*, vol.28, no.5, p.2785 (1983). The renormalization-group transformation, applied earlier to the Hamiltonian Potts model to study the crossover from second-order to first-order transition as the number of states q increases, is extended by taking larger cells in the block transformation. The results improve systematically with increasing block size. The critical value of q above which the transition is of first order, seems to converge to 5 instead of the exactly known value $q_c = 4$. The classical equivalents of the new couplings, which drive the system to the first-order transition, are discussed. (9 refs.)

111606 Nonlinear vector waves in a mechanical model of a molecular chain. O.B.Gorbacheva, L.A.Ostrovsky (Inst. of Appl. Phys., Acad. of Sci., Gorky, USSR).

Physica D (Netherlands), vol.8D, no.1-2, p.223-8 (July 1983).

Transverse nonlinear waves in a one-dimensional lattice with elastic bonds under longitudinal stress are investigated taking into account a possibility of lattice rotations. The main types of wave motion are found in the continuum approximation including helical waves and rotation discontinuities, as well as solitons in the form of plane displacements of the lattice and local 'contractions' of the helical wave. The simplest estimates of possible parameters of such waves in molecular chains are given for a polyacetylene molecule. (8 refs.)

111607 Scattering of lattice solitons from a mass interface—A synergetic approach. T.Klinker, W.Lauterborn (Third Phys. Inst., Univ. of Gottingen, Gottingen, Germany).

Physica D (Netherlands), vol.8D, no.1-2, p.249-56 (July 1983).

A special mathematical method—a synergetic approach combining analytical and numerical procedures—is developed to study how a Toda lattice soliton is scattered from a mass interface. The method is based on the inverse scattering transform and the spectral theorem for self-adjoint operators. The laws for the scattering processes are given in a series of diagrams. (11 refs.)

111608 The discrete Frenkel-Kontorova model and its extensions. I. Exact results for the ground-states. S.Aubry, P.Y.Le Daeron (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).

Physica D (Netherlands), vol.8D, no.3, p.381-422 (Sept. 1983).

The authors present a rigorous study of the classical ground-states under boundary conditions of a class of one-dimensional models generalizing the discrete Frenkel-Kontorova model. The extremalization equations of the energy of these models turn out to define area preserving twist maps which exhibits periodic, quasi-periodic and chaotic orbits. For all boundary conditions, they select among all the extremum solutions of the energy of the model, those which correspond to the ground-states of the infinite system. They prove that these ground-states are either periodic (commensurate) or quasi-periodic (incommensurate) but are never chaotic. They also prove the existence of elementary discommensurations which are minimum energy configuration of the model for certain special boundary conditions. The topological structure of the whole set of ground-states is described in detail. In addition to physical applications, consequences for twist map homeomorphisms are mentioned. (35 refs.)

111609 Stability of nonlinear modes and chaotic properties of 1D Fermi-Pasta-Ulam lattices. N.Budinsky, T.Bountins (Inst. for Nonlinear Studies, Clarkson Coll. of Technol., Potsdam, NY, USA).

Physica D (Netherlands), vol.8D, no.3, p.445-52 (Sept. 1983).

The stability properties of certain simple periodic solutions (nonlinear modes) of the equations of motion of one-dimensional, N -particle FPU lattices, are obtained analytically by uncoupling the N linear variational equations. The energy per particle E_c/N at which these modes first become unstable is calculated and its asymptotic behavior as $N \rightarrow \infty$ is determined. The authors find that for lattices which experience strong energy sharing $E_c/N \rightarrow 0$ as $N \rightarrow \infty$, while for a lattice where little energy sharing is observed $E_c/N \rightarrow \text{const} > 0$, as N increases. Certain possible connections between the local stability results and some global chaotic properties of FPU lattices are discussed. (23 refs.)

111610 Formation of large groups of recombining particles of the same type of excitation (two- and three-dimensional continuous models). V.V.Antonov-Romanovskii (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.341-2 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.599 (Feb. 1983). [received: Sept. 1983]
Calculations within a one-dimensional continuous model indicate that prolonged excitation due to recombination between two types of particle A and B leads to the formation of groups of particles of the same type containing on the average about 100 particles. The aforementioned treatment is based on the calculation of the probability w_0 of finding a particle of type B to be the nearest particle lying to the right of a particle of type A. It is also necessary to determine the distance X between groups of alternate particles. The author uses the same method. However, he can no longer classify particles as lying to the 'right' or 'left' since neighboring particles can lie along arbitrary directions relative to the initial particle. Consequently, he is faced with the problem of a 'reasonable' restriction of all possible directions. (2 refs.)

111611 Untersuchungen zur statistischen Mechanik von linearen Polymeren unter verschiedenen physikalischen Bedingungen (Investigation of the statistical mechanics of linear polymer molecules under various physical conditions). K.Kremer.
Report JUL-1832, Kernforschungsanlage, Julich, Germany (March 1983), 214 pp. In German.
The statistical mechanics of chain molecules is investigated for various physical conditions. As a model for such chain molecules the author uses the self-avoiding-walk (SAW) on a diamond lattice. Because mainly numerical methods are used, various Monte Carlo techniques are tested and analysed. (143 refs.)

111612 Critical behaviour of a quantum spin problem with three-spin coupling. F.Igloi, D.Kapor, J.Solyom, M.Skrinjar.
Report KFKI-1983-62, Hungarian Acad. Sci., Budapest (1983), 13 pp.
The critical behaviour of an Ising like model with three-spin coupling is studied in a transverse field. A self-dual renormalisation group transformation can be applied which gives well converging results for the critical exponents when large enough cells are taken. Finite size scaling on the same model gives comparable results. (8 refs.)

05.60 TRANSPORT PROCESSES: THEORY

111613 On the limiting law solution of the cylindrical Poisson-Boltzmann equation for polyelectrolytes. T.Odijk (Dept. of Phys. & Macromolecular Chem., Univ. of Leyden, Leyden, Netherlands).
Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.145-50 (2 Sept. 1983).
Upper and lower bounds are given for the behaviour of the Poisson-Boltzmann potential of a highly charged, cylindrical polyelectrolyte in excess salt solution as the salt concentration or cylinder radius tends to zero. The exact singular behaviour of the potential very close to the cylinder is given in terms of a delta function. (16 refs.)

111614 Quantitative maximum principles and strongly coupled gradient-like reaction-diffusion systems. N.D.Alikakos (Dept. of Math., Heriot-Watt Univ., Edinburgh, Scotland).
Proc. R. Soc. Edinburgh Sect. A (GB), vol.94, pt.3-4, p.265-86 (1983).
The author considers a system of reaction-diffusion equations with general diffusion matrix and establishes the stabilization of all solutions at $t \rightarrow \infty$. The interest of this problem derives from two separate facts. First, the sets that are useful for localizing the asymptotics cease to be invariant as soon as the diffusion matrix is not a multiple of the identity. Secondly, the set of equilibria is connected. (33 refs.)

111615 Thermal waves in an absorbing and convecting medium. P.Rosenau (Faculty of Mech. Engng., Technion-Israel Inst. of Technol., Haifa, Israel), S.Kamin.
Physica D (Netherlands), vol.8D, no.1-2, p.273-83 (July 1983).
The quasi-linear parabolic equation $\partial_t u = a \partial_{xx} u^a + b \partial_x u^b - cu^c$ exhibits a wide variety of wave phenomena, some of which are studied in this work; and some solvable cases are presented. The motion of the wave front is characterized in terms of α , β and γ . Among the interesting phenomena the authors note the effect of fast absorption ($b=0$, $0 < \gamma < 1$) that causes extinction within a finite time, may break the evolving pulse into several sub-pulses and causes the expanding front to reverse its direction. In the convecting case ($c=0$, $b \neq 0$) propagation has many features in common with Burgers equation, $\alpha=1$; particularly, if $0 < a \leq 1$, a shock-like transit layer is formed. (15 refs.)

111616 Singular problems in the theory of stress-assisted diffusion. V.Alexiades (Dept. of Math., Univ. of Tennessee, Knoxville, TN, USA), E.C.Aifantis.
SIAM J. Math. Anal. (USA), vol.14, no.5, p.925-33 (Sept. 1983).
A recently developed stress-assisted diffusion theory is further substantiated by establishing the well-posedness of relevant (degenerate parabolic) initial-boundary value problems for a plane with a slit. (12 refs.)

05.70 THERMODYNAMICS
(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

111617 Mathematical theory of phase transitions [Ising model]. S.Mukhopadhyay (S.N. Bose Inst. of Phys. Sci., Univ. of Calcutta, Calcutta, India).
Indian J. Phys. Part A, vol.57A, no.3, p.164-9 (May 1983).
In an effort to make operator algebraic methods available for the treatment of cooperative phenomena, the Ising model of ferromagnetism is investigated. Von Neumann's statistical operator U has been computed in each case. Finally the forms of U have been suggested for the respective cases. Applications of U to other thermodynamic inequalities relevant to phase transitions are discussed. (8 refs.)

111618 On the derivation of $dQ=T dS$. J.Dunning-Davies (Dept. of Appl. Math., Univ. of Hull, Hull, England).
J. Phys. A (GB), vol.16, no.14, p.3377-83 (1 Oct. 1983).
The traditional approach using Carnot cycles to the problem of establishing the existence of absolute temperature and entropy and to deriving $dQ=T dS$ is shown to remain valid for systems whose entropy is non-extensive as well as for systems whose entropy is extensive. However, it is seen that the analytical approach to this problem is valid only for systems whose entropy is extensive. Two methods for resolving this difficulty are presented. (11 refs.)

111619 The entropy of the BKW solution. C.J.Tourenne (Phys. Dept., Maharishi Internat. Univ., Fairfield, IA, USA).
J. Stat. Phys. (USA), vol.32, no.1, p.71-80 (July 1983).
The entropy of the d -dimensional generalization of the BKW solution of the homogeneous Boltzmann equation is calculated and expressed for $d=3$ in terms of error functions. It is verified that the McKean (1966) conjecture cannot hold in most of the time domain where the d -dimensional BKW solution is defined. (21 refs.)

111620 Metricization of thermodynamic state space and the renormalization group. L.Diosi, G.Forgacs, B.Lukacs, H.L.Frisch.
Report KFKI-1983-53, Hungarian Acad. Sci., Budapest (1983), 14 pp.
After introducing a suitable Riemannian metric in thermodynamic state space, with a simple statistical thermodynamic interpretation, it is shown that the existence of scaling must imply the existence of a conformal Killing vector field in the neighbourhood of a critical point. (9 refs.)

06.00 MEASUREMENT SCIENCE, GENERAL LABORATORY TECHNIQUES, AND INSTRUMENTATION SYSTEMS

06.20 METROLOGY

06.20D Measurement and error theory

111621 On the problem of estimating the mean value, correlation function and the spectral density of a stationary random function on the basis of single realisation. L.Kubackova, L.Kubacek.
Elektrotech. Cas. (Czechoslovakia), vol.34, no.5, p.370-8 (1983). In Slovak.
In processing experimental results, it is often necessary to carry out statistical evaluation of the mean value, correlation function and spectral density of a random function. Necessary and sufficient conditions for the evaluation of these variables on the basis of a single realisation are presented. Using as an example a periodic normal stationary signal, it is shown which statistical characteristics can and which cannot be determined from a single measurement. (8 refs.) E.D.

111622 Error analysis of measurement results. M.Mojzis.
Elektrotech. Cas. (Czechoslovakia), vol.34, no.6, p.449-50 (1983). In Slovak.
Simplified formulas and diagrams which can be used for statistical evaluation of measurement errors are presented. The diagrams enable determination of an error on the basis of the known probability and number of experiments. Alternatively, for a predetermined value of probability, it is possible to determine the number of experiments which will ensure that the maximal error required will not be exceeded. (1 ref.) E.D.

111623 Determination of limits for a linear regression or calibration curve. W.H.Swallow (North Carolina State Univ., Raleigh, NC, USA), J.R.Trout.
J. Qual. Technol. (USA), vol.15, no.3, p.118-25 (July 1983).
Trace analysis has become increasingly more important because of its connection with recent environmental, chemical, and biological concerns; therefore, measurement techniques often must be evaluated particularly for their ability to measure low concentrations with acceptable accuracy and precision. A methodology is presented here for determining objectively the lower (or upper) limit associated with a linear regression; that is, the point below (or above) which a regression model fails. Methods are also given for determin-

ing, provided the data include multiple observations at some x values, whether problems observed beyond the limit are due to increased variability of the breakdown of the linear relationship. The methodology is applied to calibration curve data from four chlorine measurement techniques, to estimate lower limits and to show that the principal problem found below the lower limit is dramatically increased variability. (9 refs.)

111624 Progress in metrological support of measuring-computing means. E.I.Tsvetkov, V.N.Ivanov (All-Union Res. Inst. of Electromeasuring Instruments, Leningrad, USSR), G.I.Kavalerov. Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.21-35 vol.1. The important trends in the development of procedures and means for determining the characteristics of errors in measurement results are discussed. On the basis of an adequate formal description of a measurement procedure, four types of measuring problems are considered as applied to a case when the execution is obtained with the aid of measuring-computing means. The structure of appropriate errors is determined. Three procedures for obtaining the error and error component characteristics are brought into comparison: the analytical, experimental and computer-aided. Type structures of the reference measuring-computing means are given for the experimental procedure. (no refs.)

A further development in error reduction modelsSee Entry 111708

06.20F Units

111625 Legal physical units. J.M.Massalski (Akad. Gorniczo-Hutnicza, Krakow, Poland). *Postępy Fiz. (Poland)*, vol.34, no.3, p.293-301 (1983). In Polish. Definitions of the SI units and the legal status of these units in Poland are presented. (9 refs.)

06.20H Measurement standards and calibration

111626 A note on the interpretation of activation measurements on the Princeton large torus. J.D.Strachan (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA), G.Zankl. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.551-2 (1 Sept. 1983).

Foil orientation is found to be unimportant in the interpretation of ^{113}In activation measurements around the PLT fusion experiment. (3 refs.)

111627 Calculating scaling factors—it's easy once you know how. A.L.Nuaimi (Gulf Canada Products Co., Toronto, Ontario, Canada). *Can. Controls & Instrum. (Canada)*, vol.22, no.4, p.16-17 (July 1983). Computational devices are used extensively in combustion control and generally whenever a control or measurement network is required to implement a mathematical process equation. The accurate evaluation of the scaling factors is essential for the controls to perform as intended. This paper describes three methods for calculating these factors. (no refs.)

111628 Estimation of parameters in models for cesium beam atomic clocks. P.V.Tryon, R.H.Jones (NBS, Boulder, CO, USA). *J. Res. Natl. Bur. Stand. (USA)*, vol.88, no.1, p.3-16 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors present an introduction to the use of the Kalman filter in modelling atomic clocks and obtaining maximum likelihood estimates of the model parameters from data on an ensemble of clocks. Tests for the validity of the model and confidence intervals for the parameter estimates are discussed. Techniques for dealing with unequally spaced and partially or completely missing multivariate data are described. The existence of deterministic frequency drifts in clocks is established and estimates of the drifts are obtained. (9 refs.)

111629 Estimating time from atomic clocks. R.H.Jones, P.V.Tryon (NBS, Boulder, CO, USA). *J. Res. Natl. Bur. Stand. (USA)*, vol.88, no.1, p.17-24 (Jan.-Feb. 1983). [received: Sept. 1983]

A Kalman recursive algorithm for estimating time from an ensemble of atomic clocks has been developed. The algorithm allows for the addition or deletion of clocks at any time, and provides automatic error detection and correction. The observations consist of time differences between clocks and may be taken at unequally spaced time points. Maximum likelihood estimates of the unknown parameters are obtained with confidence intervals as well as hypothesis tests to determine whether the estimated parameters are significantly different from zero. (4 refs.)

111630 Transducer calibration supported by a computer and a data bank system. O.Krull, A.Happe, P.-D.Reif (Res. & Dev. Volkswagenwerk AG, Wolfsburg, Germany). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.515-24 vol.2

There is an important reason to support the transducer calibration procedure by a computer system, if the number of transducers to be calibrated per day is high and the calibration laboratory staff is relatively small. The computer leads the operator of the calibration system through the calibration procedure, takes care for the correct status of the calibration system and gives information about each step. The new calibration data are automatically transferred to a data bank system from which each user can recall them. This results in an output of approximately 10 calibrations per day. (no refs.)

111631 Macroscopic quantum phenomena in metrology. Yu.V.Tarbee (Mendeleyev Inst., Leningrad, USSR). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.571-5 vol.2

Macroscopic quantum phenomena have a special significance for further development of metrology as their use makes possible the change-over to natural standards in a number of fields. Apart from theoretical considerations some of the experiments performed at VNIIM are described. Among these are efforts aimed at the establishment of new standards of electrical resistance and force and improvement of a number of fundamental physical constants. (5 refs.)

06.30 MEASUREMENT OF BASIC VARIABLES

111632 Behaviour of manganin gauges in solid pressure-transmitting media. T.Yamamoto, T.Kozuka, R.Kaneda (Nat. Res. Lab. of Metrology, Tokyo, Japan). *Rep. Gov. Ind. Res. Inst. Nagoya (Japan)*, vol.32, no.5-6, p.92-6 (May-June 1983). In Japanese.

The electrical resistance of a manganin coil embedded in solid pressure-transmitting media was measured under pressures up to about 6 GPa at room temperature. The relation between resistance and pressure was nearly linear, having the positive sign, at pressures higher than about 2 GPa, whereas a sharp drop in resistance was observed at an initial stage of loading. The volume discontinuities accompanying pressure-induced phase transitions both of NH_4F and Bi were observed by the corresponding drops in resistance of the manganin coil. (13 refs.)

Use of dielectric sensors in recording pressure pulsesSee Entry 111665

06.30C Spatial variables measurement

(inc. measurement of all variables extending in space e.g. diameter, height, thickness, displacement, surface topography, particle size, area of disperse systems)

111633 Technique for quantitative analysis of specimen microtopography using computer control of a scanning electron microscope. D.M.Holburn (Westfield Coll., Univ. of London, London, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.35-40 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

An automated method for quantitative determination of specimen topography is described in which a computer-controlled range finding technique is employed to measure the distance between the objective lens of a scanning electron microscope (SEM) and a set of distinct features on the specimen surface. Computations based on the spatial derivative of the image intensity allow the objective lens setting corresponding to the optimum focus for each feature to be determined, and this can be related to the feature height. Experimental results and theoretical analysis indicate that the sensitivity for discrimination of height differences is of the order of 1 μm . (13 refs.)

111634 Interferometric determination of slow movements. M.Bertolotti, A.Ferrari (Istituto di Fisica Ingegneria, Univ. di Roma, Roma, Italy), P.Jani, C.Sibilia.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.182-5 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A simple compact interferometric method is described which allows one to measure very slow movements. Application to the measurement of thermal dilatation of a semiconductor surface heated by a laser is discussed. (1 ref.)

111635 Surface coordinate measurement using high resolution TV cameras. L.J.Robinson (Blackett Lab., Imperial Coll., London, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.211-17 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Describes a system capable of measuring and storing the cylindrical coordinates describing the surface of a small object (<10 mm). Two TV cameras are used to view an illuminated section of the surface and the z and r coordinates are extracted from the video signals and stored on floppy disc. The resolution of these coordinates is $\sim 32 \mu\text{m}$. The θ coordinate is supplied by rotating the object so that a new section of the surface is analysed. The process is repeated until the whole surface has been covered. (2 refs.)

111636 Enhanced-displacement measurement using a generalized formulation for double-aperture specklegrams. M.A.Sutton (Dept. of Mech. Engng., Columbia, SC, USA), A.K.Wong, Y.J.Chao. *Exp. Mech. (USA)*, vol.23, no.3, p.348-53 (Sept. 1983).

A generalized form for the intensity distribution at the observation plane of a spatially filtered double-aperture specklegram is derived using classical Fresnel diffraction theory. The simplified formulas obtained by previous authors are found to be a special case of the general formula. In addition, both analytical and experimental results show that a variation in sensitivity of the double-aperture method exists within any given halo in the filter plane, even in the central DC halo. Also, in the DC halo analytical and experimental work has shown that displacements can be measured parallel to the embedded

grid present on the image, thereby demonstrating that a moire analogy is inadequate to fully describe the phenomena. Finally, a comparison of experimental data to theoretical results based on the generalized formulation demonstrates (a) that the limits proposed by the authors for measuring displacements by use of the double-aperture method are valid, and (b) that the double-aperture method can be extended to measure displacements beyond those predicted by a moire interpretation. (15 refs.)

111637 The validity of the Hertz equations when using mechanical sensing methods in length measuring equipment. F.Ludicke. *Feinwerktech. & Messtech. (Germany)*, vol.91, no.5, p.242-4 (July-Aug. 1983). In German.

The author explains that the sensing components in length measuring equipment are usually spherical while the surfaces to be measured are usually plane. He therefore pays special attention to the important instance where a ball touches a plane. The results can be transferred to curved surfaces. When a sphere touches a plane, Hertz produced an equation for the flattening (oblateness) of the ball at the point of contact which is an approximation to the undeformed regions of the ball and plane. This equation depends on five idealised assumptions. In actual situations the ideal smoothness of the ball and plane can only be approximately achieved by polished or very finely machined metal. From measurements made by this method the author concludes that the theory of Hertz is valid with only trivial deviations for all pairs of surfaces, even if the surfaces have slight errors in shape, provided that these surfaces have been polished. (11 refs.) *G.W.*

111638 Comparison of optical depth-measurement methods on real metal surfaces with sine-phase-gratings. K.D.Stock (Inst. fur Phys., Tech. Univ. Braunschweig, Braunschweig, Germany). *Optik (Germany)*, vol.65, no.2, p.85-96 (1983). In German. Using a special growth technique smooth copper crystals with sine-phase-gratings were prepared with line densities of 50 1/mm to 200 1/mm and profile depths up to 250 nm. These reflection gratings showed up imperfections caused by the preparation technique. To these real metal surfaces the following measurement methods were applied, two-beam-interference-microscopy with evaluation using equidensities; multiple-beam-interference-microscopy according to Tolinsky and diffraction of laser radiation. The author presents the theory and experimental measurement limits of the three methods. (22 refs.)

111639 A method for the estimation of micropore volume and micropore surface area. J.E.Shields, S.Lowell (Quantachrome Corp., Syosset, NY, USA). *Powder Technol. (Switzerland)*, vol.36, no.1, p.1-4 (Sept.-Oct. 1983). Micropore volumes have been estimated by comparing the results of mercury intrusion with helium displacement in porous samples. Differences in the surface area measured by gas adsorption and mercury porosimetry afford an estimation of micropore surface area and the micropore surface to volume ratio gives a mean micropore radius. (6 refs.)

111640 A study on the sizing process of an instrument based on the electrical sensing zone principle. I. The influence of particle material. G.van der Plaats, H.Herps (Corporate Res. & Patents Dept., DSM, Geleen, Netherlands). *Powder Technol. (Switzerland)*, vol.36, no.1, p.131-6 (Sept.-Oct. 1983). Although in principle the use of an instrument based on the electrical sensing zone principle is limited to insulating particles, in practice conductive particles can also be measured. The material of which the particle consists, however, strongly influences the response of such an instrument. The results are presented of a detailed study on the influence of the particle material on the response of an esz instrument. It is confirmed that the apparent resistance of a conductive particle is dependent on the voltage drop over the particle when it passes the orifice. Below a critical value, all particles act as insulators and particle sizes are measured correctly; above this value particles may act as a conductor, causing large deviations in the measured sizes. It is shown that for carbon this critical value is about 1-2 V, for noble metals (palladium) about 3 V and for base metals (nickel) about 9 V. (13 refs.)

111641 A performance test of a microphonic raindrop-sizemeter. K.Tohma, T.Ihara, H.Yamamoto, T.Manabe, Y.Furuhashi, K.Kitamura, Y.Imai. *Rev. Radio Res. Lab. (Japan)*, vol.28, no.147, p.503-19 (Sept. 1982). In Japanese. [received: Sept. 1983] A microphonic measuring system of raindrop size distribution and the shape of raindrops is discussed in connection with the millimeter wave attenuation caused by rainfall. A moving coil microphone with strong damping measures the raindrop size by sensing the momentum of drops falling into its vibration cone. It has shown remarkable performance for a broad region of drop sizes in drop-by-drop experiments, whereas in natural rain experiments it has shown rather reduced accuracy for small drops because of the shock absorbing role of the thick water film on the vibration cone. Waterdrops falling in stagnant air have been photographed, and they have proved to be of the shapes of the Pruppacher-Pitter type (1971). (9 refs.)

111642 Determination of the film thickness in localized epitaxial structures. D.I.Bilenko, N.P.Kazanova, V.P.Polyanskaya. *Sov. Microelectron. (USA)*, vol.12, no.1, p.43-8 (Jan.-Feb. 1983). Translation of: *Mikroelektronika (USSR)*, vol.12, no.1, p.70-5 (Jan.-Feb. 1983). [received: Sept. 1983] Modern complex multilayer structures for microelectronics, optoelectronics, and SHF electronics with pronounced patterns both in the plane and in the volume can be regarded as reflecting amplitude-phase gratings. Measurement of the parameters for such structure can be related to analysis of the radiation diffracted by the structure. The authors show that the diffraction ellipsometry method, which allows one to determine the thickness (d_2), of protective coatings in periodic structures and the depth (d_1) of the roughness between the protective coatings and the local epitaxial formation, has a high resolving power. It is effective in the region of variation of the phase thickness of the protective coating from 0.3 π to 0.7 π and has a good measurement precision of d_2 to 2-3 nm and d_1 to 5-9 nm. (9 refs.)

111643 Multi-function digital readout caliper. E.E.Carrico (Western Electric, Kansas City, KS, USA). *Tech. Dig. (USA)*, no.71, p.5-6 (July 1983). A digital readout caliper features a modified jaw having a special reference extension in addition to standard inside measurement tabs. A foreshortened length on one of the jaws relative to the other, together with the reference extension on the foreshortened jaw increase the measuring capabilities of the caliper. (no refs.)

111644 Application of surface acoustic waves for measuring linear and angular displacement. V.Snitko, A.Zabbarov, K.Ragulska (Vibrotech. Lab., Kaunas Polytech. Inst., Kaunas, Lithuanian SSR). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.85-90 vol.1 The possible application of surface acoustic waves for measuring linear and angular displacement has been discussed. The displacement transmitters have been developed and investigated. Theoretical and experimental investigations of transmitter measuring accuracy have been presented. Different methods of measuring on surface acoustic waves (SAW) have been discussed. (2 refs.)

111645 Surface finish measurements and surface characterizing parameters. J.Peters, P.Vanherck (Dept. of Mech. Engng., Katholieke Univ. Leuven, Heverlee, Belgium). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.99-108 vol.1 About 12 different surface characteristic parameters have been measured on 90 samples and computed by means of digital methods. A critical assessment shows the superiority of numerical methods above analogous ones and concludes to the necessity and the possibility to base the surface characterisation upon three major parameters. Recommendations are made for future standardisation and instrument design. (5 refs.)

111646 An investigation on capacitive methods for contact free surface measurement. W.Rimkus (Inst. fur Allgemeine Elektrotech., Tech Univ. Berlin, Berlin, Germany). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.109-14 vol.1 The present investigation on capacitive displacement sensors with high resolution shows, that by using a guard ring and integrating the sensor and the transducer electronics the measurement range can be considerably expanded. By using a sensor with an electrode diameter 2 $r=1$ mm and a displacement $d_0=100 \mu\text{m}$ a resolution less than 0.2 μm can be reached. The frequency encoded output signal makes this sensor advantageous to the use in digital processing. (4 refs.)

111647 Uncertainty of measurements made by laser interferometer. P.Boloni (Nat. Office of Measures, Budapest, Hungary). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.503-8 vol.2 Discusses the sources of uncertainties of length measurements made by laser interferometer. Effects and typical ranges of uncertainties are briefly discussed, as well as a simple method of calibration of laser interferometers. (3 refs.)

06.30E Mass and density measurement

111648 Measurement of the virtual mass of a circular cylinder placed in a resonance tube at a distance from its center. K.Matsuzawa, N.Inoue, T.Hasegawa (Dept. of Phys., Ehime Univ., Ehime, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1072 (June 1983). In previous papers, a method of measuring the inertia coefficient of a cylinder in a resonance tube (the ratio of the virtual mass of the cylinder to the mass of fluid displaced by the cylinder) and some experimental results were reported. In these studies, the cylinder was placed exactly at the center of the resonance tube so as to place it about the loop of the fundamental vibration. In the present paper, we describe an experiment in which the cylinder is placed at a small distance from the center. (4 refs.)

111649 Balances of power. *Lab. Pract. (GB)*, vol.32, no.8, p.40-8 (Aug. 1983). This comprehensive tabular survey of electronic balances is prefaced by a short article illustrating the power and versatility of these instruments in a wide range of environments. The table gives details on the performance of individual balances, together with information on special functions made possible by the electronics. (no refs.)

111650 Measurement philosophy for the calibration of a set of mass standards. M.Kochsiek, H.Kunzmann (Phys.-Tech. Bundesanstalt, Braunschweig, Germany). Technological and Methodological Advances in Measurement: Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.523-32 vol.2
The uncertainty of a mass linkup and for a decadic representation of a mass scale is calculated taking the uncertainty of the reference standard(s) into account. The optimum weighing schemes with column orthogonality lose their significance owing to correlation of measuring results. The mathematical details are not elaborated. (8 refs.)

06.30F Time and frequency measurement

(for astronomical aspects see 95.70)

111651 Reception and application of standard frequency- and time-signal emissions. P.Wirz (Zentralschweizerisches Tech. Luzern, Luzern, Switzerland).

Elektroniker (Switzerland), no.15-16, p.74-7 (10 Aug. 1983). In German.
A general description of the special receivers at the ZTL Institute at Lucerne, concerned with the processing of standard frequency and time signals, broadcast from the Swiss HBG transmitter in Prangins and the German source DCF 77 in Mainflingen, both based on caesium clocks in the 75.000... kHz range and holding to 10^{-12} of the nominal. Brief qualitative information is supplied on the aerials, receiver type (both 'straight' and superheterodyne), digitization of receiver readings and routine application for calibration both of precision-pendulum and quartz clocks. (no refs.) A.L.

111652 Analysis of small cesium beam tube. M.Kihara (Yokosuka Electrical Communication Lab., NTT, Yokosuka, Japan), H.Jumonji. *Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan)*, vol.J66B, no.7, p.916-23 (July 1983). In Japanese.

In the cesium beam frequency standard, frequency stability and longevity depend on the cesium beam tube. The authors present an analysis of the cesium beam tube operation and a method which simulates its operation. Assuming two-dimensional deflection, the method considers the tube component characteristics and layout which determine the tube performance. Because the Ramsey pattern is directly calculated by the simulation, the method is practical for the cesium beam tube design. Ramsey pattern shape parameters and velocity distribution obtained by the simulation are compared with experimental results. The data are generally consistent with the calculated results. (12 refs.)

111653 Electric-field measurements over a ground plane. R.Southwick (IBM General Products Div., Tucson, AZ, USA). *R.F. Des. (USA)*, vol.6, no.4, p.60-8 (July-Aug. 1983).

States that the imposition of FCC Regulation Part 15 Subpart J has generated renewed interest in measuring \vec{E} fields over a conducting ground plane, which is required by this regulation. The use of the E-field model described with an automated measurement system is a useful tool in the analysis of site attenuation. One advantage of this method is that sweep-frequency, site-attenuation and antenna-gain measurements can be easily made without either a standard antenna or a standard field. A second advantage is that a computer simulation using the given equation will provide a convenient method to analyze the effects of site geometry on measurement errors. (11 refs.)

06.50 DATA HANDLING AND COMPUTATION

(see also 02.70 Computational techniques; 29.80 Nuclear information processing; for optical data processing, storage and retrieval see 42.30; for geophysical data acquisition and storage see 93.65)

111654 The determination of X-ray spectra from attenuation data. I. The potentials of various methods. H.H.Kramer, H.von Seggern (Phys.-Tech. Bundesanstalt, Braunschweig, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.373-80 (1 Aug. 1983).

The value of the analysis of so-called ideal attenuation curves for obtaining X-ray spectral information is investigated. Various methods are critically examined. Limitations with respect to their accuracy, the maximum number of energy intervals and the useful energy range are presented for two absorber materials. The influence of various types of errors and uncertainties, which are associated with experimental attenuation data and its analysis, is quantitatively examined. This allows requirements as to the accuracy of the input data to be derived. (15 refs.)

111655 Interfacing a Unicam SP800 spectrophotometer to a microcomputer. M.G.Johnston (Dept. of Phys. Sci. & Technol., Polytech. of the South Bank, London, England). *Lab. Microcomput. (GB)*, vol.2, no.2, p.3-6 (1983).

A simple analogue-to-digital card and its operating software which were used to interface a Unicam SP800 ultraviolet spectrophotometer to an Apple II microcomputer are described. Although a specific application is cited, the technique is quite general and indeed the paper concentrates more on the technique of data accumulation rather than the details of the programming used for spectral analysis. The software required to actually read the digital

data from the converter card is minimal and is easily incorporated into a BASIC program using the PEEK and POKE commands. (1 ref.)

111656 System for acquisition, processing, and recording of experimental data using an 'Elektronika DZ-28' microcomputer. A.I.Fradkov, G.P.Zimin, O.A.Katsyuba (Kuibyshev Polytech. Inst., Kuibyshev, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.1, p.1363-8 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.47-52 (Nov.-Dec. 1982). [received: Sept. 1983]

A system is described that permits input of four analog signals with a timer code into a microcomputer, output of processed data to an analog two-coordinate PDP4-002 recorder and a 'Consul-260' alphanumeric printer, and which controls the experimental apparatus. The maximum interrogation rate on one channel is 1 kHz, and the minimum input signal amplitude is $10 \mu\text{V}$. Graphic data output is achieved to 0.1% precision. (4 refs.)

111657 Automated comparison of discrete spectra. P.N.Zaikin, M.V.Ufimtsev. *Moscow Univ. Comput. Math. & Cybern. (USA)*, no.4, p.22-9 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 15 (USSR)*, no.4, p.21-7 (1982). [received: Sept. 1983]

The problem of comparing two discrete spectra specified with different resolution is considered. A method of comparing one-dimensional and multidimensional spectra on the basis of a criterion is proposed. (6 refs.)

111658 Field data logger with EPROM storage. A.W.Robb, W.W.Nazaroff (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1252-3 (Sept. 1983).

A data logger using electrically programmable read-only memory for data storage is described. The storage capacity is sufficient to record measurements from eight instruments at 30-min intervals for almost ten days. This approach provides a moderately priced alternative to data loggers using magnetic tape or floppy disks when only modest data-storage capacity is needed. (4 refs.)

06.60 LABORATORY TECHNIQUES

111659 A novel sample preparation technique for cross-sectional TEM investigation of integrated circuits. J.Vanhellemont, H.Bender, C.Claeys, J.Van Landuyt, G.Declercq, S.Amelinckx, R.Van Overstraeten (Univ. Antwerpen, Antwerpen, Belgium). *Ultramicroscopy (Netherlands)*, vol.11, no.4, p.303-5 (1983).

A novel specimen preparation technique which allows cross-sectional TEM investigation of the structure, the geometry and the interfaces of the structures used for the production of integrated circuits is explained. By using a sawing technique no further mechanical thinning is required and one has the freedom to put the periodic structure in any direction on the surface. The same preparation technique also allows the study of the lattice defects at the interface and in the silicon substrate both by HVEM and HREM. (6 refs.)

111660 On the transfer function of an electromechanical transducer: an application to the Mossbauer velocity drive. P.Yadagiri Reddy, P.Narayan Reddy, C.Seshakumari, K.Rama Reddy (Dept. of Phys., Osmania Univ., Hyderabad, India). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.381-5 (1 Aug. 1983).

A mathematical model has been proposed for the design characterisation of velocity transducers used for Mossbauer drives. Analytical properties of the transfer function representing the dynamical behaviour reproduce all the aspects of empirical measurements. Transducers of symmetrical configuration

have been fabricated and the results of model calculations are verified. The transducer design parameters can thus be quantitatively specified for improving the velocity servo system stability and for fixing the higher mechanical resonance at the desired position with minimal effect on system stability. (14 refs.)

111661 RF-transducer for mechanical vibration. K.Kuroda, H.Hirakawa (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1005-8 (June 1983).

A RF-transducer for mechanical vibration is described. A small variable capacitance (~ 50 pF) works in a 1 MHz resonant circuit. A sensitivity of 4×10^{-14} m/ $\sqrt{\text{Hz}}$ is obtained which is limited by FM noise of the pumping oscillator. (10 refs.)

111662 A method of increasing the accuracy of an accelerometer. M.Mojzis.

Elektrotech. Cas. (Czechoslovakia), vol.34, no.6, p.451-2 (1983). In Slovak. An accelerometer employing an EM induction transducer is considered. The principle of the equipment is described and it is shown that by maintaining the linear dependency between the magnetic induction and the voltage at the inputs of the comparing elements of the equipment, the accuracy of the equipment can be increased. Measurement errors due to the nonlinearity of the equipment are evaluated. (1 ref.) E.D.

111663 Sensor for non-optical measuring quantities using optical principles and outputs. I. H.Hart (Sektion Elektronik, Humboldt-Univ. zu Berlin, Berlin, Germany).

Feingeräteechnik (Germany), vol.32, no.7, p.312-15 (1983). In German. Sensors with modulated light output and optical fibre coupling can be used in many applications. The various solution possibilities are discussed. (no refs.)

111664 The flat spring as a means for producing very small movements [electric sensor calibration]. P.Krischker, G.Thurn.

Feinwerktech. & Messtech. (Germany), vol.91, no.5, p.221-3 (July-Aug. 1983). In German.

The authors explain that the calibration of high resolution electric sensors for small displacements requires a means of producing displacements within the micrometre and nanometre ranges. The suitability of leaf springs is discussed and it is shown that if a force is applied to one side of a leaf spring set up as a cantilever, the displacement of the spring can be remarkably accurately determined by a law relating its displacement at the point of measurement to its total displacement at the extreme end. A required very small displacement can thus be determined by focussing a light beam at the required point on the beam and sensing in a second optical system the shape of the reflected spot. Besides discussing the factors affecting the resolving power of such a system, the author discusses the materials used, the construction of the meter and the results obtained. Some information on measurement errors is provided and it is concluded that this method is the most reliable for producing very small displacements. (2 refs.) G.W.

111665 Use of dielectric sensors in recording pressure pulses. V.V.Astanin, G.V.Stepanov.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.817-20 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.88-92 (Nov.-Dec. 1982). [received: Sept. 1983]

Dielectric pressure sensors are presently used by many researchers to record the profiles of pressure pulses in solids produced by shock or explosive loading. A lack of understanding of the physical principles of sensor operation and unique features of sensor application may be the cause of conflicting estimates of sensor capability and reports of unreliability of measurements performed with such sensors. The present authors review and present results from the latest studies performed on design and application of dielectric sensors for pressure pulse recording in solids. (8 refs.)

111666 Monolithic integrated sensors in I²L technique. H.J.Hwang, H.Reichl (ITF, Munchen, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.53-62 vol.1

Monolithic integrated frequency-analog pressure sensors were developed. For the application of I²L-ring oscillators in integrated sensors, different pressure-frequency conversion methods were investigated. The sensitivities and temperature coefficients of the fabricated pressure sensors were measured. (7 refs.)

111667 Thin film strain gauge pressure transducers for low-cost mass applications. K.Bethe (Tech. Univ. Braunschweig, Braunschweig, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.63-73 vol.1

Thin film strain gauges consist of an about 5 micron thick sandwich of an inorganic insulation layer, a strain-sensing resistive layer and a conductor layer, all these being vacuum deposited onto a metallic elastic element. Strain sensing can be accomplished by a ternary metal alloy or by polycrystalline semiconductor films of Si or Ge. Together with individually designed elastic elements, a whole family of mechanical sensors for pressure, force acceleration or flow can be built up. Low-cost fabrication can be realized by the exclusive use of sheet metal, which, being handled in 3'-slices, allows highly automated parallel processing of numerous sensors at once. Two principles of low-cost/low-precision pressure sensors are outlined covering the range of 0,1 to 500 bar. (no refs.)

111668 Very high resistance bonded foil strain gages. J.Dorsey (Micro-Measurements Div., Measurements Group Inc., Raleigh, NC, USA).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.125-31 vol.1

In the transducer and transmitter field the need for smaller bonded foil strain gages with higher resistance has led to work with semiconductor and deposited metal film sensors. Very small, high-resistance bonded foil gages have been developed with two important advantages over their devices: an extremely low temperature effect on zero, and the ability to compensate for loaded time effects in the transducer spring element. These new gages and their performance parameters are described. (no refs.)

111669 Sensors using strain gages. W.J.Ort (Hottinger Baldwin Messtechnik, GmbH, Darmstadt, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.151-6 vol.1

The authors presents a survey of strain sensitive materials and gives an evaluation of the different types. It is suggested that the best strain gage for precision sensor applications is a foil strain gage using a Ni-Cr alloy with special features like intrinsic compensation of thermal coefficient of Young's

modulus of spring materials used, integrated resistor networks for quick and easy zero balancing and calibration and integrated creep compensation techniques. Thin film strain gages may find more frequent use as their characteristics continue to improve. Some sensors developed for measurement of mechanical quantities using these technologies are introduced. (6 refs.)

111670 Methods of deflection and compensation applied to the pressure transducer. A comparative study. P.Krischker, T.Gast (Inst. fur Mess- und Regelungstechnik, Tech. Univ. Berlin, Berlin, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.163-7 vol.1

A comparative study of the methods of deflection and compensation will be made with a pressure transducer designed for the measurement of pressure differences from 0 to 500 μ bar (usable resolution is ca. 0.06 μ bar). It turned out that without exception the measurements carried out with the aid of the compensation method are better than those without compensation. This can be particularly observed in connection with the errors of linearity and hysteresis. By means of a volume open-loop control the compensation method offers the opportunity to eliminate the breathing of the diaphragm. (4 refs.)

111671 New devices for the static calibration of force transducers up to 10 N and for torque dynamometers up to 50 Nm. N.Fintinaru, I.Matkovits (Lab. Metrologie, Timisoara, Rumania).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.173-82 vol.1

The first device is aimed at the calibration of force transducers with a measuring margin of 10 N, using the technique of direct deadweight loading. Tensile or compressive loads can be applied in steps of 1 N each, in loading and unloading, with estimated accuracy being $5 \times 10^{-3} = 0.005\%$. The second device is used for the calibration of torque-dynamometers up to 50 Nm. Load steps of 5 Nm each are embodied by direct loading with the deadweights of a double-lever arm provided for positive or negative torques, both for loading and unloading. The overall accuracy ensured is $5 \times 10^{-4} = 0.05\%$. (16 refs.)

111672 An overview on integrated sensors. L.A.Murray (Electro-Optic Integrated Controls Inc., San Diego, CA, USA).

Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.19-0/1-5

Sensor for a host all determinant parameters (length, time pressure, temperature, voltage, etc.) and their rates of change can be selected from a wide range of disciplines, materials and technologies. However to address the various applications, the sensor output has to be fed into a silicon integrated circuit to prepare the signal for sensible employment. Because the IC is silicon and because many advantages accrue to integrating the sensor monolithically (cost, reduced size, relaxed sensitivity et al. specifications), silicon based sensors possess advantages over the other competing sensor technologies in meeting volume sales. The author examines the various sensor families and discusses some of the problems encountered in their integration. Finally, the developing integrated sensor markets are looked at. (no refs.)

111673 Integrated circuit sensors. H.Guckel (Dept. of Electrical & Computer Engng., Univ. of Wisconsin, Madison, WI, USA).

Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.19-3/1-2

Summary form only given. Viable integrated circuit-sensor technologies are typically the results of positive solutions to certain compatibility problems. Compatibility difficulties are traceable to two sources: interdisciplinary skills and associated misunderstandings, and, rigid IC-processing techniques. The author discusses the experiences at Wisconsin in developing ion sensor technology. The preliminary conclusion from this design effort include the realization that a modest building block library together with a suitable CAD technique provides the needed flexibility to handle most sensor inputs. Compatibility with sensor construction techniques is very difficult to achieve. Moreover, sensor tolerances cause problems for a general circuit design approach. Thus, sensor and system improvements are needed if commercial viability is to be achieved. (no refs.)

111674 Multimode optical fiber sensors. M.Brenci, R.Falciai, A.M.Scheggi (IROE, CNR, Firenze, Italy).

Alta Freq. (Italy), vol.52, no.3, p.206-8 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).

Fiber optic sensors utilizing induced changes in the transmission characteristics of an optical fiber are being used for different purposes. After a short review on the state of the art on sensors based on multimode fibers this contribution presents the scheme and measurements carried out on a temperature sensor where the transducer is constituted by a liquid which matches a very short section of an unclad multimode step index fiber. The refraction index variations of such a liquid give rise to amplitude variations at the exit of the fiber and depending on the type of liquid may allow the scanning of different temperature ranges which correspond to different fields of application. (14 refs.)

Experimental data are used in establishing the main reason for thermoelectric inhomogeneity: mechanical stresses in the thermoelectrodes which play the main part in distorting temperature measurement for multicomponent systems. (15 refs.)

111679 Principles of successful use of contactless thermometers. H.Roetschi.

Neue Tech. (Switzerland), vol.24, no.10, p.42-5 (Oct. 1982). In German.

The principles of temperature measurement via infrared energy per unit time are explained, with special attention paid to absorption (emission), reflection and transmission coefficients. The receiver must have an adjustment for its true emission factor, but the error of reading is much smaller than the misestimate of this factor. Metal surfaces present no transmission problems, glass needs an instrument which operates only above 3 μm , and plastics need instruments sensitive only to narrow bands around 3.5 and 7 μm . (no refs.) J.M.S.

111680 Stability of some cryogenic carbon resistance thermometers.

L.M.Besley (CSIRO Div. of Appl. Phys., Sydney, Australia).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1213-17 (Sept. 1983).

The stability of 12 commercial carbon resistance thermometers has been tested at three temperatures, 12.6, 20.3, and 30K, when the sensors were exposed to cycling between 12.6 and 293K. The resistances of the thermometers changed markedly over 20 such cycles by amounts equivalent to temperature changes of between 0.07 and 0.57K at 20.3K. Both abrupt and gradual changes were observed. A few measurements were made at 4.2K to explore the correlation between changes in resistance at various temperatures. A two-point recalibration method is shown to be accurate to 1 mK over the range 12.6 to 30K and can be used to 4.2K. (9 refs.)

07.20F Calorimetry

111681 A simple microcomputer-controlled calorimeter: the heat capacity of copper, Invar and RbNiCl₃ in the range 2-20K. S.J.Collocott (Div. of Appl. Phys., CSIRO, Lindfield, New South Wales, Australia).

Aust. J. Phys. (Australia), vol.36, no.4, p.573-81 (1983).

A simple inexpensive microcomputer has been used to control an adiabatic pulse-type calorimeter. The data acquisition control system incorporates a Rockwell AIM65 microcomputer to control all aspects of the thermometry and the injection of the heat pulse into the sample. Details of the hardware and software requirements are discussed, including the interface of the system with a host computer that uses the UNIX operating system. The performance of the apparatus was evaluated by measuring the heat capacity of 1965 Calorimetry Conference copper between 2 and 20K. The results show a total RMS deviation of less than 0.4% and agree well with the copper reference equation (RMS deviation 0.4%). Measurements are also presented of the heat capacity of Invar (Nilo 36) and RbNiCl₃ over the same temperature range. In the case of RbNiCl₃ the heat capacity anomaly associated with the paramagnetic-antiferromagnetic transition is observed at 11.1K. (21 refs.)

111682 An automated calorimeter for heat-capacity measurements from 5 to 300K. The heat capacity of cadmium sulfide from 5.37 to 301.8K and the relative enthalpy to 1103.4K. R.P.Beyer, M.J.Ferrante, R.V.Mrazek (Albany Res. Center, Bur. of Mines, US Dept. of the Interior, Albany, OR, USA).

J. Chem. Thermodyn. (GB), vol.15, no.9, p.827-34 (Sept. 1983).

An automated adiabatic calorimeter that operates over the range 5 to 300K is described. The heat capacity of cadmium sulfide, CdS, has been measured from 5.37 to 301.8K. A copper-block drop calorimeter was used to measure relative enthalpies to 1103.4K. The values at 298.15K for the molar quantities $C_{p,m}^{\circ}$, $\{S_m^{\circ}(T) - S_m^{\circ}(0)\}$, $-\{G_m^{\circ}(T) - H_m^{\circ}(0)\}/T$, and $\{H_m^{\circ}(T) - H_m^{\circ}(0)\}$, were found to be (47.29 \pm 0.03), (72.18 \pm 0.26), (39.31 \pm 0.33) J.K⁻¹.mol⁻¹, and (9802 \pm 19) J.mol⁻¹, respectively. These functions were calculated to 1100K. (13 refs.)

111683 A semi-micro rotating-bomb combustion calorimeter. R.M.Metzger, C.S.Kuo, E.S.Arafat (Dept. of Chem., Univ. of Mississippi, University, MS, USA).

J. Chem. Thermodyn. (GB), vol.15, no.9, p.841-51 (Sept. 1983).

A semi-micro rotating-bomb combustion calorimeter is described. It is designed on the model of the Bartlesville stirred-water system, but is built into a Parr 1243 adiabatic calorimeter. Quartz thermometers are used to measure temperature. The 29 cm³ bomb is platinum-lined, and requires 50 mg samples. The calorimeter constant is (4168.98 \pm 2.23) J.K⁻¹. For five crystalline substances studied previously the derived standard molar enthalpies of formation at 298.15K are $\Delta_f H_m^{\circ}$ (kJ.mol⁻¹): naphthalene, (87.17 \pm 1.53); anthracene, (125.54 \pm 5.59); 7,7,8,8-tetracyanoquinodimethane (TCNQ), (666.09 \pm 5.91); (1:1)-(N,N,N',N'-tetramethyl-p-phenylenediamine.TCNO), (624.10 \pm 8.63); and diphenyldisulfide, 151.06. (35 refs.)

111684 High-temperature calorimeter for the measurement of vapor pressure and enthalpy of vaporization. G.Natarajan, D.S.Viswanath (Dept. of Chem. Engng., Univ. of Missouri, Columbia, MO, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1175-9 (Sept. 1983).

An adiabatic calorimeter for the simultaneous measurement of enthalpies of vaporization and vapor pressures of certain coal chemicals is described. The calorimeter was tested using benzene for which accurate experimental data exists in the literature. Benzene is one of the substances recommended by IUPAC as a reference substance for calorimetric studies. The uncertainty in the benzene data is ± 5 J/mole in the temperature range of 350K (very close to the boiling point) to 480K (around 0.85 times the critical temperature). Both vapor pressure and enthalpies of vaporization of benzene showed excellent agreement with the available literature data. (27 refs.)

111685 AC calorimeter for liquid including suspension of biological materials. S.Imaizumi (Dept. of Phys., Suzuka Coll. of Technol., Suzuka, Japan), K.Suzuki, I.Hatta.

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1180-5 (Sept. 1983).

An AC calorimeter is developed for the measurement of heat capacity in liquid including the aqueous suspension of biological materials in the temperature range between 270 and 400K. Using this apparatus the authors performed the measurement of heat capacity at the main phase transition of lipid suspended in water. Additionally a new method to determine the absolute value of the heat capacity is proposed. (24 refs.)

111686 Thermometric and calorimetric methods in electrochemical and corrosion studies. A.T.Kuhn (Dept. of Biomaterials Sci., Eastman Dental Hospital, London, England), A.M.Shams El Din.

Surf. Technol. (Switzerland), vol.20, no.1, p.55-69 (Sept. 1983).

Calorimetric and thermometric techniques have been used sometimes to measure the electrochemical Peltier heat and sometimes to promote understanding of a reaction mechanism or of the nature of complexes from which metals are deposited. In what appears to be an entirely separate branch of study, the 'Mylus method' is used to monitor corrosion or the working of inhibitors by thermometric measurements. A review of the above work and a brief description of the instrumentation used, which ranges from a simple mercury-in-glass thermometer to microwatt calorimeters and thermistor measurement circuits detecting changes of 10⁻³°C or less, are given. (66 refs.)

111687 Rotational Raman interferometric measurement of flame temperatures. E.J.Burlaw, R.L.Armstrong (Phys. Dept., New Mexico State Univ., Las Cruces, NM, USA).

Appl. Opt. (USA), vol.22, no.18, p.2860-6 (15 Sept. 1983).

The rotational Raman scattered light from the nitrogen present in a flame is analyzed with a Fabry-Perot interferometer whose free spectral range is matched to the frequency separation of the Raman lines. The resulting interferograms are fit to theoretical interferograms using a least- χ^2 technique. Flame temperatures obtained from this analysis are compared to in situ thermocouple measurements with reasonable agreement. The measured temperatures are compared to other published data, and sources of error are discussed. (31 refs.)

111688 Unsteady method of measuring the thermal conductivity of gases at high temperatures. Yu.K.Vinogradov, N.I.Sidorov (S. Ordzhonikidze Moscow Aviation Inst., Moscow, USSR).

High Temp. (USA), vol.20, no.6, p.921-5 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1158-63 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors describe the theoretical basis of the monotonic heating method relevant to investigation of the thermal conductivity of gases where the heating rate of the measurement cell depends nonlinearly on the temperature. Theoretical relations are obtained for the thermal conductivity of gases, with corrections for nonlinearity of heating rate and nonuniformity of the temperature field. (3 refs.)

111689 Reactive scattering cell for atomic hydrogen and deuterium. J.T.Park, E.Redd, T.J.Kvale, E.Rille (Phys. Dept., Univ. of Missouri-Rolla, Rolla, MO, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1247-8 (Sept. 1983).

A design for a high-temperature reactive scattering cell for atomic hydrogen and atomic deuterium is described. At approximately 2700K a dissociation of the molecular target species of over 95% has been obtained. The lifetime of 340 h of operation is sufficient for precision, long-time, differential cross-section measurements. (7 refs.)

07.20M Cryogenics

111690 Sensors for cryogenic thermometry. W.G.Pierce, D.J.Bartos. *InTech (USA)*, vol.30, no.7, p.53-6 (July 1983).

Sensors for cryogenic temperature measurement include germanium and carbon-glass resistance, platinum and other metallic resistance, gallium arsenide and silicon diode, strontium titanate capacitance, and thermocouple devices. The elements offer different combinations of range, sensitivity, accuracy, immunity from magnetic field effects, and other properties. (16 refs.)

111691 Development of a pneumatically operated cryorefrigerator. K.G.Narayankhedkar (Dept. of Mech. Engng., Indian Inst. of Technol., Bombay, India).

Indian J. Cryog., vol.6, no.4, p.171-5 (1981).

A pneumatically operated Gifford McMahon cryorefrigerator has been successfully developed. Since the unit is pneumatically operated, it obviates the necessity of an electric motor, gearbox, etc. Air is used as the working substance. Temperatures down to 140K could be obtained under no load conditions using compressed air at 8 ata. The refrigerating capacity at 160K is about 2 watts with the inlet pressure of 8 ata. (4 refs.)

111692 A simple J-T system for testing small heat exchangers. G.Klip-ping (Dept. of Phys., Freie Univ. Berlin, Berlin, Germany), H.Walter, G.Ran-garajan, V.Sankaranarayanan, R.Srinivasan.

Indian J. Cryog., vol.6, no.4, p.176-83 (1981).

Describes a simple Joule-Thomson system to test small heat exchangers. Such heat exchangers are integral parts of cooling systems providing refrigeration of about a watt at 77K. The use of the system is illustrated with results of tests on two small heat exchangers. (2 refs.)

111693 Development of a cryostat for AC Josephson effect studies. V.S.Tomar, N.D.Kataria, M.Prasad, A.K.Gupta (Nat. Phys. Lab., New Delhi, India).

Indian J. Cryog., vol.8, no.1, p.9-12 (1983).

A cryostat is designed to facilitate mounting of Josephson junctions in the resonant RF field in order to study AC Josephson effects. The cryostat consists of a circular brass cap incorporating a stainless steel X-band waveguide welded with the cap at about 10 cm length. The lower end of the waveguide is connected to a junction holder with a moveable short arrangement. The junction holder is also made from a stainless steel waveguide and has a slot milled in its broad wall to facilitate the mounting of the Josephson junction. The short at the bottom of the sample holder can be moved from outside the cryostat using a stainless steel shaft gear arrangement. The moveable short arrangement helps in securing improved microwave coupling with the junctions and they require very low microwave power. Microwave induced steps are observed in *I-V* characteristics of both thin film tunnel junctions and solder-blob (SLUG) junctions. (11 refs.)

111694 Performance of the pneumatically operated Gifford-McMahon cryorefrigerator. P.H.Parmar, K.G.Narayankhedkar (Dept. of Mech. Engng., Indian Inst. of Technol., Bombay, India).

Indian J. Cryog., vol.8, no.1, p.64-6 (1983).

Presents performance details of the pneumatically operated Gifford-McMahon cryorefrigerator. Regenerator is one of the most important components of the cryorefrigerator which influences the performance of the unit. The valve mechanism should also satisfy the requirements of the cycle of operation. Use of the pneumatically operated valve block makes the unit compact. A no load temperature of 140K has been obtained using compressed air at 8 ata. The unit has a refrigerating capacity of 2 watts at 160K with the inlet pressure of 8 ata. (2 refs.)

07.25 HYGROMETRY

111695 Low power consumption solid state humidity sensor. K.Yuuki, T.Sakano, Y.Yokomizo (Marcon Electronic Co. Ltd., Yamagata, Japan).

IEEE Trans. Consum. Electron. (USA), vol.CE-29, no.3, p.305-9 (1983). (1983 IEEE International Conference on Consumer Electronics. ICCE, Des Plaines, IL, USA, 8-10 June 1983).

A new ceramic humidity sensor composed of ZnCr₂O₄-LiZnVO₄ was developed. This high reliability sensor has excellent stability in environments of air and corrosive gas atmospheres. An equivalent circuit of the sensor in the complex impedance method is represented by a parallel combination of resis-

tance and capacitance as a first approximation. The resistance changes linearly from 340 KΩ to 3.4 KΩ in 30 to 90% RH range at 25°C-120 Hz as a logarithmic function. (5 refs.)

111696 Absolute humidity measurement utilizing α-ray absorption. S.Matsumoto, H.Kobayashi (Lab. of Appl. Phys., Saitama Univ., Saitama, Japan).

Radioisotopes (Japan), vol.32, no.9, p.399-403 (Sept. 1983). Changes in the air density due to humidity were measured by a scintillation detector with α-particles. The distance between the scintillator and an α-ray source of ²⁴¹Am, 3.7 MBq (100 μCi), was fixed at 25 mm which was a little shorter than the range of α-particles from the source. The measured absolute humidities were in a range of 7.9 g/m³ to 52.2 g/m³ at temperatures of 35°C and 45°C and under atmospheric pressure. The counting rate of α-particles in an absolute humidity of 31.7 g/m³ (80% in relative humidity) at 35°C increased 28% compared with that in dry air. From experimental results and theoretical calculation, the counting rate difference between humid air and dry air was shown to be almost proportional to the absolute humidity in air. The absolute humidity can be measured with an accuracy of ±3 g/m³, that is ±5% in relative humidity at 45°C. (6 refs.)

111697 Improved X-ray collimation system for diamond-anvil high-pressure cells. D.Schiferl, B.Olinger, R.Livingston (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1250-1 (Sept. 1983).

An improved X-ray collimation system for diamond-anvil high-pressure cells is described. The usual practice of mounting the collimator directly in the diamond-anvil cell is not followed. Instead, the collimator is mounted and aligned in a fixture which can be removed from the diamond-anvil cell. The end of the collimator furthest from the sample can be fitted with a set of removable plugs, each with a different aperture. This collimation system is easily aligned, can be removed from the high-pressure cell with no loss of alignment, and is inexpensive to construct. (3 refs.)

111698 Measurement of the hydrostatic pressure by means of the manganin gauge up to 100 kbar. M.Nomura.

Solid State Phys. (Japan), vol.18, no.6, p.333-8 (June 1983). In Japanese.

The method to measure the hydrostatic pressure up to 100 kbar using the manganin pressure gauge is described. Its applications are also presented. (16 refs.)

111699 Mechanical analysis of 18ϕ piston-cylinder type high pressure apparatus by the finite element method. S.Tamura.

Solid State Phys. (Japan), vol.18, no.6, p.339-43 (June 1983). In Japanese.

Mechanical analysis of the piston, the pedestal of the piston and the cylinder were carried out. The reason why the pressure could be increased when the cylinder was end-loaded was clarified. (16 refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

111700 A new design and experimental testing of a carbon monoxide sensor. A.A.Al-Najar, A.M.Ibraheem (Dept. of Chem., Coll. of Education, Univ. of Basrah, Basrah, Iraq).

Iraqi J. Sci., vol.22, no.4, p.505-19 (1981). [received: Aug. 1983]

A new limiting current sensor for the determination of carbon monoxide at different ambient conditions is considered. The efficiency of this sensor based on electrochemical principles is critically dependent upon the relationship between the CO oxidation current and the electrode potential. The rapid changes of cell current to concentration change in CO, in air samples, suggests that the sensor could be developed further into a useful practical device. (13 refs.)

111701 Josephson-element voltage standards. L.Grimm, J.H.Hinken.

Elektronik (Germany), vol.32, no.13, p.105-8 (1 July 1983). In German.

Josephson effect physical principles where DC current in point contact or tunnel elements at superconducting temperatures is accompanied by alternating current with frequency related precisely to DC voltage through electron charge and Planck's constant, are described. Voltage standards synchronise the Josephson effect frequencies using injected microwave frequencies, with about 72 GHz corresponding to 150 μV applied DC. Typical millivolt DC levels are interpreted at 1 V level by bridge and resistive voltage divider methods. Practical cryo voltage standards and high accuracy performance, with Josephson element, waveguide, voltage divider and superconducting quantum interference device null detector all in liquid helium, are explained. (17 refs.) *H.V.H.*

111702 Instrumentation for the measurement of thermal expansion of materials at low temperatures. P.P.Krishnapur, S.V.Subramanyam, M.V.Lele (Indian Inst. of Sci., Bangalore, India).

Indian J. Cryog., vol.8, no.1, p.43-7 (1983).

A bath type cryostat incorporating the three terminal capacitance technique has been designed and fabricated for the measurement of thermal expansion of materials between 350K and 80K. With a slight modification in the arrangement of capacitor plates the cryostat can also be used conveniently to explore the dielectric properties of materials. The thermal expansion cell made purely with copper is the important part of this. The constructional details and performance characteristics of the cryostat are discussed. Since the method of measurement requires a Ratio Transformer impedance bridge having two inductive arms, and the other two three-terminal capacitors, the Ratio Transformer having six decades fabricated here has been used. The accuracy of comparison is 2 ppm. For standardisation of the cryostat, measurements have been made on high purity copper, TGS and KDP. The data have been found to agree with those of others. (12 refs.)

111703 Improved differential photocurrent method for measurement of optical-absorption coefficient and minority-carrier diffusion length in a semiconductor. S.Hasegawa (Graduate School of Electronic Sci. & Technol., Shizuoka, Univ., Hamamatsu, Japan), T.Watanabe, A.Tanaka, T.Sukegawa. *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1165-8 (Sept. 1983). This paper describes an improved differential photocurrent method of measurement of optical-absorption coefficient α and minority-carrier diffusion length L . A prototype instrument can detect signals of the photocurrent I_p , the differential photocurrent ΔI_p , and the depletion-layer width W of sample diode, and plot automatically two linear relationships: $\log(\Delta I_p/\Delta W)$ vs W and I_p vs $\Delta I_p/\Delta W$. From these plots, α and L are readily obtained. Performance of the instrument is demonstrated using a Au-GaAs_{0.62}P_{0.38} Schottky-barrier photodiode. (3 refs.)

111704 Pulse technique for measuring magnetoresistance of metals in high magnetic fields. P.Czarnecki, M.Surma (Inst. of Phys., A. Mickiewicz Univ., Poznan, Poland). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1202-4 (Sept. 1983). A method for measuring magnetoresistance of metals and metallic alloys in a pulse magnetic field of high intensity is presented. The accuracy of the sample magnetoresistance $\Delta\rho/\rho_0$ is $\pm 12\%$ and $\pm 5\%$ for $\Delta\rho/\rho_0$ values of 10^{-3} and 10^{-1} , respectively. This accuracy can be achieved for sample resistances of the order of 10^{-1} - $10^2\Omega$. (6 refs.)

111705 Drift reduction of the incident signal in time domain reflectometry. R.Chahine, T.K.Bose (Dept. de Phys., Univ. du Quebec a Trois-Rivieres, Quebec, Canada). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1243-6 (Sept. 1983). Modification of a 1811 A Hewlett-Packard time domain reflectometry (TDR) system is described for long-time drift reduction. Triggering methods for single-channel as well as dual-channel TDR systems are discussed. It is shown that the long-time drift of the 1024-point incident signal is reduced to less than one discrete point over a period of several hours. This modification extends the upper frequency limit of a TDR system to about 10 GHz for precision permittivity measurements. (14 refs.)

111706 Field-strength measuring probe for appraising the danger to man in the near-field of high-power radio transmitters. D.Hoff, K.-H.Turkner. *Rundfunktech. Mitt. (Germany)*, vol.27, no.4, p.171-8 (July-Aug. 1983). In German.

For the conception of a measuring method, values are derived for appraising the danger due to strong electromagnetic fields. It appears that, in general, all the field-strength components at the point of measurement must be taken into account. For application in the near-field of high-power radio transmitters in the LF, MF and HF bands, certain constraints, in particular regarding isotropy, bandwidth, dynamic, radiation resistance and facility of manipulation, must be made on a universally-applicable measuring installation. The article discusses the problems of development arising from those constraints; the solutions found give rise to a direct-indicating measuring installation which is suitable for practical application. (7 refs.)

111707 Methods and standard apparatus for reproduction and measurement of electrical signals of infrasonic frequencies. E.D.Koltik, S.A.Kravchenko, V.I.Fomenko (D.I. Mendeleev Res. Inst. of Metrol., Leningrad, USSR).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.311-14 vol.2

Presents new methods of designing precise apparatus for reproduction of electrical signals in the frequency range from 0.001 to 1000 Hz and their accurate measurement. It is shown that the apparatus reproduces two voltages of 10 V with an accuracy of 0.01%, the frequency instability being 10^{-3} when the phase angle is adjusted within 0 to 360° at discrete steps of 10° with an error of 0.05°. Voltage is measured with an accuracy of 0.03%, the phase shift measurement has a sensitivity of 0.01°. The harmonic factor is 0.07%. (4 refs.)

111708 A further development in error reduction models. R.Dearnley, A.Barel, J.Renneboog (Dienst voor Algemene Electriciteit, Vrije Univ. Brussel, Brussel, Belgium).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.315-20 vol.2

With the continual increase in computing capabilities and possibilities to use automatic measurement systems, a sixteen term error model was developed. Results are obtained from an automatic microwave measurement system which uses this model. A comparison is made with a twelve-term 'universal' model which has been used in the past. (4 refs.)

07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

111709 Dynamic range of a superconducting quantum magnetic-flux measuring instrument. A.V.Filimonov. *Meas. Tech. (USA)*, vol.25, no.11, p.961-3 (Nov. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.11, p.63-4 (Nov. 1982).

The results of measurements of the single-signal and two-signal dynamic range of a superconducting quantum instrument for measuring magnetic flux over a frequency band are presented. These results show that the dynamic range is mainly determined by the parameters of the integrator in the circuit. The values obtained for the dynamic range (~ 100 dB at a frequency of 20 Hz) can be used to estimate the dynamic possibilities of measuring instruments using superconducting quantum magnetic-flux measuring instruments. (4 refs.)

111710 Apparatus for measuring the magnetic susceptibility of a diamagnetic or paramagnetic material in the solid or molten state. L.V.Borodin, M.V.Smirnov, V.Ya.Kudakov. *Meas. Tech. (USA)*, vol.25, no.11, p.967-9 (Nov. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.11, p.66-7 (Nov. 1982).

The authors consider an apparatus for determining the magnetic susceptibility of a solid or molten substance, which has been used in systematic measurements on the susceptibilities of MeCl-FeCl₃ systems, where Me is K, Na, Rb, Cs. The apparatus consists of a magnet with shaped poletips, a balance placed

in a glass cover, and measurement and control apparatus. The balance enables one to make measurements on solid molten diamagnetic specimens of a specific susceptibility more than -2×10^{-8} cm³g⁻¹, and paramagnetic ones with susceptibilities not more than 4.0×10^{-3} cm³g⁻¹. (10 refs.)

111711 Apparatus for the measurement of the magnetic susceptibility of liquids in high magnetic fields. J.S.Brooks, G.O.Zimmerman (Boston Univ., Boston, MA, USA), R.Meservey. *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1234-7 (Sept. 1983).

The authors describe an apparatus capable of measuring the magnetic force on small liquid samples in high magnetic fields. The apparatus has been used to measure the magnetic susceptibility χ of liquid He at pressures up to 3 MPa in high magnetic fields and has a sensitivity in such measurements comparable to superconducting magnetometers in lower fields. The performance was tested by measuring the atomic diamagnetism of liquid ⁴He and liquid ³He as well as the nuclear paramagnetism of liquid ³He at 1.2 K in fields up to 15 T. (8 refs.)

111712 The VUZORT optical magnetometer. I.Soudek. *Sdelovaci Tech. (Czechoslovakia)*, vol.31, no.7, p.263-5 (July 1983). In Czech.

Describes the principle and realisation of an optical magnetometer based on the utilisation of the Kerr magneto-optical effect. The individual components of the system, i.e. the light sources, light polariser, optical system, radiation detector, a magnetisation circuit and the measuring circuits are outlined and the mechanical and functional solution of the system is described. The magnetometer is particularly suitable for measuring the properties of vapour deposited magnetic films on glass. For magneto-optical sensing of signals or for analogue sound recordings, several constructional modifications would be required. (9 refs.) E.D.

111713 Differential measuring instrument of magnetic characteristics. M.N.Mikheev, E.S.Gorkunov, A.V.Antonov, M.I.Shirobokov, V.V.Nikitin (Inst. of Metal Phys., Acad. of Sci., USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.12, p.982-4 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.62-5 (Dec. 1982). [received: Sept. 1983]

Describes the operating principle of the prototype of the instrument DIMKh-1. With the aid of a differential magnetic transducer the instrument makes it possible to compare magnetic fluxes in relation to a standard specimen in the region of saturation induction, remanent induction, and coercive force, and it can be used under production conditions for the nondestructive determination of the structural state of products, their phase composition, and for estimating the degree of porosity. (7 refs.)

111714 Widening the range of constant magnetic fields which can be measured with impedance-type ferroprobe transducers. A.G.Alekseev, E.I.Zenin, Yu.A.Kovyazin, B.V.Patramanskiy, P.A.Khalileev (Inst. of Metals Phys., Acad. of Sci., USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.12, p.991-5 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.71-5 (Dec. 1982). [received: Sept. 1983]

Impedance-type transducers for measuring magnetic fields with a wide measurement range in comparison with the existing transducers are examined. (2 refs.)

07.58 MAGNETIC RESONANCE SPECTROMETERS, AUXILIARY INSTRUMENTS AND TECHNIQUES

(see also 61.16N EPR and NMR determinations)

111715 Spin-pattern recognition in high-resolution proton NMR spectroscopy. M.H.Levitt, R.R.Ernst (Lab. fur Phys. Chem., Eidgenossische Tech. Hochschule, Zurich, Switzerland).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.119-23 (2 Sept. 1983).

Techniques are introduced for the recognition of specific spin patterns in complex overlapping proton NMR spectra. They are based on the efficient and selective excitation of high-order multiple quantum coherence in systems of specified coupling network topology, and allow the suppression of undesired spin patterns. (30 refs.)

111716 A wide-band power amplifier for a pulsed NQR spectrometer. A.S.Azhaganov, A.V.Danilov (Perm Univ., Perm, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1162-4 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.109-11 (Sept.-Oct. 1982). [received: Sept. 1983]

A description is given of an output power amplifier for a pulsed NQR spectrometer. The amplifier develops a pulse power of 2 kW at a load of 75 Ω in the frequency band 2-50 MHz with a nonuniformity of 3 dB. The power gain is 30 dB. (9 refs.)

111717 NMR relaxometer transducer with magnetic-field pulse gradient coil. V.A.Sevryugin, V.D.Skirda (Kazan State Univ., Kazan, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1165-7 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.112-13 (Sept.-Oct. 1982). [received: Sept. 1983]

The construction of an NMR relaxometer transducer with magnetic field pulse gradient coil is described, in which the distortion of the self-diffusion coefficient caused by mechanical vibration is eliminated. The combination of a transceiver coil and thermocouple enables the temperature-regulation properties of the transducer to be improved and increases the accuracy with which the temperature of the sample can be monitored, the preset temperature being maintained with an accuracy of $\pm 0.2^\circ\text{C}$ over the range -160°C to 200°C with a lengthwise temperature gradient of $\leq 0.1^\circ\text{C}/\text{cm}$. (4 refs.)

111718 Nuclear-resonance teslameter for use in superconducting solenoids. Yu.I.Kazantsev, S.V.Rypalev, G.K.Yagola. *Meas. Tech. (USA)*, vol.25, no.11, p.959-60 (Nov. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.11, p.62-3 (Nov. 1982).

A teslameter that implements the nuclear-magnetic resonance NMR method in flowing water (see *ibid.*, no.10, 1975), enables one to measure magnetic induction over a wide range for fields with considerable inhomogeneity, but the probe is of diameter ~ 25 mm and operates only at room temperature. The authors have devised a flowing-water teslameter which is suitable for measurements on superconducting solenoids at room temperature and in liquid helium. The probe described has the following features relative to those described previously: the flow channel lies along the axis, which enables one to reduce the transverse dimensions; thermal insulation is provided by the

evacuated cavity, which means measurements can be made in the range 4.2-300K. (5 refs.)

111719 NMR-spectroscopic investigation of the distribution of a constant magnetic field. K.L.Zakharov, Yu.S.Konstantinov, A.M.Smirnov (Dept. of VHF Radiophys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.37, no.5, p.98-101 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.85-8 (1982). The application of a variant of the sensitive-point method in studying the distribution of a constant magnetic field in the gap of a high-resolution NMR spectrometer is considered. A method of producing two sensitive points is developed and theoretically verified: a motionless point which is used for internal proton stabilization and point scanning over the investigated volume. The following-receiver method is used to derive the NMR signal from the scanning sensitive point. The experimental apparatus is described. (5 refs.)

111720 Fast, versatile, and inexpensive pulse sequence generator. G.A.Mohr, C.M.Edwards (Dept. of Phys., Washington Univ., St. Louis, MO, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1238-42 (Sept. 1983).

A fast, versatile, and inexpensive programmable digital pulse sequence generator (PSG) suitable for use in broadband pulsed NMR has been developed. Its features include 20 ns resolution of pulse duration, operation without direct computer supervision, and enough flexibility to produce essentially any pulse sequence. The architecture and construction of the PSG are discussed, and an example of its programming is presented. (11 refs.)

111721 Edge scan wave-front analyzer for low order aberrations. J.S.Nichols, D.C.Duneman (US Air Force Weapon Lab., Kirtland Air Force Base, NM, USA).

Appl. Opt. (USA), vol.22, no.18, p.2836-43 (15 Sept. 1983). The principles and concepts of a wave-front analyzer based on spot edge scanning techniques and rising and falling illuminance slope comparisons are reviewed. An analyzer implementing these techniques and designed to be used with an adaptive optics element for the real time correction of low order aberrations is described. An evaluation of the tilt output channels of the analyzer shows a linear operating range exceeding $\pm 500 \mu\text{rad}$, frequency response exceeding 250 Hz, and a noise equivalent tilt angle of $4 \mu\text{rad}$. For the focus and astigmatism channels, the analyzer output is linear over an $\sim 2.5\text{-}3\text{-}\mu\text{m}$ range of aberration input for a diffraction-limited (DL) spot. The instrument gain falls from $\sim 8.5 \text{ V}/\mu\text{m}$ for a $1\times\text{DL}$ spot to $\sim 4 \text{ V}/\mu\text{m}$ for a $6\times\text{DL}$ spot. The noise equivalent aberration increases from $0.025 \mu\text{m}$ for a $1\times\text{DL}$ spot to $\sim 0.05 \mu\text{m}$ for a $6\times\text{DL}$ spot. (7 refs.)

111722 Optimal post detection phase estimation for wavefront sensing. R.M.Gagliardi (Dept. of Electrical Engng., Univ. of Southern California, Los Angeles, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.34-41 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The use of optical heterodyne wavefront sensors (HWFS) to estimate and correct distorted optical beams is presently under consideration. The HWFS theoretically allows simultaneous measurements of the phase differences across the received beam. These phase estimates can then be used to phase correct the waveform, for example, by adjustment of segmented mirrors or by differential path length control. A perfect phase estimate and adjustment over the beamfront will bring the corrected wavefront into perfect phase alignment, producing an ideal phase coherent plane wave beam. Several forms of signal processing in order to make the phase measurements following the interferometer. Procedures for frequency locking the local heterodyning laser and for measuring the phase of the photo-detected wavefront samples are discussed. Signal processing models are derived from basic analyses of frequency control and phase estimation subsystems. These models are then used to suggest system design and predict performance. The models are then extended to parallel processors involving arrays of photodetectors which have direct application to the HWFS system. (2 refs.)

111723 Comparison of wavefront sensor configurations using optimal reconstruction and correction. E.P.Wallner (Itek Optical Systems, Itek Corp., Lexington, MA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.42-53 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Recent work on optimal reconstruction of wavefronts from slope measurements has developed methods based on more realistic models of sensor devices. These methods also resolve certain ambiguities present in earlier reconstruction methods. The author applies these methods to sensor configurations which have been proposed in the literature and compares the errors involved in estimating and correcting the wavefronts. (9 refs.)

111724 Fundamentals of wavefront sensing by phase retrieval. R.A.Gonsalves (EIKONIX Corp., Bedford, MA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.56-65 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Phase retrieval implies extraction of the phase of a complex signal from its modulus. In the context of wavefront sensing, the unknown wavefront is represented as a phase across an aperture and the observable is the modulus of the diffracted light, measured in a convenient image plane. The author gives a concise statement of the problem, reviews some proposed solutions, discusses the question of uniqueness, gives elementary examples of phase retrieval, and shows how the concept might be used in an imaging context. (15 refs.)

111725 Fundamental performance limitations for the phase retrieval problem. S.R.Robinson (Radar & Optics Div., Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.66-70 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Precomputable (Cramer-Rao) lower bounds for the integrated mean-square error are presented for the phase retrieval problem. The results are based

upon the assumption that the phase is a sample function of a Gaussian random process and that the intensity measurements include additive white Gaussian noise. The bound, which is obtained from an information kernel which is the solution to a Fredholm integral equation, clearly demonstrates the effect of prior statistics, measurement noise and the nature of the linear transformation introduced prior to detection. Several examples are given; in particular, the role of diffraction is shown to be quite important for successful phase retrieval. Finally, the results are extended to include independent measurements of intensity in several planes. (6 refs.)

111726 Phase retrieval by optical phase differentiation. J.C.Bortz, B.J.Thompson (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.71-9 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

A phase retrieval technique utilizing a differentiation filter in a coherent processing system has been developed and tested. The image irradiance produced in this system is quadratic in the partial derivative of object phase with respect to an object coordinate parallel to the transmittance gradient of the filter. Given a properly chosen set of such image irradiances it is possible to solve for the object phase. (2 refs.)

111727 Role of diffraction in phase retrieval from intensity measurements. J.T.Foley, M.A.Abdul Jalil (Dept. of Phys., Mississippi State Univ., Mississippi State, MS, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.80-9 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The role played by diffraction in the question of the uniqueness of phase retrieval from intensity measurements in the aperture plane and focal plane of a thin lens is investigated. It is shown for a specific example that diffraction from the lens aperture stop reduces the nonuniqueness which is present if this diffraction is ignored. (13 refs.)

111728 Linear methods in phase retrieval. B.Ellerbroek, D.Morrison (Hughes Aircraft Co., El Segundo, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.90-5 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

On-orbit wavefront sensing and active alignment control are essential features of many spaceborne optical systems currently being developed. Phase retrieval is an especially appropriate wavefront sensing technique for this application, because it directly monitors system image quality and eliminates or reduces the need for auxiliary wavefront sensors. Although the general phase retrieval problem is highly complex and requires sophisticated nonlinear estimation techniques, properly selected linear methods provide satisfactory and efficient solutions to a number of important special cases. The authors discuss the performance of several such linear phase retrieval algorithms. One method yields noise-optimal estimates of small wavefront errors, while a second approach can be used with arbitrarily large errors but is much more sensitive to noise. These two phase retrieval algorithms are actually special cases of a general linear algorithm that can be tuned as a function of wavefront error characteristics, measurement noise statistics, and focal plane detector geometry. (5 refs.)

111729 Wavefront sensors for turbulence correction. D.W.Hanson (Rome Air Dev. Center, Griffiss AFB, NY, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.104-7 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Adaptive optics is gaining acceptance as a method of reducing the degrading effects imposed on optical signals by atmospheric turbulence. One of the critical components of an adaptive optical system is the wavefront sensor, the device which measures the aberrations on the wavefront. The wavefront sensor specifications depend on the mission for which the adaptive optical system will be used and the conditions under which it will operate. Typical missions and operating conditions in which adaptive optics can be used are presented. The error sources in a wavefront sensor are discussed in relation to mission and operating conditions. Desirable properties of wavefront sensors are also presented. (1 ref.)

111730 Linear-scanned-array (LSA) outgoing wavefront sensor. N.Bareket (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.115-20 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The linear-scanned-array wavefront sensor extends the applicability of imaging centroid trackers to Hartmann-type outgoing wave beam-control systems. Oscillating mirrors are used to produce optical integration of the irradiance distribution along one axis while the centroid is measured along the orthogonal axis. The use of linear detector arrays reduces the total detector-element count and increases the measurement bandwidth in comparison to area array sensors. Experiments with a four-beam laboratory model of the sensor have demonstrated centroiding of $150\text{-}\mu\text{m}$ diameter Hartmann spots to an accuracy of better than $0.6 \mu\text{m}$ at 4-kHz bandwidth. Optimal thresholding can improve the measurement accuracy considerably. The linearity of the sensor was measured to be better than $0.2 \mu\text{m}$ over an $80\text{-}\mu\text{m}$ range. (4 refs.)

111731 Experimental verification of an image-based alignment technique for optical systems in space. N.Wu, B.L.Ellerbroek, S.G.Williams (Hughes Aircraft Co., Culver City, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.121-30 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The authors have developed two alignment techniques for optical systems in space, i.e. OYSTER and EEOD. The OYSTER technique is based on wavefront slope. The EEOD technique is based on a star image. The authors discuss the basic algorithms used and the experimental results obtained. (2 refs.)

111732 Use of the superheterodyne wavefront analyzer for ground-to-space power transfer. N.A.Massie (Western Res., San Diego, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.132-40 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Transfer of optical power from ground-to-space at short wavelengths requires an adaptive wavefront corrector and a sensitive wavefront analyzer. In the several applications envisioned, coherent radiation from a laser beacon or retroreflector and ground based illuminator will be available for wavefront sensing. The superheterodyne wavefront analyzer can therefore be employed for performance approaching the quantum limit. The basics of the superheterodyne approach are discussed and its performance as a wavefront analyzer reviewed. (6 refs.)

111733 Point image focus sensing using an automated Foucault test. D.G.Kocher (Lincoln Lab., MIT, Lexington, MA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.148-54 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

An electromechanical focus sensing technique for isolated point or small spot images is described. The technique is a mechanisation of the Foucault knife-edge test, and it works with either laser or white light. The focus sensor provides an output voltage vs. focus discriminant which is linear in the vicinity of the best focus and monotonic over a wide range, making it suitable as a sensor for servo focus control applications. The focus sensor uses a chopping wheel at the optical focus and a field lens and bicell photodetector behind the focus. The relative phase of the zero-crossings of the AC-coupled bicell signals is detected electronically to obtain the voltage vs. focus discriminant. Two electronic detection algorithms are described and discriminants obtained with them in a typical implementation of the technique are presented. Also described are two techniques that have been used to compensate the detector signals for rapid fluctuations in the source intensity, if the fluctuations are rapid enough to interfere with the phase detection process. This focus sensing technique is sensitive primarily to focus, but some sensitivity to certain other wavefront aberrations also exists. These sensitivities have been computed for two particular cases, the resolved spot source (with a geometrical analysis) and the unresolved point source (with a diffraction analysis). These results are tabulated for the Zernike aberrations up to $m=n=8$. (3 refs.)

111734 Resonator technique for absolute reflection and transmission measurements. M.A.Bukhshtab. *J. Appl. Spectrosc. (USA)*, vol.37, no.5, p.1330-5 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.852-9 (Nov. 1982). [received: Sept. 1983]

The author considers the possibility of making measurements of the absolute value of the specular reflection (transmission) coefficient close to 1.000 with an error better than 0.001-0.002 in the case of normal incidence of light at some given point of a sample under inspection. The main requirement to the new technique is that no standards should be needed so that a dependence upon the storage conditions of the standards and measurements of even greater accuracy cannot affect the results. 111735 Evaluation and optimization by colorimetry of polarizers for liquid crystal display. R.Mizoguchi, K.Kobayashi (Sanritsu Electric Co. Ltd., Tokyo, Japan), T.Shimomura, S.Kobayashi.

Disp. Technol. & Appl. (GB), vol.4, no.4, p.201-6 (Oct. 1983). Describes the development of useful polarizers for LCD application, their optimization and evaluation based on colorimetry. Figures of merit are suggested for the characterization of LCDs and polarizers using this technique. More than 50 polarizers were used in the experiment, which also evaluated their use for both twisted nematic black-and-white LCDs and guest-host colour LCDs. Their optical properties and the associated display legibility were shown to be best expressed colorimetrically. (18 refs.)

111736 Conditions under which Schrodinger object colors are optimal. G.West (Ziegler-Instruments GmbH, Monchengladbach, Germany), M.H.Brill.

J. Opt. Soc. Am. (USA), vol.73, no.9, p.1223-5 (Sept. 1983). Schrodinger colors are optimal if and only if the spectrum locus in a chromaticity diagram in convex and well ordered in wavelength. The human spectrum locus has this property, but the bee spectrum locus does not. A general algorithm is described for generating the optimal colors for any tristimulus space. (8 refs.)

111737 Statistical analysis of measurement results obtained by pulse laser electron photometry methods. B.P.Klim, R.F.Fedorov.

Otbor & Peredacha Inf. (USSR), no.67, p.20-2 (1983). In Russian. Investigates the statistical properties of a pulse of light, containing measured information after conversion into electrical signals by a photomultiplier. Analytical expressions are derived for the mathematical expectation of the number of the electrons in the output pulse of the photomultiplier, and for the relative statistical error. The accuracy of a numerical estimation of the mathematical expectation of the photons in the light pulse is dependent on results of measurements of the number of the electron in the output pulse. (4 refs.) Z.F.V.

07.60F Polarimetry and ellipsometry

111738 Polarimetric strain gauges using high birefringence fibre. M.P.Varnham, A.J.Barlow, D.N.Payne, K.Okamoto (Dept. of Electronics, Univ. of Southampton, Southampton, England).

Electron. Lett. (GB), vol.19, no.17, p.699-700 (18 Aug. 1983). When a highly-birefringent fibre is stretched, the birefringence changes. The phenomenon is shown to result from a difference in Poisson's ratio of the two glasses from which the fibre is constructed. Experimental verification is given and a simple polarimetric strain gauge made from bow-tie fibre is demonstrated. (9 refs.)

111739 Spectroscopic ellipsometry. M.-H.Debroux, P.Ged, A.Vareille (CNET, Issy-les-Moulineaux, France).

Echo Rech. (France), no.113, p.61-8 (1983). In French. In silicon microelectronics, the characterization of thin film materials and their interfaces requires analysis tools featuring a depth resolution of about 50 Å. Spectroscopic ellipsometry techniques respond to certain demands such as this, with the added advantage of being non-destructive. Following a brief description of the formalities and tools used in the handling of a polarized light ray, several examples of analysis are given: silicon surface states, oxide thin film, Si-SiO₂ interfaces, implanted silicon. (no refs.)

111740 Recording linear dichroism spectra with the Spectropol-1 spectropolarimeter. A.S.Prishchepov (Phys. Inst., Acad. of Sci., Minsk, Belorussian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1464-6 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.134-6 (Nov.-Dec. 1982).

A method is proposed for measuring the linear dichroism of a weakly anisotropic liquid for a solid polymer using the Spectropol 1 spectropolarimeter provided that the linear birefringence is zero or small. Examples are given of measurements on linear-dichroism spectra for solutions of an aggregated pigment partially ordered by the Earth's gravitational field and also for polymer matrices activated by a dye, where the accuracy is 6×10^{-3} optical-density units. (2 refs.)

111741 A simple optical electron polarimeter. T.J.Gay (J.W. Gibbs Lab., Yale Univ., New Haven, CT, USA).

J. Phys. B (GB), vol.16, no.18, p.L553-6 (28 Sept. 1983). It is pointed out that heavy atoms (i.e. those which have spectroscopically resolvable fine structure) are not required for optical measurements of electron polarisation. A polarimeter which uses helium gas instead of heavy-metal vapour is proposed, and several experimental details are discussed. (15 refs.)

111742 Linear and circular polarisation modulation for measuring complex magneto-optical rotation. I. Principles and performance. J.Metzdorf (Inst. für Halbleiterphys. und Optik und Hochmagnetfeldanlage, Tech. Univ. Braunschweig, Braunschweig, Germany).

Optik (Germany), vol.65, no.2, p.103-13 (1983). In German. A dual-purpose polarization modulation method for the measurement of both magneto-optical rotation and ellipticity without a change of the calibration factor is described and discussed. As a polarization modulator a vibrating halfshade polarizer has been developed which allows continuous recording of both the complementary spectra. (32 refs.)

07.60H Refractometry and reflectometry

111743 A new type of receiver for optical time-domain reflectometry. P.Bassi, M.Zoboli (Dipartimento di Elettronica Informatica e Sistemistica, Univ. di Bologna, Bologna, Italy), A.Ragni, C.G.Someda.

Alta Freq. (Italy), vol.52, no.3, p.200-2 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).

A new receiver has been envisaged, designed and tested for OTDR. Its key feature is the use of an integrate-and-dump front-end section. The resulting equivalent noise bandwidth is such that a p-i-n photodiode can be conveniently used as a photodetector. The resulting instrument is simple, potentially inexpensive and rugged; therefore it looks attractive for applications in the field. Experimental results of laboratory tests are reported. (4 refs.)

111744 Quantitative shadow method for measuring a one-dimensional refractive index distribution. R.W.Lewis (Phys. Dept., GM Res. Labs., Warren, MI, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.155-63 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

A quantitative shadow method was developed and tested by measuring the one-dimensional refractive index distribution of a polished slab of gradient index glass. Tests made on the known glass sample showed that a one-dimensional index distribution can be measured by shadowgraphy to better than one percent accuracy. The method uses simple optics and can easily be automated to perform rapid measurements. Extension of the shadow method to more general distributions requires making many traverses of the refractive index distribution with a narrow sheet of light. (13 refs.)

111745 The resolving power of a reflectometer with compensation of background reflections. V.V.Moiseyev, V.T.Potapov, V.A.Sviridov, A.A.Sokolovskiy.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.10, p.68-9 (Oct. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.10, p.29-30 (Oct. 1982). [received: Sept. 1983]

Discusses some characteristics of the design of fiber-optic sensors which operate on the 'reflection' principle. The variation of the optical characteristics of the medium which surrounds the end of a fiber changes the signal reflected from the fiber end. The values of this signal depends on the external perturbation and is registered by a measuring photoreceiver (PR). The extraction of the useful signal in such a sensor is usually a problem if no special measures are taken for the optical compensation of the signal caused by Fresnel reflection from the fiber end because the useful signal level is normally much lower than the background level, caused by the initial Fresnel reflection. (1 ref.)

111746 Refractive index measurement using an optical fiber. I.Sankawa, N.Kashima, T.Satake, S.Sumida (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan)*, vol. J66C, no. 7, p.535-6 (July 1983). In Japanese.
Refractive index measurement using step-index optical fiber as a sensor is investigated. A flat fiber end-face is found to be needed for small measurement errors. Refractive index in the high temperature region and its distribution can be easily measured by this method. (4 refs.)

07.60L Interferometry

111747 Fringe pattern recognition and interpolation using nonlinear regression analysis. J.B.Schemm, C.M.Vest (Dept. of Mech. Engng. & Appl. Mech., Univ. of Michigan, Ann Arbor, MI, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2850-3 (15 Sept. 1983).
Least-square error criteria are used to fit 1-D interference fringe pattern irradiance data to a physically meaningful function of the form $I(x) = B(x) + E(x) \cos[P(x)]$, where $B(x)$, $E(x)$, and $P(x)$ are low-order polynomials. This procedure is intended to complement digital fringe recognition by providing a method for smoothing and interpolating among fringe position data when the number of fringes is small, there are more than ten irradiance measurements per fringe, and accurate phase values are needed at arbitrary locations in the field. (8 refs.)

111748 Analysis of two-beam interferometry for bulk wave measurements. H.M.South, C.H.Palmer (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2854-9 (15 Sept. 1983).

The application of differential interferometry to bulk wave measurements can be analyzed using the kinematic formulation of the photoelastic effect. For isotropic linearly elastic materials a standing longitudinal wave changes the indicatrix from a sphere to an ellipsoid revolution with axes parallel and perpendicular to the direction of propagation of the acoustic wave. If the probing light is linearly polarized, differential interferometry produces a maximum signal when the polarization of the light is perpendicular to the direction of propagation. This prediction is confirmed by experiment. The case of standing transverse waves can be analyzed in a similar manner. (17 refs.)

111749 Polynomial fit of subaperture interferograms. C.J.Kim (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.28-33 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

A method of obtaining surface figure error information from several subaperture interferograms is analyzed, and the effects of roundoff error, digitization error and fit error are presented. A computer simulation for testing a large flat is shown. This method is applied to average several undersampled interferograms and to analyze lateral shearing interferograms. (4 refs.)

111750 Self-referencing wavefront sensor. K.Underwood, J.C.Wyant, C.I.Koliopoulos (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.108-14 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

A modified Smartt point-diffraction interferometer employing phase-shifting electronic phase measurement techniques is described. Special techniques making it possible for the interferometer to give good visibility interference fringes for a large range of input wavefront tilts are discussed. A trade-off between acceptable values of wavefront tilt and light efficiency is presented. (5 refs.)

111751 Flow field testing with a 64 parallel channel heterodyne interferometer. N.A.Massie (Western Res., San Diego, CA, USA), D.M.Swain, M.R.Dunn, S.E.Muenter. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.141-7 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

A sensor system capable of simultaneously measuring phase at 64 discrete points has been developed for use with the digital heterodyne interferometer. With this, two dimensional optical path difference maps of high speed phenomena can be obtained. Featured in this system are 64 channels of phase detection with each channel being provided with a dedicated memory 16 bits wide and 4096 words deep. The system operates at a 100 kHz sample rate and has a sensitivity of 1/300 of a wave RMS. A novel method of post priori removal of the corrupting motions of the interferometer optics was demonstrated, allowing high fidelity measurements to be obtained in an unstabilized environment. (6 refs.)

111752 TV based system for interferogram analysis. K.G.Birch, K.Jackson, D.J.Pugh, P.D.West (NPL, Teddington, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.186-93 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Describes the use of a TV based system to measure the position of fringes in the interferograms of OTF standard lenses, as formed in a Twyman-Green interferometer. The core of the system is the transfer, under computer control, of sampled image signals from the TV to the buffer store of a desk-top computer. Data recovered from this memory is then analysed to determine the exact position of fringes within the interferogram pupil. Details of the computer subroutines used to evaluate fringe positions and to automatically renumber the fringes are followed by a brief description of data fitting routines used to derive aberration polynomials and thence the lens Optical Transfer Function. (5 refs.)

111753 Interferometer detection system for optical testing. D.S.Brown (NEI Grubb Parsons, Newcastle upon Tyne, England), M.J.Smyth. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.194-8 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The production of large precise optical components is usually a cyclical process of measurement and optical working which is repeated many times before the desired accuracy is achieved. The precision of testing limits the accuracy attainable in manufacture and reduces the efficiency of production cycles if the residual errors are comparable in size with the error of testing. To minimise cost it is important that the test equipment should be able to provide an adequate description of the errors in the system under test in a fairly small fraction of the total cycle time. Wavefront shearing interferometry is one of the test methods that has been effective in the past, but its efficiency has been limited by the data recording methods employed. Desirable improvements are: firstly, the ability to handle a larger volume of data,

secondly, reduction in testing time and finally, improved precision of phase measurement. The substitution of a detector which can be interfaced directly with a computer and the adoption of a scanning mode of operation should allow all three of these objectives to be achieved. (2 refs.)

111754 Advances in optical metrology of complex objects. C.Wykes (Dept. of Mech. Engng., Loughborough Univ. of Technol., Loughborough, England), R.Jones. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.200-5 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

It has been shown previously that Electronic Speckle Pattern Interferometry can be used to compare the shape of nominally identical components. The authors for calibrating the measurements and for converting the fringe data to surface shape information are discussed here and the accuracy of the measurements has been established. (5 refs.)

111755 Twyman Green interferometer with curved mirrors. M.V.R.K.Murty, R.P.Shukla (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.432-3 (July 1983).

Twyman Green interferometer with curved mirrors is described. It is found that the end mirrors in the Twyman Green interferometer need not be necessarily plane but must be identical in figure. (1 ref.)

111756 A real-time active vibration controller [for Michelson interferometry]. M.R.Serbyn, W.B.Penzes (Center for Mfg. Engng., NBS, Boulder, CO, USA). *ISA Trans. (USA)*, vol.21, no.3, p.55-9 (1982).

The Michelson interferometer is viewed as a noisy system whose noise input results from unwanted changes in the optical path lengths of its beams, and whose desired output is a constant optical path-length difference. A technique for maintaining this quality at a value equal to a multiple of a quarter wavelength of the light is described. (5 refs.)

111757 Contribution to the automatic fringe analysis using Zernike polynomials. F.M.Kuchel, T.Schneider, H.J.Tiziani (Inst. fur Tech. Optik, Univ. Stuttgart, Stuttgart, Germany).

Optik (Germany), vol.65, no.2, p.123-42 (1983). In German.
When measuring wavefront differences in two-beam interferometers the distribution problem of the sampling points arises. The mean square of the coefficients of a Zernike polynomial fit is strongly influenced by the number and location of sampling points. Wavefronts with big gradients demand high density of sampling point distribution. A combination of local and global interpolation is proposed, where the coefficients are determined with high precision and short computing time. (17 refs.)

111758 Theory of Fabry-Perot interferometer with statistically rough mirrors. I.V.Bogatyreva, V.P.Danil'chenko, L.A.Pospelov ('Metrologiya' Sci.-Industrial Assoc., USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.49-54 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.58-63 (Jan. 1983). [received: Sept. 1983]

Results of a theoretical study are presented pertaining to the effect of statistical roughness of mirror surfaces in a Fabry-Perot interferometer on the amplitude-frequency characteristics of H-polarized electromagnetic fields excited in it. (4 refs.)

111759 Optical amplitude and polarization multistability in a nonlinear interferometer. I.P.Areshnev, V.K.Subashiev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.588-9 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1368-72 (Nov. 1982). [received: Sept. 1983]

Discusses a polarizational optical bistability in a nonlinear medium for the case in which the nonlinear increment in the electrical induction is comparable to the linear component. The authors examine the steady-state transmission of arbitrarily polarized monochromatic light by a nonlinear ring interferometer filled with an isotropic medium exhibiting a cubic nonlinearity. They take into account the change in the nature of the polarization of the light as it passes through the interferometer. They discuss in detail the case of linearly polarized incident light. They show that there is a pronounced polarizational multistability here, while the amplitude bistability acquires some completely new features. The hysteresis loop turns out to be complex. (7 refs.)

07.60P Optical microscopy

111760 Applications of scanning optical microscopy. C.J.R.Sheppard (Dept. of Engng. Sci., Univ. of Oxford, Oxford, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.88-95 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). The scanning optical microscope (SOM) provides new information concerning a wide range of specimens. It is particularly advantageous for study of materials and devices, including semiconductors. The image is built up on a TV-type display by mechanically scanning the object across a focused laser spot. (21 refs.)

111761 Advances in the infrared microscopy of electronic materials. C.R.Elliott, J.C.Regnauld (British Telecom Res. Labs., Martlesham Heath, Ipswich, England), B.T.Meggitt. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.96-103 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). Crystalline semiconductor materials often contain structural defects which can influence adversely both the behaviour during processing and the ultimate performance of devices fabricated from them. Traditionally structural perfection has been assessed by the optical microscopy of chemically etched surfaces and augmented by X-ray and electron microscopic techniques when detailed analyses are required. Polarised infrared microscopy (PIM) is emerging as a non-destructive technique for the real time imaging of defects ranging in size from locally strained regions several millimetres across, down to single dislocations. The authors discuss the present state of PIM development, with examples taken principally from the field of opto-electronic materials. The performance of a polarizing microscope operating at near-infrared wavelengths is described for three distinctive imaging modes. In these modes, defects which absorb the illumination or cause stress birefringence or non-radiative carrier recombination in photoluminescent materials respectively are revealed with an optimum resolution of about 1 μm . (20 refs.)

111762 Holography applied to stereomicroscopy. R.W.Smith, T.R.Empson (Blackett Lab., Imperial Coll. London, London, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.104-9 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). The application of holography to microscopy is outlined with special reference to the identification of fossil ostracods using a stereomicroscope. The effect of laser speckle on the image quality is demonstrated and a speckle reduction technique based on the incoherent superposition of many differently-speckled reconstructions of the same object is discussed. A holographic attachment for a standard stereomicroscope is described in which this speckle reduction technique is implemented by means of a holographic lens array, and results are shown. (7 refs.)

111763 Interference film microscopy for metal phase identification. K.W.Raine, P.N.Quested (NPL, Teddington, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.110-18 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). Constituents in metal alloys and rocks may be seen as different colours using interference film microscopy. The thin films which produce the interference colours may be deposited either by vacuum evaporation or reactive sputtering. The technique is used in a wide range of investigations which require identification of phases quickly and easily, e.g. in nickel-base superalloys and hard metals. The theory, techniques for optimising the performance and a method of quantifying the results by microspectrophotometry discussed and a case study presented. (10 refs.)

111764 Particle size analysis by automated optical microscopy. L.C.Kenny, A.P.Rood (Health & Safety Executive, London, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.119-23 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). Recent developments in technology have led to the wide availability of image analysis systems suitable for particle size analysis, and one such system is described. Image analysis offers a significant advantage over manual microscopy as it allows large numbers of particles to be measured consistently and accurately. The image presented to the image analyser must be carefully prepared in order to reduce measurement errors to a minimum. Good sample preparation techniques are much more important here than for manual microscopy, and the greatest care must be taken when setting up the microscope/TV camera imaging system. Many more measurements can be made on each particle than would be possible manually, and several methods of calculating the particle size are described. The use of automated focus, slide transport and slide changing mechanisms under the control of the image analyser can eliminate the need for manual intervention in the system, allowing it to be run overnight. (no refs.)

111765 Reflex microscope: measurement in three dimensions. P.J.Scott (Dept. of Photogrammetry & Surveying, Univ. Coll. London, London, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.368, p.124-8 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982). A new three dimensional measuring instrument is described which uses a stereoscopic microscope. Objects of up to 100 \times 100 \times 60 mm can be measured without physical contact, with repeatability spreads of 20 μm . Proposed improvements are described which could reduce the spreads to 10 μm . (1 ref.)

07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

111766 Silicon photodiode device with 100% external quantum efficiency. E.F.Zalewski (US NBS, Washington, DC, USA), C.R.Duda. *Appl. Opt. (USA)*, vol.22, no.18, p.2867-73 (15 Sept. 1983). A device utilizing four inversion layer photodiodes in a light-trapping arrangement was constructed and tested. The device was found to have a photon-to-electron conversion efficiency of 0.999 for short wavelength and low power visible radiation. It was found that applying a reverse bias voltage extended the high quantum efficiency response over the entire visible spectrum and up to the highest radiant power level studied (several milliwatts). Several radiometrically important characteristics were studied and the results presented: spectral reflectance; polarization sensitivity; quantum efficiency vs. wavelength, photon flux density, and reverse bias voltage; and dark current vs. reverse bias. (19 refs.)

111767 Estimate of the parameters of photomultipliers operating in the photon-counting regime. L.V.Granitskii, N.I.Bukach, L.I.Andreeva, Z.M.Semichastnova, B.M.Stepanov (All-Union Res. Inst. for Optical-Phys. Measurements, Moscow, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.2, p.1456-8 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.127-9 (Nov.-Dec. 1982).

The time required to register a given flux at a stipulated accuracy is used as a criterion for estimating the efficiency of photomultipliers operating in the photon-counting regime and recording superweak and weak fluxes. By way of example, the proposed method is used to compare two experimental models of 28ELU-F15 photomultiplier with the EM1-6256B photomultiplier. (4 refs.)

111768 Apparatus for measurement of amplitude-frequency and phase-frequency characteristics of infrared phototransducers in the 1 MHz to 1 GHz frequency range. P.V.Biryulin, M.I.Volubuev. *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.2, p.1468-70 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.138-9 (Nov.-Dec. 1982).

An apparatus is described for measurement of amplitude-frequency and phase-frequency characteristics of infrared phototransducers at a wavelength of 10.6 μm in the 1 MHz to 1 GHz frequency range with electrooptical modulation of CO₂ laser emission and recording of the signal by means of a combined FK2-12 phase-difference meter. (4 refs.)

111769 Advantages of obliquely cut pyroelectric crystals for infrared detectors. A.Shaulov (Philips Labs., Briarcliff Manor, NY, USA). *Laser Focus (USA)*, vol.19, no.9, p.216-18 (Sept. 1983).

The author's previous work has shown that in pyroelectric crystals with strong dielectric anisotropy, a significantly higher figure of merit can be obtained by using cuts at oblique angles to the pyroelectric axis. The oblique cut can be optimized to provide the maximum figure of merit attainable for the particular material used in the chosen temperature of operation. Some basic quantitative results of this effect are reviewed and their importance for IR detector and device improvements discussed. (5 refs.)

111770 Digital radiation temperature sensor using surface acoustic waves. Y.Kasahara, R.Inaba (Central Res. Lab., Matsushita Electrical Industrial Co. Ltd., Osaka, Japan).

Natl. Tech. Rep. (Japan), vol.29, no.3, p.377-86 (June 1983). In Japanese. A study of infrared detectors using the interaction of a surface acoustic wave with a surface region heated by radiation is presented. A phase change of the surface wave is induced by the thermal effect of absorption of infrared radiation from an object. An analysis regarding the sensitivity of the frequency change and time response of the detector is described. An experiment was carried out on the Y cut Z propagation of lithium niobate. The sensitivity of the detector with a frequency change at 170 MHz was found experimentally to be approximately 3.3-8.4 Hz per degree temperature change of the object. (13 refs.)

111771 Excitation pulse-shape mimic technique for improving picosecond-laser-excited time-correlated single-photon counting deconvolutions. D.R.James, D.R.M.Demmer, R.E.Verrall, R.P.Steer (Dept. of Chem., Univ. of Saskatchewan, Saskatoon, Saskatchewan, Canada). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1121-30 (Sept. 1983).

The determination of accurate subnanosecond fluorescence lifetimes by the time-correlated single-photon counting technique is often limited by difficulties in obtaining the correct instrumental response function $f(\lambda, t)$ to the excitation pulse. These difficulties are increased when a grating monochromator is used to disperse the emission due to the introduction of an additional temporal broadening of $f(\lambda, t)$. A technique for determining the correct $f(\lambda, t)$ at the wavelength of sample emission, λ_{em} , is described. The technique consists of using a very short-lived fluorophore to 'mimic' the excitation pulse shape at λ_{em} , yielding the convoluted mimic decay function $C_m(\lambda_{em}, t)$, and then to computationally extract $f(\lambda_{em}, t)$ from $C_m(\lambda_{em}, t)$. The technique is experimentally and computationally simple and yields the desired instrumental response function at λ_{em} which eliminates problems due to the sensitivity of $f(\lambda, t)$ to λ (color shift artifact). The photomultiplier tube receives spatially equal illumination when both the sample decay and $C_m(\lambda_{em}, t)$ are determined because both the mimic and sample emission are spectrally broad, eliminating the problem of the variation of $f(\lambda, t)$ with position of incident light on the photomultiplier tube photocathode (targeting artifact). Artifacts due to monochromator temporal broadening are eliminated since both the mimic and sample emission are monitored at constant wavelength. (34 refs.)

111772 Detonic research infrared radiometer with nanosecond response. W.G.Von Holle, R.A.McWilliams (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1218-21 (Sept. 1983).

Two infrared radiometers were constructed for use in shock wave and detonation research. Fast detectors were combined with wide-band amplifiers to achieve an overall response of about 5 ns, which was confirmed by experiments on planar shocked copper plates. Detonation experiments show the merits of a new optical technique for probing detonation wave structure and for reactive and nonreactive shock wave research. (11 refs.)

07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

111773 Photodisplacement spectroscopy of solids: theory. L.C.M.Miranda (Centro Tecnico Aeroespacial, Inst. de Estudos Avancados, Sao Paulo, Brazil).

Appl. Opt. (USA), vol.22, no.18, p.2882-6 (15 Sept. 1983).

A quantitative derivation is presented for the production of the photodisplacement signal of a sample that is periodically heated by the absorption of modulated light. Numerical estimates are presented for the surface displacement of typical solids; they show that one may get signals well above the thermal noise. (17 refs.)

111774 Spectroscopy by photothermal radiometry. S.O.Kanstad, P.E.Nordal (Laser & Appl. Optics Lab., Oslo, Norway).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.357-60 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

When a sample is illuminated by pulsed radiation, the concurrent heating at the surface gives rise to a pulsating component in the specimen's thermal infrared radiation. It appears possible to observe surface temperature oscillations as small as 10^{-4} - 10^{-6} K, using current technology in infrared detection; this corresponds to the absorption in less than a monolayer. With monochromatic irradiation, absorption spectra of opaque objects can be obtained; it also becomes possible to examine subsurface structures. The authors review briefly the background of photothermal radiometry, and present some experimental results to demonstrate the technique's versatility, including some new results from studies of photosynthesis in live plants. (9 refs.)

111775 High resolution spectroscopy using picosecond pulse trains. A.I.Ferguson, R.A.Taylor (Clarendon Lab., Univ. of Oxford, Oxford, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.366-73 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The use of picosecond pulse trains in performing high resolution atomic spectroscopy is described. Methods which rely on producing Hertzian coherence and optical coherence in atoms are compared and contrasted. (23 refs.)

111776 Picosecond photoinduced dichroism detected by photothermal deflection. A.I.Ferguson, C.N.Ironside (Clarendon Lab., Univ. of Oxford, Oxford, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.374-8 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A technique which uses photothermal deflection spectroscopy to detect photoinduced dichroism is described. Some preliminary results are presented and discussed. The major advantages of the technique are the absence of a coherence spike and that there appear to be no spurious effects due to birefringence of the optical components. (7 refs.)

111777 Anomalous enhancement of photoacoustic signal in metal-film/metal-foil system. K.Azuma, H.Miyamoto, H.Inoue, T.Yamada (Dept. of Precision Engng., Osaka Univ., Osaka, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1067 (June 1983).

Photoacoustic spectroscopy (PAS) is a new technique for studying solid surfaces having various 'imperfections' that is both sensitive and useful. It enables one to measure the nonradiative absorption even in samples with irregular or granular surfaces. In this experiment, the authors constructed an apparatus to make in situ measurement possible in a vacuum evaporator and observed anomalous enhancement of the photoacoustic effect in the surface layer of metal foils on which an ultra-thin film of the same metal was evaporated. (5 refs.)

111778 Frequency modulation coherent anti-Stokes Raman spectroscopy (FM-CARS): a novel sensitive nonlinear optical method. H.Lotem (Nuclear Res. Center-Negev, Beer Sheva, Israel).

J. Chem. Phys. (USA), vol.79, no.5, p.2177-80 (1 Sept. 1983).

A frequency modulation coherent anti-Stokes spectroscopy (FM-CARS) is proposed. Using phase-modulated Stokes input field, a frequency modulated CARS output is generated. Raman resonances are detected by a CARS heterodyne signal generated in a square-law photodetector. Theoretical estimations show that a high signal-to-noise ratio which is shot-noise limited and effective background suppression are expected with the proposed method independent of the lasers polarization. In typical solvents the sensitivity estimated is $\chi_R^{(3)} = 4.8 \times 10^{-18}$ esu, which corresponds to the detection of 1.2×10^{-4} M benzene in cyclohexane. (13 refs.)

111779 Phase-polarization laser spectroscopy. V.P.Voitovich.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1427-40 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.996-1010 (Dec. 1982). [received: Sept. 1983]

The index of refraction of the medium affects the phase of the wave passing through the medium. The change in phase of the wave in the optical region of the spectrum can be measured by interference methods. Other methods for measuring the phase seemed difficult to realize. This held up the development of appropriate spectroscopic methods. Searches for methods of increasing the sensitivity of high resolution nonlinear spectroscopy led to the development of phase polarization (PP) methods. Such methods of high-resolution LS were first analyzed using methods based on measurements of the change in the polarization characteristics of a wave passing through a medium having an anisotropy induced by an external field or intrinsic anisotropy were classified with it. At the early stage of development of these methods, the phase anisotropy (birefringence) was used. At the present time, there also exist variants that use the amplitude anisotropy (dichroism). The author examines high resolution PP nonlinear spectroscopy and PP laser methods for determining optical constants. (78 refs.)

111780 Nonlinear Zeeman spectroscopy of ultrahigh resolution. N.I.Kaliteevskii, E.N.Kotlikov, V.I.Tokarev.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1451-7 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1022-9 (Dec. 1982). [received: Sept. 1983]

An original method of nonlinear Zeeman spectroscopy of ultrahigh resolution is outlined, based on an analysis of the fluorescence of the medium interacting with a standing laser wave. Different aspects of the application of this method are presented which permit conducting an investigation of the structure of the transition line and the effect of different kinds of collisions on this structure. The authors consider the fluorescence of an ensemble of atoms which is interacting with a standing laser wave. Linear and nonlinear interference signals are observed in the fluorescence of such an ensemble of atoms in the vicinity of null magnetic fields. As the magnetic field increases, a central saturation resonance caused by the spacing of 'Bennett' gaps in the magnetic

field appears, depending on the intensity of the spontaneous emission from the magnetic field. The width of this resonance is determined in the first approximation by the uniform width of the transition line Γ_{ab} . As the magnetic field increases more, the Bennett gaps from waves traveling in the opposite direction overlap, and one more 'shifted' saturation resonance is observed in spontaneous emission whose width is determined as previously by the uniform width of the transition line and whose position is determined by the difference between the generation frequency and the center frequency of line absorption. (17 refs.)

111781 Measurement Assurance Program transmittance standards for spectrophotometric linearity testing: preparation and calibration. K.L.Eckerle, V.R.Weidner, J.J.Hsia, K.Kafadar (NBS, Washington, DC, USA).

J. Res. Natl. Bur. Stand. (USA), vol.88, no.1, p.25-36 (Jan.-Feb. 1983). [received: Sept. 1983]

The authors describe the preparation and calibration of neutral density glass filters for checking the linearity of photometric response, as applied to spectral transmittance measurements. Several sets of filters were prepared from suitable neutral glass to provide nominal transmittances of 92, 70, 50, 25, 10, 1, and 0.1% at a wavelength of 548.5 nm. The filters were calibrated for spectral transmittance on the NBS Reference Spectrophotometer for high accuracy transmittance measurements. Measurements were made with a 1.5 nm passband collimated sample beam. The filters were checked for uniformity and measurements were made to determine the effects of sample beam polarization. (11 refs.)

111782 Number fluctuation spectroscopy in standing-wave fringes. M.Drewel, P.N.Pusey (Royal Signals & Radar Establ., Malvern, England).

Opt. Acta (GB), vol.30, no.10, p.1483-500 (Oct. 1983).

Considers photon correlation spectroscopy of spontaneous fluctuations in the number of particles in a small scattering volume containing interference fringes formed by counterpropagating laser beams. The 'fringe number fluctuation' contribution to the correlation function of the scattered intensity is predicted to decay exponentially in time. The particle diffusion constant can be obtained directly from the measured decay time and the easily calculated fringe spacing. Experiments were performed on both quasi-elastic and fluorescent scattering from dyed polystyrene particles of diameter 0.109 μ m in aqueous suspension. For the quasi-elastic scattering reasonable agreement with theory was found. Some difficulties were encountered with the fluorescent scattering; nevertheless, the experimentally derived value of the diffusion constant was close to the expected value. Thus the fringe number fluctuation technique appears to provide a useful modification of the usual fluorescence correlation spectroscopy. (14 refs.)

111783 Performance characteristics of a small side-window photomultiplier in laser single-photon fluorescence decay measurements. W.R.Ware, M.Pritidhi, R.K.Bauer (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1148-56 (Sept. 1983).

The performance characteristics of the Hamamatsu R928 side-window photomultiplier tube have been evaluated in the picosecond time domain. This phototube is proposed as an attractive solution to the problem of high time resolution when a sync-pumped dye laser is combined with the single-photon time correlation method for determining fluorescence lifetimes and measuring time-resolved emission spectra and polarization anisotropy. It combines excellent timing characteristics in the single-photon mode and a small-to-negligible wavelength effect with high gain, low noise, and low cost. Twice the resolution previously reported has been obtained. (35 refs.)

111784 Accuracy in analytical spectrophotometry. R.W.Burke, R.Mavrodineanu.

Report NBS-SP-260-81, Nat. Bur. Stand., Washington, DC, USA (April 1983), xiii+126 pp.

Describes activities undertaken since 1969 within the Center for Analytical Chemistry of the National Bureau of Standards (NBS) in the field of high accuracy spectrophotometry. The first part of this work presents a summary of the standard reference materials (SRMs) that have been developed for checking the proper functioning of ultraviolet and visible spectrophotometers and includes a description of the high-accuracy spectrophotometer specially constructed in the Center for Analytical Chemistry and subsequently used for performing all of the transmittance measurements. The second part of this publication is devoted to a critical discussion of the analytical factors that can affect the accuracy of selected spectrophotometric procedures that have been widely used at NBS in the characterization of various SRMs. (39 refs.)

111786 Rapid infrared multicomponent control analyses. W.L.Truett, M.A.Bayliss (Foxboro Analytical, South Norwalk, CT, USA).

Appl. Spectrosc. Rev. (USA), vol.18, no.3, p.329-71 (1982-1983). [received: Sept. 1983]

Over the past 5 years the authors have carried out a wide variety of control-type analyses in the liquid, solid, and gas phase by utilizing a single beam microcomputer controlled filter instrument. The applications discussed include those performed with the MIRAN 80 or MIRAN 980. Applications

performed using other types of spectrophotometers are also discussed. There are several types of IR instruments in commercial use today which enable one to perform multicomponent analyses with speed and accuracy. Among these types are microcomputer controlled single beam instruments, microcomputer controlled optical-null or ratio-recording double beam spectrophotometers, microcomputer controlled optical-null double beam spectrophotometers with stepping motor control for wavelength positioning, Fourier transform IR spectrophotometers of several types, and tuned laser diode instruments. Within the past 5 years there has been considerable progress in this field, and new developments in instrumentation are constantly occurring. The types noted above are discussed and contrasted. (40 refs.)

111787 Elimination of scintillation noise in dual-beam Fourier spectrometry for optical difference-reflectivity measurements. H.Krenn (Inst. fur Phys., Montanuniv. Leoben, Leoben, Austria). *Infrared Phys. (GB)*, vol.23, no.3, p.161-70 (May 1983).

The problems arising from imbalance in a double-input, double-output interferometer are treated extensively. Optical misalignments, source fluctuation and thermal distortions cause scintillation noise effects which are particularly important in the low frequency region in the far-infrared. By using a new method of double chopping in dual-beam slow-scan interferometers, ratio measurements of interferograms and spectra without scintillation noise are obtained. In addition, difference reflectivity measurements can be performed without the necessity of interchanging sample and reference. (13 refs.)

111788 FTIR photothermal deflection spectroscopy. J.S.Wong (IBM Corp., Armonk, NY, USA). *IBM Tech. Disclosure Bull. (USA)*, vol.26, no.1, p.345-6 (June 1983).

Describes how by means of Fourier transform infrared (FTIR) spectroscopy, solids in the presence of non-corrosive or corrosive liquids or gases and optically transparent solids, liquids and gases can be detected. (no refs.)

(for light sensitive materials see also 42.70)

111789 Stereo with a modern SLR. G.A.Williams.

Br. J. Photogr. (GB), vol.130, no.28, p.728-31 (15 July 1983).

Whilst specialised equipment for stereoscopic recording is available for larger undertaking, e.g. ophthalmic research, the desirable search is for a camera which without modification, is universal and fully usable for conventional or stereo photography. For extended tests and development experiments the author chose the Mamiya M645 camera as providing an eminently practical solution to the provision of a modern SLR outfit which can cover most requirements of conventional and stereo photography. This additional versatility is accomplished through convenient accessory equipment requiring no alteration or modification to the standard camera. Following a brief outline of the camera features the author goes on to look at split-image stereo theory, image inversion, 120/20 film capacity and action close-up stereo all with reference to the Mamiya system. (no refs.)

111790 Ilfocolor 100—a review. G.Ashton.

Br. J. Photogr. (GB), vol.130, no.34, p.904-5, 909 (26 Aug. 1983).

Ilfocolor 100 is described as a fine-grain, medium-speed colour negative film ideally suited to general purpose photography. It is a very competitive product in all its characteristics and is a film which is capable of giving colour prints with extremely pleasing and attractive qualities; as the manufacturer claims, it has wide exposure latitude and a good neutral overall colour latitude and a good neutral overall colour balance. Although Ilfocolor 100 film does not claim to incorporate any novel emulsion-making technology as do some of the other recently introduced colour negative films, and it is clearly intended by Ilford Ltd. to appeal to the mass market, its qualities are such that it can be used very well in professional practice when a 35 mm material with an ASA100 speed rating is required. (no refs.)

111791 Agfapan 25, 100 and 400. G.Ashton.

Br. J. Photogr. (GB), vol.130, no.36, p.947-8, 959 (9 Sept. 1983).

These newly re-introduced Agfa professional black-and-white films provide a very useful alternative range of materials with well and logically spaced speed ratings. The image quality the films provide is in keeping with their respective speeds and in all cases they would appear to be materials manufactured so as to take advantage of contemporary techniques. When used with the recommended processing solutions development times are reasonably, but not uncontrollably, short and those films which are intended for studio use have the handling characteristics which are generally thought to be essential. (no refs.)

111792 Improved Eastman Colour print films. J.A.G.Clifton (Motion Picture Sales, Kodak Ltd., London, England).

BKSTS J. (GB), vol.65, no.8, p.436-44 (Aug. 1983).

Eastman Colour print film 5384 and 7384 combine improved colour reproduction, reduced sensitivity to process variations and significantly improved dark-keeping dye stability. Eastman Colour low contrast print film 5380 and 7380 designed for making optimum-contrast prints for television use is introduced. The sensitometric characteristics, performance and processing of the new films are discussed. (2 refs.)

111793 Lenses: the angle of coverage. R.Jegerings.

Ind. Photogr. (USA), vol.32, no.8, p.25-6, 29 (Aug. 1983).

Presents some charts and a few simple calculations to help eliminate 'diagonal error'. Charts have been made up giving angles for the most used professional formats and camera lenses common to those formats. The charts are for the following formats: 35 mm full frame, 6×4.5 cm and 6×6 cm, 6×7 cm, 6×9 cm, 4×5" and 8×10", and 5×7". In some cases two formats have been combined in one chart. For the 35 mm format, horizontal angles have also been given for the format cropped to fit a sheet of 8×10" paper because many use their 35 mm cameras in this 'ideal format' manner. (no refs.)

111794 High quality, electron beam sound recording on film. N.Kihara, Y.Ozaki, H.Shirai (Advanced Engng. Div., Sony Corp., Tokyo, Japan).

IEEE Trans. Consum. Electron. (USA), vol.CE-29, no.3, p.383-7 (1983).

(1983 IEEE International Conference on Consumer Electronics, ICCE, Des Plaines, IL, USA, 8-10 June 1983).

In the project of developing a method of transferring pictures from the high definition video system (HDVS) to 35 mm motion picture film, a new audio recording method was sought which would match the quality of HDVS. This objective was achieved with a new system that produces a stereo soundtrack of the variable area type directly on the film by an electron beam. (2 refs.)

111795 Error range calculations of average gradient measurement. I.Galfi.

KeP- & Hangtech. (Hungary), vol.29, no.4, p.109-10 (Aug. 1983).

Measurement of average gradient is very important in checking film processing and in testing photographic substances. This paper deals with error range calculations of this measuring method. (2 refs.)

111796 Function of printers in the recent photofinishing industry. A.Kegy.

KeP- & Hangtech. (Hungary), vol.29, no.4, p.121-4 (Aug. 1983). (3 refs.)

111797 Special effects on film at the Moving Picture Company. I.Chisholm.

Television (J. R. Telev. Soc.) (GB), vol.20, no.3, p.101-3 (May-June 1983).

The author describes his work in the field of computer animation. For outputting the animated sequence onto film the Moving Picture Company use a conventional plotter, except the pen has been replaced by a light source. An animation camera is pointed at the plotter and focused on the plane of the light source. Driving the plotter from a computer means writing directly onto the film emulsion. Colours, diffusion and other effects are achieved with filters, which are also selected and positioned by the computer, and by multiple exposures. (no refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

111798 A secondary-ion mass-spectrometer system with high depth resolution. V.V.Yagzhev, V.V.Marusin (Inst. of Solid-State Chem. & Mineral Raw Material Processing, Acad. of Sci., Novosibirsk, Ukrainian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1458-61 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.129-32 (Nov.-Dec. 1982).

A description is given of an apparatus based on a MKh-1303 mass spectrometer that provides a sensitivity either at the level of 10^{-4} with an average rate of ion etching less than 1 Å/sec when working into a KSP-4 potentiometer, or 10^{-3} in high-speed mass spectrum recording, with a K-121 light-beam oscillograph with cyclic scanning and a wide mass range (12-150 or 150-600 amu). (9 refs.)

111799 Ion-beam scanning circuit for the MI-1305 mass spectrometer. N.N.Korobkov, O.P.Ninburg, P.G.Umantsev.

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1462-3 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.133-4 (Nov.-Dec. 1982).

An ion-beam scanning device is described that is used in the MI-1305 mass spectrometer with an ion probe to produce sputtering craters with flat bottoms. The circuit produces triangular voltage pulses with frequencies of about 1.5 kHz and 50 Hz and amplitudes of 0-500 V, which are applied to two pairs of deflecting plates. The maximum dimensions of a crater are 3×3 mm for a bombarding ion energy of 9 keV. (3 refs.)

111800 A stabilized controlled generator for a quadrupole mass spectrometer. S.A.Shubotenko, A.A.Evstifeev (Moscow Engng. Phys. Inst., Moscow, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1160-2 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.107-9 (Sept.-Oct. 1982). [received: Sept. 1983]

A generator in a quadrupole mass spectrometer is described. The range in the amplitude of the high-frequency voltage is 120-2400 V. The amplitude instability is $\leq 1.3 \times 10^{-3}$, while the instability in the ratio of the DC voltage to the amplitude is $\leq 0.5 \times 10^{-3}$ for amplitude of the output voltage of 2400 V and a temperature change of $\pm 10^\circ\text{C}$. Maximum power drawn ≤ 30 W, working frequency 1 MHz. (4 refs.)

111801 Analysis of insulating materials by negative ionmicroprobe. H.Tamura (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).

J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.179-88 (1983). In Japanese.

Summarizes recent insulator analysis methods using a secondary ion mass spectrometer (SIMS), sometimes called an ion probe, in which a beam of primary ions bombards a small spot on the surface of a sample, and positive and negative secondary ions sputtered from the surface are analyzed in a mass spectrometer. The application of secondary ion mass spectrometry is described to the analysis of inorganic insulators, plants and living things. (8 refs.) K.B.

111802 Application to bio-organic compounds [ion physics]. H.Kambara, S.Seki (Central Res. Lab., Hitachi Ltd., Tokyo, Japan).

J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.207-17 (1983). In Japanese.

For ionizing organic matter there are the plasma deposition method (PD), field deposition method (FD), laser deposition method (LD), molecular secondary ion mass spectrometry method (molecular SIMS) and fast atom bombardment method (FAB). This paper centres around the molecular SIMS; it describes dry surface molecular SIMS, matrix assisted molecular SIMS, and FAB mass spectrometry; and it makes comparison between dry surface SIMS and matrix assisted SIMS. Furthermore, the SIM spectrum of some materials is shown and molecular structure information obtained from daughter-ion spectrum measurement is given. (22 refs.) K.B.

111803 Plasma source mass spectrometry. J.Cantle (V.G. Isotopes, Winsford, England). *Lab. Pract. (GB)*, vol.32, no.8, p.31-2 (Aug. 1983).
Describes the ICP (inductively coupled argon plasma) source mass spectrometry technique with reference to the Plasma Quad system. The system was initially developed by Alan Gray (University of Surrey) and Alan Date (Institute of Geological Sciences). The features of this technique can be summarised as follows: wide range of elements determined with sub ng/ml limits of detection; automatic operation; multi-element capability; high dynamic range with linearity over six orders of magnitude; minimal matrix effects; fast sample throughput—typically a few minutes; direct analysis of solutions; simple spectra, unambiguous data; rapid isotope ratio determination; isotope dilution capability for high accuracy determinations. (3 refs.)

111804 Ion current measurement channel in single-collector mass spectrometers. M.E.Sluts'kii, M.A.Pushkina. *Meas. Tech. (USA)*, vol.25, no.12, p.991-2 (Dec. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.12, p.61-2 (Dec. 1982).
The authors consider a circuit for simultaneous measurement of five ion current components in a radio-frequency mass spectrometer used in medical, biological, and physiological research. To improve the signal/noise ratio the circuit uses automatic level adjustment and signal integration. The scanning period of mass spectrometer peaks in the analyzer is 100 msec and is synchronized with the line frequency of 50 Hz. The electrometer with a pass band up to 1000 Hz consists of a K284UD1B operational amplifier with a 2.2-G Ω input resistor. An active filter suppresses noise outside the operating frequency band. The scaling amplifier provides a variable transfer constant of 3-30 for each of the five ion current components. (1 ref.)

111805 Refraction of an ion beam by the fringe electric field in a mass spectrometer with a laser ion source. A.I.Boriskin, A.S.Bryukhanov, Yu.A.Bykovskii, V.M.Eremenko, V.M.Ivanchenko, I.D.Laptev (Fiftieth Anniversary of VLKSM Electron Microscope Factory, Sumy, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.215-17 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.351-4 (Feb. 1983). [received: Sept. 1983]
Experimental results are reported on the effects of ion beam refraction by the fringe electric field in a double-focusing mass spectrometer with a laser ion source. The results are compared with data obtained by numerically solving a mathematical model. It is shown that the change in the potential of the point at which the ion beam is injected into the electric field results in a 2-3-fold drop in the mass spectrometer resolution and a simultaneous displacement of the mass lines in the focal plane of the mass analyzer. The mass peak for singly charged ions occurs at the position of maximum spectrometer resolution and the relative number of multiply charged ions is reduced. An electrical method for reducing aberrations caused by ion beam diffraction by the fringe fields is tested. (10 refs.)

111806 Use of the 'large particle' method to calculate parameters of ion sources which employ electron impact ionization. A.S.Mal'kov (Inst. of Analytical Instrumentation, Sci.-Tech. Union, Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.217-20 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.355-60 (Feb. 1983). [received: Sept. 1983]
An algorithm using the 'large particle' method is developed for calculating the parameters of ion sources used in a quadrupole mass spectrometer. The technique includes electron and ion space charge effects and can be used to analyze transient behavior in ion sources until steady-state operation is reached. The use of the algorithm is illustrated through numerical results obtained from computer calculations for a specific source model. (6 refs.)

111807 An energy/mass analyzer with two flat capacitors. V.V.Zashkvara, V.P.Shestakov (S.M. Kirov State Univ., Alma-Ata, Kazakh SSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.221-3 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.361-4 (Feb. 1983). [received: Sept. 1983]
The parameters of an energy/mass charged particle beam analyzer consisting of two flat capacitors are analyzed. The particle energy is analyzed under static conditions and the mass is determined in the time-of-flight regime. The time of flight is focused with respect to both the beam energy and divergence angle. Various operating conditions of the energy/mass analyzer are examined. (7 refs.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS
(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

111808 A pulsed surface muon beam/pion beam for the Rutherford Appleton Laboratory Spallation Neutron Source. G.H.Eaton, A.Carne, D.H.Reading, E.G.Sandels (Rutherford Appleton Lab., Chilton, Didcot, England). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.151-67 (1 Sept. 1983).
The design and estimated performance of a versatile pulsed surface muon/pion beam for the Rutherford Appleton Laboratory Spallation Neutron Source (SNS) are presented. The characteristics of the SNS extracted proton beam are discussed with reference to their implications on the design of the muon beam and the effect on the neutron source itself. The pulsed nature of the muon beam will allow typically up to two orders of magnitude increases in the data-taking rates for μ SR experiments compared with those which are normally tolerable at the continuous-current meson factories. The versatile features of the beam are described and comparisons made with existing muon sources. Construction of the muon beam for μ SR studies has been proposed at the SNS with first operation expected in late 1984. (36 refs.)

111809 A novel design for a fast intense neutron beam. A.Bol, P.Leleux, P.Lipnik, P.Macq, A.Ninane (Inst. de Phys., Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.169-73 (1 Sept. 1983).
A novel design for the production of fast (40-75 MeV) and intense mono-kinetic neutron beam from the Li(p,n) reaction is described. The primary charged beam is dumped in a Faraday cup immediately behind the Li target. Both the production target and Faraday cup are enclosed inside a compact shielding. With respect to the conventional method where the primary beam is deflected, the advantage of this design is twofold: the neutron beam intensity is enhanced and the background is decreased. The properties of this neutron beam, i.e. its intensity, time width and spatial profile are reported. (4 refs.)

111810 Compact metal-ion beam source using thermal contact ionizer. Y.Sakai (Dept. of Appl. Phys., Osaka City Univ., Osaka, Japan), I.Katsumata, T.Oshio. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1048-56 (June 1983).
A small, compact ion beam source which can function in an external magnetic field has been developed for use with a heavy ion beam probe for plasma diagnostics. The source consists of a thermal contact ionizer with a beam material reservoir and an electrostatic lens system for beam acceleration and focusing. The beam can be modulated by means of a beam-extracting electrode. An alkali or an alkali earth metal ion beam was produced at energies up to 3 keV. The source functioned sufficiently well in a magnetic field up to 2 kG. The operating parameters for Cs⁺ and Ba⁺ ion beams were investigated in detail. A beam current up to 10 μ A and a small diameter of 1 mm at the focusing point were obtained. (17 refs.)

111811 Study of beam divergence of a low-energy (1-3 keV) ion source. K.Yatsu, S.Aoki, A.Horie, S.Miyoshi (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), K.Ota, K.Okano, N.Inoue, T.Uchida. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1071 (June 1983).
A low-energy large-current ion source is useful in many plasma experiments. One method of obtaining a large beam current at a low energy is to use a strong accel-decel grid system for ion extraction. The authors have carried out a two-dimensional computer simulation of such systems and found that the divergence angle has a minimum when the ratio α is around 10. The simulation results were confirmed by experiment. (3 refs.)

111812 Ion sources (recent topics). T.Ishitani (Central Res. Lab., Hitachi Ltd., Tokyo, Japan). *J. Vac. Soc. Jpn. (Japan)*, vol.26, no.2, p.99-107 (1983). In Japanese.
Ion beams exhibit mass and energy transport phenomena and cover a wide range of applications, e.g. surface-analyzing probes, ion implantation, ion etching, ion lithography and surface modification. There are three major ion sources: (1) plasma discharged source, (2) surface ionization source, and (3) intense field applied source. The topical areas in this review paper include: (1) The description of liquid-metal-ion sources, (2) the operational principle and structure of ion sources, (3) properties of field ionization, duoplasmatron and field emission ion sources, (4) the description and characteristics of gas field ionization ion sources, (5) ion implantation and its ion sources, and (6) the structure and characteristics of microwave ion sources. (65 refs.) K.B.

111813 Negative ion sources. J.Ishikawa, T.Takagi (Dept. of Electronics, Kyoto Univ., Kyoto, Japan). *J. Vac. Soc. Jpn. (Japan)*, vol.26, no.2, p.108-19 (1983). In Japanese.
The need for use with tandem electrostatic accelerators has been reflected in the development of negative ion sources, which can provide negative ion currents between hundreds nA and several μ A. There are the following typical negative ion sources: PIG negative ion source and its modification, duoplasmatron and its modification, the hollow discharge duoplasmatron (HDD), surface plasma source, Aarhus negative ion source (ANIS), universal negative ion source (UNIS), and neutral and ionized cesium bombardment type negative ion source (NICBNIS). The authors discuss: (1) hydrogen negative ion generation in low-electron-temperature plasma, (2) negative ion generation on a metal surface, (3) the theory of secondary negative ion emission, and (4) the description of each negative ion source. (54 refs.) K.B.

111814 Fine-focus ion beam technology for microfabrication. N.Anazawa (JEOL Ltd., Tokyo, Japan). *J. Vac. Soc. Jpn. (Japan)*, vol.26, no.2, p.196-206 (1983). In Japanese.
The fine-focus ion beam refers to an ion beam capable of focusing through a lens system because the beam is emitted from an extremely small spot. The author describes an ion optical system for high-luminance ion sources and reviews recent microstructure fabrication techniques; using the optical system. The topical areas include: (1) maskless ion injection using a 57-kV gallium ion beam equipment, (2) ion beam etching using a 35-kV Ga⁺ ion probe, and (3) ion beam lithography using PMMA resist (Dupont Elvacite 2008). (22 refs.) K.B.

111815 Effect of magnetic field on the characteristics of a hollow cathode ion source. S.Tanaka, M.Akiba, H.Horiike, Y.Okumura, Y.Ohara (Div. of Thermonuclear Fusion Res., JAERI, Ibaraki-ken, Japan). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1104-12 (Sept. 1983).
The effect of magnetic field on the performance of a hollow cathode ion source was experimentally studied. The field strength and the field distribution around the hollow cathode were changed step by step and the source parameters were recorded for each step. The result showed that with the optimum field configuration the discharge was stabilized even at low-operating gas pressures and the arc efficiency of the source was improved. Examination of the field and the neutral gas density distributions along the hollow cathode axis made it clear that the optimum field configuration was such that electrons emitted from the hot cathode surface might easily go out of the cathode cavity through the orifice being guided by the lines of force. Beam extraction from an intensively water-cooled small bucket source with the hollow cathode was carried out and hydrogen ion beams of up to 3 A at 50 keV were successfully obtained for the pulse length of up to 10 s. (8 refs.)

111816 High-current pulsed proton source. V.I.Davydenko, G.I.Dimov, I.I.Morozov, G.V.Rosylakov (Inst. of Nuclear Phys., Acad. of Sci., Novosibirsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.160-3 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.258-63 (Feb. 1983). [received: Sept. 1983]
The design of a pulsed proton source is discussed. The source generates the proton beam by extracting ions from a plasma emitter which consist mainly (>95%) of protons. Beams are produced with current >30 A and energy 25 keV, pulse duration 200 μ s, and pulse repetition frequency 0.2 Hz. The emission diameter of the beams is 9 cm and the angular divergence 10⁻² rad \times 2.10⁻² rad. (9 refs.)

07.80 ELECTRON AND ION MICROSCOPES AND TECHNIQUES

(see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)

111817 A fast-response EBIC system. C.J.Rossouw, F.J.Maher, A.A.Panjkov (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.565-72 (1983).

The application of the EBIC technique in the study of electrical activity of defects in semiconductors is discussed, with particular reference to instrumentation. A fast-response current amplifier is shown to be more than adequate for most EBIC applications. Some examples of EBIC analysis are presented. (15 refs.)

111818 Use of gold/palladium surface replicas for high kV (30), SEM examination of low Z materials. R.M.Pradhan (Hindustan Lever Res. Centre, Bombay, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.49-60 (March 1983). [received: Sept. 1983]

A procedure for making high fidelity gold/palladium surface replicas of various low atomic number (Z) materials for SEM examination has been developed. The procedure facilitates simultaneous replication of a number of SEM specimens. These replicas provide improved image quality, elimination of charging and beam penetration artifacts and microtopographical information, often not available by direct SEM examination of low Z materials at 30 kV. (5 refs.)

111819 Applications of high voltage electron microscopy in materials science. M.J.Goringe (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.41-8 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

The principal advantages of the high voltage electron microscope, higher resolution, penetrating power, decreased radiation damage and the special effects of critical voltage and displacement damage are outlined. Some application of increased penetration and radiation damage to studies in materials science are then discussed in more detail. (31 refs.)

111820 Magnetic-field-free objective lens around a specimen for observing fine structure of ferromagnetic materials in a transmission electron microscope. K.Tsuno, T.Taoka (JEOL Ltd., Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1041-7 (June 1983).

In order to observe the fine structures of ferromagnetic materials or to observe their magnetic domain structures special magnetic-field-free lenses in which specimens are set in the upper pole-piece have been developed. In these objective lenses, the spherical aberration depends largely on the shape of the lens, especially, (1) the distance between the positions of the specimen and the peak of the lens field, (2) the diameters of the pole-piece bores and the top face of the upper pole-piece, and (3) the gap length. In a lens with a pole-piece of optimum dimensions, the resulting resolution reached 0.7 nm and the leakage field strength was 0.35 mT. Complicated domain structures of ferromagnetic materials could be clearly observed. (5 refs.)

111821 High-voltage long-focus electron gun. N.N.Veniaminov, A.K.Kuzakov, N.G.Rambidi (All-Union Res. Inst. for the Study of Surface Properties in Vacuum, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1433-5 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.108-10 (Nov.-Dec. 1982).

A long-focus electron gun is described, capable of producing beams of intensity up to 230 μ A at accelerating voltages 25 and 50 kV. The minimum beam half-width is ~ 0.2 mm at a distance ~ 0.8 m from the directly heated tungsten cathode. The power supply is based on blocks of the EMMA-2 electron microscope. (8 refs.)

111822 Instrument for examining the polarization of low-energy electrons interacting with a solid. I.A.Pchelkin, G.K.Zyryanov (Phys. Res. Inst., Leningrad Univ., Leningrad, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1446-7 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.119-20 (Nov.-Dec. 1982).

An instrument is described for examining the polarization of low-energy electrons interacting with a solid, which consists of an electron source, a beam polarizer, and an analyzer. The analyzer can be applied in various ways. When PbS is used, the polarization at an incident electron energy of 125 \pm 5 eV attains 70%. (4 refs.)

111823 Electron-optical recording of nonstationary adsorption on a metal surface. V.I.Zhavoronkov, S.P.Manokhin, A.A.Antonov, V.V.Vedernikov, B.V.Filippov (Kirov Pedagogic Inst., Kirov, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1447-50 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.120-3 (Nov.-Dec. 1982).

An apparatus is described for the recording of pulse field-emission images of the surface of a solid by a three-camera electronoptical converter (e.o.c.) U-72-M. Electronoptical recording permitted diminution of the electrostatic forces responsible for migration of the electropositive adsorbate over the surface, and the field-emission current governing the thermal regime of emitter operation, which affords a possibility for investigating nonstationary adsorption under a single delivery of pulses of 1 μ sec duration to the emitter. Application of the e.o.c. permitted observation of the evolution of adsorbed filler on a tungsten emitter surface during interaction with potassium and sodium ion beams. (6 refs.)

111824 Charge-density measurement for single nanosecond electron-beam pulses. V.I.Voroshen', N.M.Chirkin (Minsk Electronics Inst., Minsk, Belorussian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1147-9 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.97-9 (Sept.-Oct. 1982). [received: Sept. 1983]

A probe is described together with an electrometer follower circuit for measuring the density of the charge (current) in single electron-beam pulses by integrating the current with a standard capacitor and recording the voltage. The measurement range is from 0.4×10^{-9} to 1×10^{-7} Cu/cm². The measurement accuracy is not worse than 5% for a beam energy of 0.2-3 keV. A limiting density of 4×10^{-6} Cu/cm² and steady current of 3 mA/cm² are due to the breakdown voltage (200 V) of the input capacitor and the insulation of the probe. (2 refs.)

111825 Atom-probe field ion microscope mass spectrometer. O.Nishikawa (Tokyo Inst. of Technol., Yokohama, Japan).

J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.147-78 (1983). In Japanese.

Atom-probe field ion microscope mass spectrometers, simply called APFIM or atom probes, utilize field evaporation phenomena exhibited from a field ion

microscope. In the atom probe, atoms are removed from the specimen by pulsed field evaporation, fly through the probe hole, and are detected in the built-in mass spectrometer. There are time-of-flight type, fan magnetic-field type and four-pole type atom probes. The author describes his developed time-of-flight type atom probe having high analysis resolution and presents its application to the analysis of TiC and TiSi₂. (17 refs.) K.B.

111826 Statistics of the atom-by-atom dissection of planes in an atom-probe field-ion microscope: the number of atoms detected per plane. A.T.Macrauder, M.Yamamoto, D.N.Sidman (Dept. of Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1077-84 (Sept. 1983).

The statistics of the atom-by-atom dissection of planes, in the atom-probe field-ion microscope, have been investigated. Tungsten specimens oriented in the [110] direction, with the probe hole over the center of the plane, were slowly pulsed field-evaporated on a plane-by-plane basis, and statistical-analyses were made on the number of tungsten atoms detected per plane; 30 separate slow dissection experiments were performed. Observed fluctuations in the number of atoms power plane are used to infer a range of allowable values for the detection efficiency. The authors found that, in some cases, the number of atoms per plane can be described as following a binomial distribution. From these results detection efficiencies in the range 0.11 to 0.54 were inferred. This range of efficiencies can be understood with the aid of field-ion desorption images. In addition, a value for the detection efficiency of 0.2 was obtained under the assumption that all atoms in the area projected by the probe hole, along the specimen radius, were analyzed. Thus, it was found that this geometrical procedure, a first-order approach to the problem, yields a reasonable result. Also, the results of a Monte Carlo simulation of atom-by-atom field evaporation of a large number of planes are presented. The Monte Carlo simulation shows that if a binomial distribution is obtained, the uncertainty in concentrations determined by the atom-probe technique will have only a small component owing to the uncertainty in the number of solvent specimen atoms—this is subject to the caveat that there are no special problems with the field-evaporation behavior of the solvent atoms. Although the statistical analyses were applied to a specific crystallographic plane and position, the methodology is reasonably general and can be applied to other situations. (28 refs.)

111827 High-resolution scanning transmission electron microscopy. A.V.Crewe (Enrico Fermi Inst., Univ. of Chicago, Chicago, IL, USA).

Science (USA), vol.221, no.4608, p.325-30 (22 July 1983).

The high-resolution scanning transmission electron microscope is being used in a growing number of laboratories. This article provides a general overview of the instrument and its capabilities. (27 refs.)

111828 Direct observation of microscopic electromagnetic fields by means of electron holography. A.Tonomura.

Solid State Phys. (Japan), vol.18, no.6, p.307-14 (June 1983). In Japanese.

Recently developed techniques of electron holography have opened the way to direct observation of microscopic electromagnetic fields in interference micrographs. (17 refs.)

111829 An improved transfer module and variable temperature control for a simple commercial cooling holder. G.Perlov, Y.Talmon (Dept. of Chem. Engng., Technion-Israel Inst. of Technol., Haifa, Israel), A.H.Falls.

Ultramicroscopy (Netherlands), vol.11, no.4, p.283-8 (1983).

A new cold stage transfer module was designed for the commercially available cooling holder of the JEOL JEM 100CX electron microscope. In the new CSTM the entire loading of the specimen is carried out under liquid nitrogen. This gives a frost-free transfer during which the temperature of the sample does not exceed 120K. Straightforward modifications to the commercial cooling holder permit continuous selection of specimen temperature between 100 and 450K. The sample can be heated or cooled at rates of up to 7K/s. These modifications do not impair the resolution of the holder which is better than 1.5 nm. This work illustrates a relatively simple way of modifying a commercial cooling holder into a true cold stage system. (9 refs.)

111830 A new high-angle annular detector for STEM. S.J.Pennycook, D.McMullan (Cavendish Lab., Cambridge Univ., Cambridge, England).

Ultramicroscopy (Netherlands), vol.11, no.4, p.315-19 (1983).

A channel plate multiplier mounted in a specimen cartridge can form an efficient high-angle detector for any STEM in which the electron gun is below the cartridge while the normal imaging and microanalysis facilities for the microscope are maintained. Such a high-angle detector minimises diffraction contrast effects from crystalline particles or supports and allows thick samples to be penetrated. It is particularly useful for catalyst studies. 07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

111831 Magnetic Compton scattering with circularly polarised synchrotron radiation. R.S.Holt, M.J.Cooper (Dept. of Phys., Univ. of Warwick, Coventry, England).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.447-52 (1 Aug. 1983).

The Compton cross-section contains a term which couples the electron spin to the circularly polarised radiation field making it possible, in principle at least, to study the spin-dependent momentum distribution of electrons in ferromagnetic materials. The intensity of circularly polarised synchrotron radiation, emitted at a small angle to the orbital plane of the circulating electrons has been calculated for the three-pole wiggler magnet on the new Synchrotron Radiation Source (SRS) at the Daresbury Laboratory. The feasibility of a magnetic Compton scattering experiment, in which this component of the beam is selected, has been evaluated for wavelengths in the range 0.1 Å to 1.0 Å. The results, calculated for a 5 mm thick magnetised iron sample, show that, within the life-time of the stored synchrotron beam (≈ 8 h) more than 10^6 counts should be accumulated under the spin-dependent Compton profile. This intensity approaches that of conventional Compton experiments with unpolarised gamma-ray sources and clearly indicates that studies of ferromagnetic materials in the wavelength region 0.25-0.5 Å should be possible on the SRS and other similar machines. (20 refs.)

111832 A simple experimental technique for very small Mossbauer line shifts using resonance detectors. I.G.Mandjukov, B.V.Mandjukova, V.G.Jelev, N.V.Markova (Dept. of Atomic Phys., Sofia Univ., Sofia, Bulgaria).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.477-81 (1 Aug. 1983).

The composite line resulting from experiments with a fixed resonance sample placed in front of a resonance detector has been studied. An 'inversion' of the composite line at high effective thicknesses of the sample has been observed. The parameter asymmetry of the composite line which is a very sensitive linear function of the relative shift between the sample and detector lines has been defined. As a test of the method the temperature red shifts of SnO_2 and CaSnO_3 have been observed. The isomer shift of CaSnO_3 line relatively to SnO_2 unresolved doublet of $+(0.028 \pm 0.0024)$ mm/s has been measured by temperature shift compensation. Some features and possible applications of the new method have been listed and commented on. (12 refs.)

111833 Self-absorption effect for low energy X-rays. M.Sarkar (Dept. of Phys., Univ. of Dhaka, Dhaka, Bangladesh).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.557-9 (1 Sept. 1983).

A method for calculating the self-absorption effect for low energy (1 keV $\leq E \leq 3$ keV) X-rays is described. The factor due to self-absorption was calculated for the M_α line of different elements ($62 \leq Z \leq 79$). For Sm ($Z=62$) and Au ($Z=79$), its value varies from 0.957 to 0.977 for a target thickness of $50 \mu\text{g}/\text{cm}^2$. The dependence of this factor on target thickness was also investigated. (4 refs.)

111834 Automatic X-ray inspection system. A.Edwards.

Process Eng. (Australia), vol.11, no.2, p.27 (Feb. 1983).

An interesting concept in automatic inspection, which uses a minicomputer to scan, interpret and sentence the results of an X-ray examination, is now available from a British company, Peerless Control Systems. The system, ART (automatic radiographic testing), has applications in many industries and can inspect at virtually any point or points in a processing line. The system combines a specially matched television camera with an image intensifier. By controlling the X-ray equipment from the computer, high quality television pictures are displayed for immediate visual inspection and for computer comparison with known standard components. Designated inspection programs can be stored on floppy disk or read only memory and test results can be taped for future analysis or reference. (no refs.)

111835 Four-dimensional reconstruction problems in cineradiography from space-time integrated projections. J.Marilleau (CEA, Sevrans, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.3-14 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The author illustrates the principles involved in achieving reconstruction of a space-time dependent object from cineradiography, i.e. from space-time integrations on the object. (no refs.)

111836 Some applications of cineradiography to gas turbines. D.A.W.Pullen (Nondestructive Testing Centre, AERE Harwell, England), P.A.E.Stewart.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.40-9 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The paper is presented in two parts. The first part deals with the investigation of basic parameters of image intensifier performance with X-ray inputs when applied to the study of dynamic events. The use of a cold neutron beam to study oil flows inside a running gas turbine is also discussed. The second part deals with the application of the developed image intensifier systems to specific studies of various problems related to gas turbines, both in the manufacturing process and in development testing. (5 refs.)

111837 Basic phenomena in high energy-density beam welding and cutting. Y.Arata (Welding Res. Inst., Osaka Univ., Yamadakami, Osaka, Japan).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.50-7 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Essential features in the dynamic behaviour of welding and cutting processes with high energy density beams are reviewed and clarified by the efficient use of various cineradiography diagnostic techniques. Formation of a deep beam hole in the weld pool are described and the important effect of the front wall characters in the beam hole is demonstrated on the natures of deep penetration and defect formations such as spiking and porosity. The cutting process is also interpreted in the frame of the same physical viewpoint with the welding. A new and efficient suppression method by spiking, porosity and humping are examined and confirmed using a Tandem Electron Beam developed by the author. (7 refs.)

111838 Pulsed high-energy radiographic machine emitting X-rays (PHERMEX): applications to study high-pressure flow and detonation waves. R.D.Dick (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.66-81 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

PHERMEX has been used as a diagnostic tool to make quantitative measurements from radiographs of inert materials under dynamic high-pressure conditions and of explosives during the detonation process. In some experiments,

radiography is the best method to study complicated hydrodynamic flow occurring in a dynamic experiment. To demonstrate the versatility and uniqueness of PHERMEX and the radiographic method, several experiments on inert solids having high and low atomic numbers are discussed with some particulars. This includes the observation of the 11.0-GPa-pressure phase transition for antimony and the accompanying two-shock structure and the off-Hugoniot data for lead using regular reflection. Also, by careful design of a radiographic experiment, the Hugoniot state behind a shock front can be completely and precisely specified. Aluminium is an example of a material studied in this manner. PHERMEX is useful in studying some detonation properties of explosives. As an illustration, the discussion includes radiographic results of divergence characteristics of a detonation wave in sensitive and insensitive explosives as it propagates past a corner and the effect of preshocking on the detonation process of insensitive explosives when the detonation wave interacts with a region that has been shock-compressed at a pressure too low to cause detonation. (16 refs.)

111839 Flash X-ray of shot exit from gun muzzles. D.M.Blake (Central Sci. Services Proof & Experimental Establ., Shoeburyness, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.82-5 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Describes the development and use of flash X-ray system to radiograph the dynamic behaviour of projectiles on exit from gun muzzles. Details of equipment, equipment protection, films, cassettes and system triggering are presented. (2 refs.)

111840 High speed cineradiography of projectiles. R.J.Bracher (Magnacine Corp., Kettering, OH, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.86-92 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Describes a camera that was developed specifically for high speed cineradiography and was designed to be used both in laboratory and field trials. The camera is programmable by digital controls and can drive flash X-ray units synchronously with framing up to a rate of 250000 FPS. An image format of nine frames 24×30 mm. A gain of times 10000 is incorporated to give amplification of low light level, short exposure X-ray flashes. (4 refs.)

111841 System of conversational image processing with two independent control-operator boards. P.Betremieux (CEA, Sevrans, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.230-8 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The Laboratory of Image Processing was founded in 1975. Its main goal was to contribute to the reading and processing of radiographic films. The author describes the present state of the Laboratory and presents some examples of image processing in the field of nondestructive testing. (no refs.)

111842 Flash X-ray generator at high energy: GREC. J.Buchet, H.Biero, G.Fourrier (CEA, Sevrans, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.240-5 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

GREC, an acronym for 'Générateur de Radiographie Eclair' was designed for visualisation, measurements and studies on dynamic behavior of materials under high explosive loading. Since the first operating time, 1975, this facility has been improving, taking advantage of progress in the techniques involved, especially focusing and transport of intense electron beams. The authors describe the X-ray machine and give some details on the image detection device. The pulse generator, a 80 stage Marx generator can deliver a peak voltage of 9 MV in $1.2 \mu\text{s}$ by series erection of 2×80 capacitors charged at ± 60 kV. The pulse-forming network, a tri-axial Blumlein, delivers a 80 ns-pulse via a 26 ohms impedance transmission line to the transport section. This transport section is a 24 cm diameter, 2 meters long, magnetic-insulated coaxial line. At the end, the X-ray radiation is emitted by bremsstrahlung of the electrons impinging the tantalum anode of the discharge diode. The image acquisition device has been designed for X-raying of objects under loading of up to 50 kg of high explosives. Some details are given on the experimental arrangement used. Despite the severe environmental shock constraints, reasonable measurements of line-integrated density are possible. (2 refs.)

111843 PHERMEX—pulsed high energy radiographic machine emitting X-rays. R.D.Dick (Los Alamos Nat. Lab., Los Alamos, NM, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.246-56 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The PHERMEX facility used to provide flash radiographs of explosives and explosive-driven metal systems is described. With this facility, precision radiographs of large objects containing materials with high atomic number and high density are attainable. PHERMEX encompasses the high-current, three-cavity, 30-MeV linear electron accelerator; the 50-MHz radiofrequency power source to drive the cavities; timing, and signal detection system; and a data-acquisition system. Some unique features of PHERMEX are reliability; very intense submicrosecond bremsstrahlung source rich in 4- to 8-MeV X-rays; less than 1.0-mm-diam spot size; precision determination of edges, discontinuities, and areal-mass distribution; and flash radiographs of large explosive systems close to the X-ray target. Some aspects of the PHERMEX-upgrading program are discussed. The program will result (1) in an increased electron-beam energy to about 50 MeV, (2) the use of an electron-gun pulser that is capable of producing three-time-adjustable pulses for obtaining three 'radiographic' pictures of a single explosive event, (3) an increased electron injection energy of 1.25 MeV, (4) the capability for recording high-speed signals, and (5) the use of computers to assist the monitoring and control of the data-acquisition system and the PHERMEX accelerator. (6 refs.)

111844 Facility for cineradiography at high energy: the ARTEMIS project. A.Hauducœur, J.Buchet (CEA, Sevrans, France), C.Perraudin, J.L.Pourre, J.Aucouturier.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.257-61 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The ARTEMIS Project, a facility for high speed cineradiography will allow spatial and temporal analysis of physical phenomena in streak or framing operation. The facility will include two parts: a linear electron accelerator (45 to 55 MeV) and an opto-electronic recording system formed by 1 to 3 cameras depending on the observation mode (streak or framing). The linear electron accelerator built by CGR-MeV, will have to deliver a radiation dose at 1 meter higher than: 10 R/μs during a 15 μs pulse, 20 R for each of three 50 ns short pulses in a 15 μs period. The main desired characteristics of the X-ray source for the authors' radiographic purposes are given. The chosen source, a L-band linear electron accelerator is described. Finally the projected image recording system is presented. (2 refs.)

111845 Flash X-ray systems. A.Mattsson (Instrument AB Scanditronix, Uppsala, Sweden).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.270-4 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The design and performance characteristics of a set of high intensity flash X-ray systems are discussed. At present, six systems are available with output voltages in the range of 75 kV to 1200 kV. Peak current is 10 kA and exposure time 20 ns. Demountable X-ray tubes are being used to increase flexibility and reduce operating costs. Typical applications are found in areas such as ballistics, detonics, quality control, etc. (no refs.)

111846 Magnetic focus/deflection image converter camera for cineradiography. R.J.Bracher (Magnacine Corp., Kettering, OH, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.286-9 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

This camera was developed specifically for high speed cine radiography and was designed to be used both in laboratory and field trials. The camera is programmable by digital controls and can drive flash X-ray units synchronously with framing up to a rate of 250000 fps. An image format of nine frames 24X30 mm and a gain of 10000 is incorporated to give amplification of low light level short exposure X-ray flashes. (3 refs.)

111847 Image converter tubes for radiology and neutronography used in nondestructive testing. M.Verat, H.Rougeot (Thomson-CSF Div. Tubes Electroniques, Paris, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.290-7 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Describes the basic structure and the fabrication process of radiation-sensitive image-converter-tubes; these tubes are self-sensitive for 10 keV to 10 MeV photons or cold and thermal neutrons. In most general use, these tubes have an effective field aperture of 22 or 30 cm but it is also possible to make smaller (15 cm) or larger (40 cm) tubes. Data and application characteristics of these tubes are given. The conversion factor (the output image luminance corresponding to a given input radiation) is high enough to allow real-time acquisition of the image, as with a TV camera or a high speed camera for example. Typical conversion factors are $100 \text{ cd.m}^{-2}.\text{mR}^{-1}.\text{s}$ for X-rays and $3 \times 10^{-10} \text{ cd.s.n}^{-1}$ for neutrons. The spatial resolution is 2.5 to 5 lp.mm⁻¹ depending on the kind of tube; density steps of 2% are detected. Applications of these tubes are illustrated by examples in medicine (cine-angiography and televised-surgery) as well as in ballistics. (no refs.)

111848 X-ray microscopy: recent developments and practical applications. B.Niemann, G.Schmahl, D.Rudolph (Univ. Sternwarte, Göttingen, Germany).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.2-8 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

X-ray microscopy using soft X-rays has progressed successfully during the past years. The authors discuss the atomic cross sections, the photoelectric absorption and the radiation damage for soft X-rays. Results of contact microradiography are summarized. X-ray optics, which can be used for microscopy are zone plates, grazing incidence mirrors and normal incidence multilayer mirrors, yet this has only been shown in practice with high resolution for zone plates. Details of the 'Göttingen X-ray microscope' are given and a photographic image, showing 50 nm resolution, is shown. The future work of several groups is concentrated on the development of scanning X-ray microscopes. (32 refs.)

111849 Application of synchrotron radiation to X-ray microscopy. P.J.Duke (Daresbury Lab., Sci. & Engng. Res. Council, Warrington, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.21-5 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

Describes work currently going on or under development at the Daresbury Laboratory at shorter X-ray wavelengths, where shorter in this instance means wavelength $< 4 \text{ \AA}$. (11 refs.)

111850 The investigation of image formation in a large-area solid state X-ray receptor with electrophoretic display. K.H.Yang (General Electric Corporate Res. & Dev., Schenectady, NY, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.4711-21 (Sept. 1983).

The image formation and the resolution of a self-contained electrophoretic X-ray imager have been investigated. The electrophoretic suspension contained pigments and counterions, ionic surfactants, and extraneous charges. Rate equations have been formulated to describe the transport properties of the ionic surfactants from the low to high field regions. The electrical transport properties of the electrophoretic suspension were investigated in relation to X-ray image formation using three different modes of operation: the pulse, the biased-pulse, and the universal modes. The reflectance versus charge curves of the X-ray images were qualitatively explained. Both negative- and positive-mode X-ray images of $22 \times 22 \text{ cm}^2$ have been demonstrated with two different electrophoretic suspensions. The imager can achieve X-ray images of high resolution and large area at the same time. (19 refs.)

111851 Square wave gratings for screen-film-combination modulation transfer function determination. D.Hoeschen (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).

Optik (Germany), vol.65, no.2, p.97-101 (1983). In German.

Square wave gratings of lead are often used for the determination of the modulation transfer function of screen-film-combinations. Model calculations show how square wave gratings with continuously changing frequencies should be designed. (4 refs.)

111852 Streak camera for picosecond X-ray diagnostics. P.A.Jaanimagi, M.C.Richardson (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1095-9 (Sept. 1983).

The authors report details of an X-ray sensitive streak camera with an estimated time resolution of less than 10 ps. The streak camera is based on a modified RCA 73435 image tube and features a large photocathode area and high sensitivity. A direct comparison of the relative quantum efficiency of Au and CsI photocathodes for 1-10 keV X-rays is also presented. (17 refs.)

111853 Investigation on the real-time pseudocolor display of three-dimensional X-ray image. Zhang Sen, Zhang Guangzu (Hangzhou Univ., China).

Sci. Sin. (China), vol.26, no.7, p.777-84 (July 1983).

On the basis of the principle of binocular stereoscopy and the principle of pseudocolor display with intensity slicing, a method of the real-time pseudocolor display of three-dimensional X-ray image is proposed. One X-ray stereo-source composed of two triode X-ray tubes, one image intensifier, and one plumbicon camera are used as TV camera system. By means of processing the electronic image with the pseudocolor technique, the authors have

successfully transformed the invisible X-ray image into a visible pseudocolor image which is of clear three-dimension and enhanced contrast. (9 refs.)

07.90 OTHER TOPICS IN SPECIALISED INSTRUMENTATION

111854 The Australian high resolution neutron powder diffractometer. C.J.Howard, C.J.Ball (Lucas Heights Res. Labs., Australian Atomic Energy Commission Res. Establ., Sutherland, New South Wales, Australia), R.L.Davis, M.M.Elcombe.

Aust. J. Phys. (Australia), vol.36, no.4, p.507-18 (1983).

The high resolution neutron powder diffractometer installed on the AAEC HIFAR reactor at Lucas Heights is described. The resolution is in good agreement with predictions and, although below the most optimistic estimates, the intensities are usable. Examples are given of problems solved using the diffractometer which could not have been solved either by X-ray diffraction or by use of a conventional neutron powder diffractometer. Plans for diffractometer development are outlined. (24 refs.)

111855 Goniometer for pole figure measurement by means of neutron diffraction method. M.Dlouha, J.Jerabek, S.Vratilav (Fakulta Jaderna a Fyzikalne Inzenyrská CVUT, Praha, Czechoslovakia).

Jad. Energ. (Czechoslovakia), vol.29, no.8-9, p.316-18 (Aug.-Sept. 1983). In Czech.

The article describes a goniometer which was constructed and made in neutron Diffraction Laboratory of Faculty of Nuclear Science and Physical Engineering. The most important application is texture analysis of different materials after cold-worked or thermal treatment. The instrument is operated together with a neutron diffractometer, a control unit assures automatic measurements. Characteristic parameters and examples of utilization are given. (3 refs.)

111856 Sample-size determination in the certification of suspensions of monodisperse particles. I.I.Kravchenko.

Meas. Tech. (USA), vol.25, no.11, p.964-6 (Nov. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.11, p.64-6 (Nov. 1982).

Suspensions of monodisperse particles are used extensively in the testing of aerosol equipment and in a number of research programs. The basic characteristics of such suspensions determined in certification are the average particle size (diameter) and the degree of monodispersity (the entire discussion of this article refers to spherical particles). The suitability of a particular suspension of a specific application depends on the error of estimation of its parameters. The error of determination of the characteristics of the suspension, in turn, depends on the sample size, i.e. on the number of particles in the suspension subjected to analysis. A procedure used for the certification of suspensions is presented. (no refs.)

111857 Cold neutron fluoroscopy of operating automotive engines. P.A.E.Stewart (Rolls-Royce Ltd., Bristol, England), J.Heritage.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.635-42.

The application of neutron fluoroscopy in the automotive industry is a natural extension of previous studies with aircraft engines. The paper describes investigations with two subcompact car engines. The extent and manner in which lubricants reached the various parts of the engines are compared and contrasted. The paper goes on to describe a study of the deposits inside turbochargers and postulates future topics worthy of investigation. The authors

confirm that there is a place for neutron fluoroscopy both as a design tool and for investigations of 'in-service' phenomena. (5 refs.)

111858 High frame-rate neutron radiography of dynamic events. R.H.Bossi, A.H.Robinson, J.P.Barton (Oregon State Univ., Corvallis, OR, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.643-51. A system has been developed to perform neutron radiographic analysis of dynamic events having a duration of several milliseconds. The system has been operated in the range of 2000 to 10000 frames/second. Synchronization has provided high-speed-motion neutron radiographs for evaluation of the firing cycle of 7.62 mm munition rounds within a steel rifle barrel. The system has also been used to demonstrate the ability to produce neutron radiographic movies of two phase flow. Special studies have been performed on the scintillator conversion screens and on the effects of statistical limitations on the image quality. Modulation transfer function analysis has been used to assist in the evaluation of the system performance. (13 refs.)

111859 Performance of the Mound Facility Californium Multiplier. J.D.Hastings (Monsanto Res. Corp., Miamisburg, OH, USA). Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.695-7. The Californium Multiplier (CFX) is a subcritical fission system which supplies neutrons for neutron radiography and neutron activation analysis. Such a unit has been built by IRT Corporation for use with approximately 20 mg Cf-252, was installed at the Mound Facility in September 1977, and has been operating since October 1977. The Mound CFX is primarily used for neutron radiography and is capable of producing neutron radiographs nearly similar in quality to those obtained by reactor facilities. Approximately 65000 parts have been radiographed in the more than three year period from October 1977 to June 1981. The description and performance of the CFX facility are presented. (1 ref.)

111860 A new accelerator-based neutron radiography system. J.Stokes, L.Parks, C.Preskitt, J.John, H.R.Lukens,Jr., J.MacKenzie, R.Voigt, J.Wilson, N.Lurie, A.P.Trippe (Nuclear Systems Div., IRT Corp., San Diego, CA, USA), W.Davis.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.717-24. A new neutron radiography system capable of accommodating an accelerator source of neutrons has been developed at IRT Corporation. The new system, consisting of a shielded moderator with a specially designed thermal neutron beam port and an access port for an accelerator beam tube, was transported to an available 4-MeV Van de Graaff accelerator for system evaluation. A suitable beam tube extension contained a water-cooled Be target. The target was bombarded with 5-150 μ A of 3 MeV deuterons, and for some tests the deuteron energy was varied from 1.5 to 4.0 MeV. The system was found to be capable of producing a thermal flux of 1.3×10^6 n cm⁻² sec⁻¹ at a collimation ratio of 20:1, for a 300 μ A current of 3.0-MeV deuterons on target. The neutron-to-gamma ratio of the beam was found to be 1.0×10^5 n cm⁻² mR⁻¹, and the measured cadmium ratios were 3.5 and 18.3 for Au foils and ²³⁵U detectors, respectively. Several excellent-quality radiographs of ordinance items were obtained. (8 refs.)

111861 Optimisation of etching conditions and shortening of the etching time of cellulose nitrate films. M.Fantini, G.Renard (Kodak-Pathe Res. Labs., Paris, France).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.737-44. The light depolarization method for the measurement of the optical densities of a picture on cellulose nitrate film was used to plot the precise sensitometric curves of these films. It is found that the apparent sensitivity decreases when the film is over etched or overexposed. By means of these curves, it is possible to select optimal conditions. Results of the research work to minimize etching time are described. The purpose is to permit the routine use of neutron radiography and heavy ion radiography by making an access to the image in a reasonable time. (1 ref.)

11.10 FIELD THEORY

111862 Multidyon solutions in SU(2) gauge group. Jiin Chang Shaw (Dept. of Appl. Maths., Chiao Tung Univ., Hsinchu, Taiwan), Jiunn Chuu Chen. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.37-53 (Dec. 1982). [received: Sept. 1983] Recently, Prasad described a systematic framework for the construction of axially symmetric multimonopole solution of arbitrary topological charge. The authors found that these solutions can be transformed into axially symmetric multidyon solutions easily. They write down the multidyon solutions in Yang's K-gauge also. (17 refs.)

111863 The group theoretical aspects of infinitesimal Riemann-Hilbert transform and hidden symmetry. Wu Yong-Shi (Centre de Phys. Theorique, CNRS, Marseille, France). *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.461-72 (1983). The author obtains explicit expressions for infinitesimal regular Reimann-Hilbert (RH) transforms. Using them, the group theoretical aspects of infinitesimal RH transforms are discussed with an eye to the comparison with the hidden symmetry transformations proposed before. The author finds that the RH transforms have very rich group structure; e.g. in the 2-d principal chiral models, their group contains two Kac-Moody algebras as subalgebras. But not all of them are nontrivial hidden symmetries of the theory. (17 refs.)

111864 Classical equations $dN_i/dr = 1/2\epsilon_{ijk}[N_j,N_k]$. N.Ganoulis (Dept. of Theoretical Phys., Univ. of Thessaloniki, Thessaloniki, Greece). *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.493-6 (1983). The author studies the first order system of equations $dN_i/dr = 1/2\epsilon_{ijk}[N_j,N_k]$, where the n_i are classical, 'nonabelian' gauge-Higgs fields with spherical symmetry. Exact solutions are constructed. (5 refs.)

111865 Counterexamples to some results on the existence of field copies. M.A.Mostow (Dept. of Maths., North Carolina State Univ., Raleigh, NC, USA), S.Shnider. *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.521-6 (1983). Several criteria are known for determining which connections A are determined uniquely by their curvature F , or by F and its covariant derivatives. On a principle bundle with semi-simple gauge group G over a 4-manifold M , a sufficient condition for F to determine A uniquely is that the linear map $B \rightarrow [F \wedge B]$ from Lie algebra-valued 1-forms to 3-forms (pulled back to M via a local gauge) be invertible on an open dense set in M . Recently F.A. Doria has claimed that this condition is also necessary. The authors present counterexamples to this claim, and also to his assertion that F determines A uniquely if the restriction of the bundle to every open subset of M has holonomy group equal to G and F is 'not degenerate as a 2-form over space-time'. (18 refs.)

111866 Wilson loop calculations in four-dimensional lattice gauge theory on the CDC CYBER 205. D.Barkai (Center for Appl. Vector Technol., Colorado State Univ., Fort Collins, CO, USA), M.Creutz, K.J.M.Moriarty. *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.13-19 (July-Aug. 1983). Pure SU(4) gauge theory is simulated by Monte Carlo methods on an 8⁴ lattice. The method of Metropolis et al. (1953) is used to equilibrate the space-time lattice. All Wilson loops up to size 4 \times 4 are calculated. Because of memory requirements the authors work on the 2 Mword CDC CYBER 205 at Colorado University and take full advantage of the parallel processing capabilities of this vector machine. (15 refs.)

111867 Halliday-Suranyi expansion for lattice ϕ^4 theory. J.M.Rabin (J.W. Gibbs Lab. of Phys., Yale Univ., New Haven, CT, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.308-28 (12 Sept. 1983). The Halliday-Suranyi perturbation expansion for the anharmonic oscillator is generalized and applied to ϕ^4 field theory on a spatial lattice. This expansion is believed to converge for any value of the coupling constant. It also serves as a model of renormalization-scheme dependence in QCD in that physical quantities depend on an arbitrary parameter at finite order but not when the series is summed. The propagator is computed through second order and the single-particle dispersion relation is extracted at strong and weak coupling. The results test both the expansion itself and Stevenson's principle of minimal sensitivity (PMS) for determining the arbitrary parameter. The author shows that use of the PMS prescription can alter the convergence properties of the expansion. (10 refs.)

111868 Fermi-Bose gas equivalence, non-Abelian symmetry groups, phase transitions and all that. S.A.Bulgadaev (L.D. Landau Inst. for Theoretical Phys., Moscow, USSR). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.349-78 (12 Sept. 1983). The equivalence triad of the two-dimensional massive Thirring model, sine-Gordon theory and the Coulomb gas is generalized to theories with non-Abelian symmetry groups. The group and field theoretical properties of the resulting bosonic theories, connected with the characters of the corresponding groups, are investigated. (40 refs.)

111869 Ising lattice gauge theory in three dimensions. P.P.Martin (Dept. of Phys., Queen Mary Coll., London, England). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.366-82 (5 Sept. 1983). By raising the transfer matrix to a finite power the partition function for a finite lattice Z(2) gauge model is obtained exactly. The zeros of the resultant polynomial are found and some plaquette-plaquette expectation values are extracted. An exponential fit for the inverse correlation length matches onto both strong-and weak-coupling results but breaks down close to the second-order phase transition point. Similar calculations for the three-dimensional Ising model are also discussed. (19 refs.)

111870 Dynamical fermions in lattice gauge theories: Metropolis and Langevin techniques in two dimensions. T.Burkitt (Phys. Dept., Univ. of Edinburgh, Edinburgh, Scotland). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.401-14 (5 Sept. 1983). A variety of techniques for the inclusion of dynamical fermions in lattice gauge theory is examined. Three pseudo-fermionic techniques that have the characteristics desirable for an unquenched simulation of four-dimensional QCD are studied in detail. Langevin and Metropolis pseudo-fermionic techniques are implemented for a 64 \times 64 lattice on the Distributed Array Processor and their relative merits examined both for free fermions and the lattice Schwinger model. (33 refs.)

111871 Distribution of zeros in Ising and gauge models. C.Itzykson, R.B.Pearson, J.B.Zuber (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.415-33 (5 Sept. 1983). The authors discuss some features of Ising and gauge systems in the complex temperature plane. The distribution of zeros of the partition function enables one to study critical properties in a way complementary to the methods using real values. Data on small lattices confirm this picture. Nearby complex singularities seem to exhibit a universal behaviour which might have some relation with a model of random surfaces. (17 refs.)

- 111872 Loss of continuum Lorentz invariance in gauge theories on a triangular lattice.** W.Celmaster, F.Krausz (Northeastern Univ., Boston, MA, USA). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.434-46 (5 Sept. 1983).
On a triangular lattice, a weakly chiral lagrangian of interacting bosons and fermions is constructed to be naturally invariant under the triangular symmetry. The continuum limit of the resulting field theory is not Lorentz invariant. The authors explicitly show this for the propagator of the massive Schwinger model. (13 refs.)
- 111873 Flavours of Lagrangian Susskind fermions.** H.Kluberg-Stern, A.Morel, O.Napoly (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France), B.Petersson. *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.447-70 (5 Sept. 1983).
The authors show how to write the Susskind fermionic action explicitly in terms of flavour Dirac fields defined on hypercubes in position space. The remnant continuous global symmetry is identified with a $U(1)_A \otimes U(1)_A$ group, where the axial symmetry is flavour non-singlet. This construction allows us to identify the quantum numbers of states found in dynamical calculations for $SU(N)$ gauge theories, and the currents associated with the above global symmetry. It is also used in the strong-coupling limit to compute the decay constant of the pseudo-scalar Goldstone boson associated with the spontaneous breakdown of the $U(1)_A$ symmetry. The authors stress that the construction of flavours leads to a quark propagator which is continuous on the edges of the Brillouin zone, unlike the one obtained by assigning different flavours to different parts of this zone. (21 refs.)
- 111874 An improved mean field approach to the phase structure in Z_N gauge theory in four dimensions.** K.Odaka, M.Fukugita (Nat. Lab. for High Energy Phys., Tsukuba, Ibaraki, Japan). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.471-8 (5 Sept. 1983).
The authors extend the mean field approximation scheme to include the effect of a fluctuation of the gauge field. As a consequence, they successfully obtain for the Z_N theory ($N > 5$) the phase transition which separates the Coulomb phase for the ordered phase as well as that separating the Coulomb and disordered phases. The former transition shows characteristics of higher-order phase transitions. (8 refs.)
- 111875 The accuracy of the pseudo-fermion method.** S.Otto, M.Randeria (California Inst. of Technol., Pasadena, CA, USA). *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.479-90 (5 Sept. 1983).
The pseudo-fermion method for dynamical fermions is studied using Monte Carlo techniques. Various approximations are tested by calculating the mass gap of the Schwinger model and by comparing it with results obtained with an exact algorithm. The mass found is consistent with that obtained from the exact algorithm, implying that the systematic errors are small. In addition, the mass is almost independent of the number of pseudo-sweeps used, implying that the statistical error inherent in the Monte Carlo of the pseudo-fermion field does not have a strong effect on the observable. Numerical evidence is presented to show that the algorithm gives the correct answer for even a single pseudo-sweep in the limit that the Metropolis hit size goes to zero. (12 refs.)
- 111876 Uniformly valid amplitude expansions for non-Abelian gauge theories.** J.L.Anderson (Dept. of Phys., Stevens Inst. of Technol., Hoboken, NJ, USA). *Gen. Relativ. & Gravitation (USA)*, vol.15, no.8, p.785-95 (Aug. 1983).
The imposition of a particular gauge condition in a non-Abelian gauge theory may lead to large- r nonuniformities in an amplitude expansion when used in the construction of an approximate solution of the field equations of the theory. The author shows that for both the Yang-Mills theory and general relativity it is always possible to find a class of gauge conditions that do not suffer from this defect and at the same time lead to solvable equations in each order of the approximation employed. The author further shows how one can construct such gauge conditions by a method similar to Lighthill's method of strained coordinates. An example of such a construction is given for the Yang-Mills theory. (5 refs.)
- 111877 Local conservation laws for the two-dimensional periodic $SU(n+1)$ Toda lattices.** R.S.Farwell (Blackett Lab., Imperial Coll., London, England), M.Minami. *J. Phys. A (GB)*, vol.15, no.11, p.3405-10 (Nov. 1982).
An infinite number of local conservation laws are derived for the two-dimensional periodic $SU(n+1)$ Toda lattice equations following the well known method for the sine-Gordon equation. (9 refs.)
- 111878 Auxiliary 'fields' for the massive spinning relativistic particle.** K.Sundermeyer (Inst. fur Theorie der Elementarteilchen Annimallee, Freie Univ. Berlin, Berlin, Germany). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.16, p.556-60 (20 Aug. 1983).
The author considers the massive spinning relativistic particle formulated in terms of Grassman variables. The Lagrangian action and auxiliary fields are studied. (8 refs.)
- 111879 Conformal symmetry and new exact solutions of SU_2 Yang-Mills theory.** W.I.Fushchich, W.M.Shtelen (Math. Inst., Kiev, USSR). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.2, p.37-40 (10 Sept. 1983).
Conformally invariant and some others exact solutions of the SU_2 Yang-Mills (YM) theory are found. The final conformal transformations for the YM potentials and the formulae of generating new solutions from known ones are presented. (7 refs.)
- 111880 The field with spin 2. I.** M.H.Nous (CRN, Univ. Louis Pasteur, Strasbourg, France). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.3, p.65-71 (17 Sept. 1983).
From the theory of higher-spin fields as proposed by Bargmann-Wigner, (1948), the author presents and discusses the formulation of the fourth-rank symmetric spinor $\psi_{abcd}(x)$ which describes the massive spin-2 field. This spinor is then used for the formulation of the Lagrangian and the derivation of the field equation and all the additional conditions. (17 refs.)
- 111881 The field with spin 2. II.** M.H.Nous (CRN, Univ. Louis Pasteur, Strasbourg, France). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.3, p.72-6 (17 Sept. 1983).
For pt.I see *ibid.*, vol.38, p.65 (1983). Discusses the plane-wave solution for the fourth-rank spinor $\psi_{abcd}(x)$ which represents the massive spin-2 field. The relativistic transformations of this field and the bilinear combinations of the components of the wave function are considered. (4 refs.)
- 111882 Renormalization scheme-invariant perturbation theory.** A.Dhar (Tata Inst. of Fundamental Res., Bombay, India). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.407-10 (8 Sept. 1983).
A complete solution to the problem of the renormalization scheme dependence of perturbative approximations to physical quantities is presented. An equation

is derived which determines any physical quantity implicitly as a function of only scheme independent variables. (4 refs.)

- 111883 Quantization of nonlinear sigma model in constrained hamiltonian formalism.** J.Maharana (Inst. of Phys., Bhubaneswar, India). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.411-14 (8 Sept. 1983).
The canonical structure and quantization of the $O(N)$ nonlinear sigma model is investigated in the constrained hamiltonian formalism due to Dirac. The explicit form of the quantum hamiltonian of the $O(3)$ nonlinear sigma model is obtained. (6 refs.)
- 111884 String tension in $SU(3)$ gauge theory on a 16^4 lattice.** F.Gutbrod (DESY, Hamburg, Germany), P.Hasenfratz, Z.Kunszt, I.Montvay. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.415-17 (8 Sept. 1983).
Wilson loop expectation values are measured with improved statistics at $\beta=5.40$ and 5.70 by the Monte Carlo method. In this coupling constant region the (dimensionless) string tension drops more rapidly than required by the one-loop renormalization formula. (6 refs.)
- 111885 The Eguchi-Kawai model in two dimensions.** G.Maiella (Istituto di Fisica Teorica, Naples, Italy), P.Rossi. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.421-4 (8 Sept. 1983).
The strong coupling expansions of the free energy for the Eguchi-Kawai model in two dimensions is evaluated by the use of the character expansion for the two-matrix model. The analyticity domain of the formal series in the complex β plane is smaller than the entire complex plane showing quite a pathological behaviour. (10 refs.)
- 111886 An improved renormalization group transformation in four dimensions.** R.Cordery, R.Gupta, M.A.Novotny (Phys. Dept., Northeastern Univ., Boston, MA, USA). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.425-30 (8 Sept. 1983).
A new transformation for Monte Carlo renormalization group analysis of four-dimensional gauge theories is developed. This RG transformation has a scale factor of $\sqrt{3}$. In addition no gauge fixing is required in the construction of the link variables on the renormalized lattice. The $Z(2)$ theory is analyzed as a test case. (14 refs.)
- 111887 Large N reduced models and stochastic quantization.** G.Aldazabal, N.Parga (Centro Atómico de Bariloche, Bariloche, Argentina), M.Okawa, A.Gonzalez-Arroyo. *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.90-4 (15 Sept. 1983).
The authors study the reduction of degrees of freedom for large N matrix models, by means of the stochastic quantization procedure. This provides a simple proof of the validity of the reduction in perturbation theory. In addition, a large class of reduced models are constructed which contain as particular cases those considered previously in the literature. (13 refs.)
- 111888 Improved lattice actions and physical quantities.** R.Musto, F.Nicodemi, R.Pettorino (Istituto di Fisica Teorica, Univ. di Napoli, Naples, Italy). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.95-8 (15 Sept. 1983).
The authors compare for the usual and for an 'improved' action the approach to the continuum limit of physical quantities in the lattice $O(N)$ nonlinear σ -model using large N techniques. They find a definitely improved behaviour, which for the renormalized coupling constants is due to the absence of all $O(a^2 \ln a)$ terms. The results fit nicely with those obtained recently for $N=3$ in a Monte Carlo simulation. (7 refs.)
- 111889 Dynamical gauge symmetry breaking as the Casimir effect.** Y.Hosotani (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.193-7 (22 Sept. 1983).
A new mechanism of dynamical gauge symmetry breaking is found in a class of higher dimensional theories. A system consisting of non-abelian gauge fields and fermions with minimal gauge interactions on a spacetime $M^n \times S^2$ is considered, where M^n and S^2 are an n -dimensional Minkowski spacetime and a surface of a sphere, respectively. Full analysis is given for odd n . By integrating fermion fields first, the author finds that gauge symmetry is dynamically broken for $n=4p+3$ ($p=0, 1, 2, \dots$), provided that there exists a sufficiently heavy fermion. The phenomenon originates from a shift in fermion zero point energies due to compactness of the extra dimensional space S^2 , being quite similar to the Casimir effect in electrodynamics. (23 refs.)
- 111890 Topological charge distribution in $SU(N)$ gauge theories.** C.M.Bishop, P.V.D.Swift (Phys. Dept., Univ. of Edinburgh, Edinburgh, Scotland). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.198-200 (22 Sept. 1983).
The probability distribution function for topological charge contained in a sphere of finite radius is calculated. The authors find no need to introduce an arbitrary cutoff on instanton scale sizes as this is controlled by the size of the sphere. Recent Monte Carlo calculations reflect qualitatively all the features of the results. (5 refs.)
- 111891 An exact solution of the Jackiw-Rebbi equations for a Fermion-monopole-Higgs system.** A.M.Din (Inst. of Theoretical Phys., Univ. of Lausanne, Lausanne, Switzerland), S.M.Roy. *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.201-4 (22 Sept. 1983).
The authors present an exact solution for arbitrary partial waves to the Jackiw-Rebbi equations for an isospinor fermion in the background of a non-abelian singular magnetic monopole and a Higgs field. The Higgs coupling produces a centrifugal barrier making the Hamiltonian self-adjoint with ordinary conditions at the origin. There are infinitely many bound states, each doubly degenerate. The scattering is charge conserving. (15 refs.)
- 111892 Infinite N phase transitions in one-plaquette $(2+1)$ -dimensional models of lattice gauge theory with Manton's action.** O.Trinhammer (Inst. of Theoretical Phys., Goteborg, Sweden). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.234-8 (22 Sept. 1983).
Pure gluon $U(N)$ lattice gauge theory is solved by the transfer matrix method in a semiclassical approximation for Manton's action showing a third order phase transition at $\lambda_c = g^2 N = \pi^2/2$. (21 refs.)
- 111893 Finite element Hamiltonian Monte Carlo of $SU(2)$.** D.Sen (Dept. of Phys., Princeton Univ., Princeton, NJ, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.239-45 (22 Sept. 1983).
Following Bender et al., the author applies the finite element method to a compact non-abelian system. The author does a Hamiltonian Monte Carlo on a $0+1$ dimensional lattice and compares the results with those obtained by a finite difference method. For the kinetic energy, the Feynman-Hell prescription is followed and the finite element method is shown to be distinctly superior. (10 refs.)
- 111894 Generalized Koba-Nielsen-Olesen scaling.** C.S.Lam (Dept. of Phys., McGill Univ., Montreal, Quebec, Canada). *Phys. Rev. D (USA)*, vol.28, no.5, p.1228-31 (1 Sept. 1983).
Implications for generalized Koba-Nielsen-Olesen (KNO) scaling, namely KNO scaling at a fixed pseudorapidity interval, are discussed. Predictions can be obtained for semi-inclusive pseudorapidity distributions and vice versa. These predictions agree very well with the CERN ISR and $\bar{p}p$ collider data

and they should be tested against e^+e^- , lepton-nucleon, and other hadronic data. A theorem about the relative magnitudes of the moments for different generalized KNO curves is proven. Consequences and validity of a 'strong scaling hypothesis' are discussed. (14 refs.)

111895 New generalization of Dirac's positive-energy relativistic wave equation. Liu Zhe-ming (Peking Feng-Yuan Inst. of Mech. & Electric Engng., Peking, China).

Phys. Rev. D (USA), vol.28, no.6, p.1326-32 (15 Sept. 1983). The relativistic wave equation for a spinless massive particle, suggested by Dirac ten years ago, has only positive-energy solutions. However, this new system of wave equations becomes inconsistent when electromagnetic interactions are included. This is a defect. In this paper, Dirac's work is generalized for cases in which the symmetry of interchangeability among the subparticles in each group contained in a particle satisfied. The inconsistency of Dirac's positive-energy wave equation is avoided either by having a more complex internal structure for a particle or by increasing the degrees of freedom of motion for the internal subparticles involved in this same particle. (6 refs.)

111896 Supersymmetric particles in $N=2$ superspace: phase-space variables and Hamiltonian dynamics. J.A.de Azcarraga, J.Lukierski (Internat. Centre for Theoretical Phys., Trieste, Italy).

Phys. Rev. D (USA), vol.28, no.6, p.1337-45 (15 Sept. 1983). The authors consider a reparametrization-invariant model recently proposed based on the N -extended super-Poincaré group with central charges, which leads to trajectories on the N -extended Salam-Strathdee superspace. The case $N=2$ is discussed in detail. They show that the $N=2$ model is invariant under four real supergauge transformations generated by first-class odd constants which imply the Dirac equation. They introduce one bosonic (which fixes the reparametrization) and four real spinorial (which fix the supergauge) gauge conditions and calculate the Dirac brackets for the remaining unconstrained variables ($\tilde{x}, \tilde{p}, \tilde{\theta}, \tilde{\theta}^c$). The equations of motion are written in Hamiltonian form, with $H \propto \text{Tr}\{Q_{\alpha i} Q_{\beta i}\}$ and correspond to the Heisenberg equations of the (first) quantized theory. (28 refs.)

111897 Symmetry breaking and phase transitions in general statistics. R.Y.Levine, Y.Tomozawa (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1358-63 (15 Sept. 1983). A Higgs-type symmetry-breaking mechanisms with general statistics is described in scalar ϕ^4 theories. It is shown that the minimum of the potential depends upon statistics and the parameter space is subdivided into separate regions, each with a particular statistics as a phase variable. In the model the authors describe, a phase diagram is constructed in parameter space, suggesting new type of phase transition between domains of different statistics. (3 refs.)

111898 Operator-product expansion and the asymptotic behavior of spontaneously broken field theories. C.Taylor, B.McClain (Dept. of Phys., MIT, MA, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1364-71 (15 Sept. 1983). The authors reexamine a recent study of the operator-product expansion in spontaneously broken scalar field theories. First, the asymptotic behaviour of the propagator in a spontaneously broken $\lambda\phi^4$ theory is calculated to lowest nontrivial order. The use of the operator-product expansion in the 'naive' vacuum, with operators developing nonvanishing vacuum expectation values, is found to correctly reproduce the usual perturbative analysis of the shifted theory when carried out to the same order. The renormalization-group improvement of this result is studied. They find that $\lambda_{g(2)}$, the renormalization-group coefficient of the operator ϕ^2 , is nonzero as first order in λ . This contradicts the results of the study of Gupta and Quinn. The generalization of this analysis to all Green's functions at all orders in perturbation theory is outlined. They argue that the renormalization-group improvement of the perturbation theory should yield the same answer for the two methods of calculating the asymptotic limit. Finally, they discuss the implications of this study for gauge theories. (13 refs.)

111899 Phase structure of the $O(N)$ vector model. W.A.Bardeen, M.Moshe (Fermi Nat. Accelerator Lab., Batavia, IL, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1372-85 (15 Sept. 1983). In a large- N analysis of the $O(N)\phi^4$ theory in four dimensions, the authors find that the $O(N)$ -symmetric lowest-lying state is a metastable state. The decay rate of this false vacuum into a broken-symmetry state is, however, suppressed [$\sim \exp(-N)$]. Nevertheless, at finite temperature, they find that above a critical temperature T_c the only existing phase is a broken-symmetry phase with $N-1$ Goldstone bosons. This phase reflects the intrinsic instability of this theory, and the large- ϕ_c structure indicates that the renormalization $\lambda\phi^4$. The only acceptable version of this theory is its regularized form which becomes a free-field theory as the regularization is removed. (27 refs.)

111900 Exact solution of the infrared problem. H.P.Stapp (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1386-418 (15 Sept. 1983). A simple but rigorous solution of the infrared problem is obtained. The basis of this solution is a factorization of the operator corresponding to the Feynman coordinate space plus all electromagnetic corrections to it into a product of two operators. The first is a unitary operator that represents precisely the contribution corresponding to classical electromagnetic theory. The second is a residual operator that is free of infrared problems. This factorization is exact: no soft-photon approximation, or any other approximation, is used. Both the unitary operator and the residual operator are expressed in simple forms amenable to rigorous mathematical analysis. The central technical results of this work, namely the exact yet simple organization of all contributions corresponding to classical physics into unitary factors, may have other important uses. (13 refs.)

111901 Self-dual gauge field, its quantum fluctuations, and interacting fermions. C.A.Flory (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1425-33 (15 Sept. 1983). The quantum fluctuations about a self-dual background field in $U(2)$ are computed. The background field consists of parallel and equal uniform chromomagnetic and chromoelectric fields. Determination of the gluon fluctuations about this field yields zero modes, which are naturally regularized by the introduction of massless fermions. This regularization makes the integrals over all fluctuations convergent, and allows a simple computation of the vacuum energy which is shown to be lower than the energy of the configuration of zero field strength. The regularization of the zero modes also facilitates the introduction of heavy test charges which can interact with the classical background field and also exchange virtual quanta. The formalism for introducing these heavy test charges could be a good starting point for investigating the relevant physics of the self-dual background field beyond the classical level. (12 refs.)

111902 New and old symmetries of the Maxwell and Dirac equations. V.I.Fushchich, A.G.Nikitin (Inst. of Math., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. J. Part. & Nucl. (USA), vol.14, no.1, p.1-22 (Jan.-Feb. 1983). Translation of: *Fiz. Elem. Chastits & At. Yadra (USSR)*, vol.14, no.1, p.5-57 (Jan.-Feb. 1983). [received: Sept. 1983]

The symmetry properties of Maxwell's equations for the electromagnetic field and also of the Dirac and Kemmer-Duffin-Petiau equations are analyzed. In the framework of a 'non-Lie' approach it is shown that, besides the well-known invariance with respect to the conformal group and the Heaviside-Larmor-Rainich transformations, Maxwell's equations have an additional symmetry with respect to the group $U(2) \otimes U(2)$ and with respect to the 23-dimensional Lie algebra A_{23} . The transformations of the additional symmetry are given by nonlocal (integro-differential) operators. The symmetry of the Dirac equation in the class of differential and integro-differential transformations is investigated. It is shown that this equation is invariant with respect to an 18-parameter group, which includes the Poincaré group as a subgroup. A 28-parameter invariance group of the Kemmer-Duffin-Petiau equation is found. Finite transformations of the conformal group for a massless field with arbitrary spin are obtained. The explicit form of conformal transformations for the electromagnetic field and also for the Dirac and Weyl fields is given. (64 refs.)

111903 Solitons and numerical experiments. V.G.Makhan'kov (Joint Inst. for Nuclear Res. Dubna, USSR).

Sov. J. Part. & Nucl. (USA), vol.14, no.1, p.50-75 (Jan.-Feb. 1983). Translation of: *Fiz. Elem. Chastits & At. Yadra (USSR)*, vol.14, no.1, p.123-80 (Jan.-Feb. 1983). [received: Sept. 1983]

The properties of one- and two-dimensional solitons are discussed. Particular attention is paid to qualitative results obtained by computer simulation. Where possible, a brief description of the computational method is given. (142 refs.)

111904 A method of approximate calculation of Feynman diagrams. I. O.I.Zav'yalov (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.23-31 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.38-51 (Jan. 1983). [received: Sept. 1983]

A method is proposed for elementary approximate calculation of massless Feynman amplitudes on the basis of the so-called loop tables of the corresponding diagrams. A new formulation of the theory is given in terms of the loop tables. (3 refs.)

111905 On field algebras in quantum theory with indefinite metric. K.Yu.Dadashyan, S.S.Khoruzhii (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.35-48 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.57-77 (Jan. 1983). [received: Sept. 1983]

The authors discuss the problem of formulating the algebraic approach directly in a space with indefinite metric. One of the possible ways of constructing a net of local field algebras $\mathcal{A}(O)$ in the J space (Krein space) is considered; it is based on the Bisognano-Wichmann formalism. The authors then establish a number of properties of 'WJ' algebras (weakly closed algebras with J involution and unit in the J space); the algebras $\mathcal{A}(O)$ belong to this class. The methods of the proof use generalizations of the fundamental concepts of Tomita-Takesaki theory for algebras with J involution. (22 refs.)

111906 On super-self-duality equations. I.V.Volovich (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.55-62 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.89-98 (Jan. 1983). [received: Sept. 1983]

Super-self-duality equations in supersymmetric Yang-Mills gauge theory are proposed. Solutions to them are found by means of super-twistors. (24 refs.)

111907 Use of the distribution function method in field theory. V.F.Tokarev (Inst. of Nuclear Res., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.70-8 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.111-23 (Jan. 1983). [received: Sept. 1983]

The distribution function method is used to study the Georgi-Glashow model in 2+1 space-time. Values are calculated for the quark-antiquark and gluon condensates. The masses of mesons and their wave functions taken at the origin are also calculated. The PCAC identity is proved in this model. (9 refs.)

111908 Calculation of many-loop diagrams of perturbation theory. N.I.Usyukina (Sci.-Res. Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.78-81 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.124-9 (Jan. 1983). [received: Sept. 1983]

Some identities are formulated for semi-unique vertices and semi-unique triangles that occur in the diagrams of perturbation theory with massless scalar particles. The use of these identities makes it possible to develop a reduction scheme by means of which the result can be obtained for many-loop diagrams without expansion in infinite series in Gegenbauer polynomials and without the use of the operation of differentiation, which leads to additional kinematic complications. As a result the calculation of many-loop diagrams of the perturbation theory is significantly simplified. (4 refs.)

111909 Quantum field theory models with a large number of colours and the statistical physics of disordered systems. I.Ya.Aref'eva (V.A. Steklov Math. Inst., Acad. of Sci., USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.97-101 (Jan. 1983). Translation of: *Theor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.154-60 (Jan. 1983). [received: Sept. 1983]

An analogy is noted between $N \times N$ matrix models of quantum field theory in the limit $N \rightarrow \infty$ and models of disordered spin systems in statistical physics. The replica method is used to establish the existence in the large N limit for the matrix model ϕ_D^4 of a new phase analogous to the spin glass phase in disordered spin systems. (14 refs.)

111910 Continuous regularizations in strong coupling expansions from a generalised inverse propagator method. J.P.Ader, B.Bonnier, M.Hontebeyrie, C.Meyers (Lab. de Phys. Theorique, Univ. de Bordeaux I, Gradignan, France).

Z. Phys. C (Germany), vol.19, no.3, p.233-9 (1983).

A strong coupling expansion is derived in terms of a generalized inverse propagator and is used to construct a regularization scheme which, for some regulators, differs from the canonical one. In particular, the Gaussian cut-off is shown to induce unbiased results, in contrast to a previous analysis using this regulator in the standard way. Several continuous and discrete regulations are then compared through a numerical example which suggests their equivalence. (11 refs.)

111911 Manifestly-covariant canonical formalism of Poincare gauge theories. I. General formulation. S.Hamamoto (Blackett Lab., Imperial Coll. London, London, England).

Z. Phys. C (Germany), vol.19, no.4, p.353-60 (1983).

Presents a general framework for manifestly-covariant canonical formulation of Poincare gauge theories. The author constructs a general class of action that is invariant under two kinds of BRS transformations—translation and internal Lorentz—and suitable for manifestly-covariant canonical quantization. This theory contains a great number of conserved quantities, which are investigated systematically. It is also pointed out that a canonical formulation of higher-derivative theories may be obtained as a limiting case of this framework. (14 refs.)

111912 Effect of the fourth-order Casimir invariants on $U_{6/4}$ and $U_{6/2}$ dynamical supersymmetries in nuclei and baryons. S.Iwao (Dept. of Phys. Coll. of Liberal Arts, Kanezawa Univ., Kanezawa, Japan).

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.2, p.55-9 (10 Sept. 1983).

The relative contribution arising from the fourth-order Casimir invariant in the subgroup B_2 is investigated for the dynamical super-symmetry $U_{6/4}$ proposed by Balantekin, Bars and Iachello (1981) for nuclei in the Os-Pt region, by making use of the data quoted by them. A similar method is applied to the linear and quadratic masses of baryons in the $U_{6/2}$ dynamical supersymmetry for hadrons suggested by the present author in order to find an additional clue. (11 refs.)

111913 Supersymmetry breaking by instantons. I.Affleck (Joseph Henry Labs., Princeton Univ., Princeton, NJ, USA), M.Dine, N.Seiberg.

Phys. Rev. Lett. (USA), vol.51, no.12, p.1026-9 (19 Sept. 1983).

It is shown that instantons generate a superpotential in supersymmetric QCD with N colors and $N-1$ flavors. (16 refs.)

111914 Hidden local supersymmetry in the supersymmetric particle action. W.Siegel (Dept. of Phys., Univ. of California, Berkeley, CA, USA).

Phys. Lett. B (Netherlands), vol.128B, no.6, p.397-9 (8 Sept. 1983).

The action for a massless supersymmetric particle in terms of superspace coordinates $x^\mu(\tau)$ and $\theta^\mu(\tau)$ is found to be invariant under a local supersymmetry which allows half of θ to be gauged away. (4 refs.)

111915 Domain walls. II. Baryon-number generation. B.Holdom (Dept. of Phys., Stanford Univ., Stanford, CA, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1419-24 (15 Sept. 1983).

Domain walls present in the early universe due to a spontaneous breakdown of charge conjugation can leave behind net baryon number. $SU(2)$ instantons provide baryon nonconservation and the proton is effectively stable. Density

perturbations (on scales large enough for galaxy formation) and monopole suppression can occur if walls dominate the energy density. Mechanisms for wall removal are discussed. (11 refs.)

111916 One loop corrections of the fermion masses and the CP-violation calculations of the strong and weak interactions. Li Chong-sheng (Normal Univ. of East China, China), Hu Shi-ke.

Phys. Eng. Fortis & Phys. Nucl. (China), vol.7, no.3, p.333-41 (May 1983). In Chinese.

In a renormalizable gauge theory of spontaneously broken symmetry, using the path integral method, the authors derive a formula for calculating the one loop corrections of the effective potentials in the general case and the expressions for the one loop corrections of the fermion masses. Using these results, they calculate the contributions of the one loop corrections of the fermion masses to the QCD CP-violation, and obtain more general results than V. Goffins (1980), they also discuss the weak CP-violation. (8 refs.)

111917 A $SU(3)$ theory for leptons, quarks and electroweak interactions. R.Montemayor (Dept. de Fisica, Facultad de Ciencias, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), M.Moreno.

Rev. Mex. Fis. (Mexico), vol.29, no.3, p.369-85 (May 1983). [received: Sept. 1983]

The gauged version of the $SU(3)$ model for vector interactions of leptons and quarks is developed. After reviewing the main features of the global-spontaneously broken $SU(3)$ scheme for leptons, the authors conclude that the gauged version of the theory is incompatible with phenomenology. When the quark sector is included in the picture the problems of gauge theory are overcome. This is so provided that the quark and lepton mass matrices cannot be simultaneously diagonalized. The scheme therefore presents a natural link of the electroweak angles, the existence of two fermion multiplets and the gauge structure of the theory. (10 refs.)

111918 Non-linear representations of extended supersymmetry with central charges. S.Ferrara (CERN, Geneva, Switzerland), L.Maiani, P.C.West.

Z. Phys. C (Germany), vol.19, no.3, p.267-73 (1983).

A new class of nonlinear representations of N extended supersymmetry is found. These nonlinear realizations extend the Volkov-Akulov nonlinear realizations to include central charges which can also be nonlinearly realized. The general construction of the corresponding nonlinear Lagrangians is presented. The coupling to N extended supergravity provides the simultaneous occurrence of the Higgs and super-Higgs effects. The corresponding formulae for spin- $3/2$ gravitinos and spin-1 vector boson masses are derived. (15 refs.)

111919 Lepton number violation with quasi-Dirac neutrinos. J.W.F.Valle, M.Singer.

Report RL-83-018, Rutherford Appleton Lab., Chilton, Oxon., England (March 1983), 24 pp.

Investigates lepton number violation in weak interactions with massive Dirac neutrinos. In the framework of a simple $SU(3)_L \times U(1)$ electroweak model the authors find that neutrinos naturally acquire only Dirac masses at tree level, and for an odd number of lepton families, one neutrino remains massless. After a spontaneous breakdown of symmetry they find that the $SU(2) \times U(1)$ effective theory has lepton number violating currents which couple to the standard gauge bosons. Flavor conserving $|\Delta I|=2$ processes such as neutrinoless double β decay are forbidden in the simplest model, but processes such as $\mu^- + (A, Z) \rightarrow e^+ + (A, Z-2)$ and $K^- \rightarrow \pi^+ e^- \mu^-$ are allowed. (11 refs.)

11.50 DISPERSION RELATIONS AND SUM RULES

111920 A P-wave sum rule and quark confinement. M.G.Olsson (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA). *Phys. Rev. D (USA)*, vol.28, no.5, p.1223-4 (1 Sept. 1983). A sum rule valid to order $(v/c)^2$ for an arbitrary spin-dependent interaction relates the P-wave hyperfine splitting to the spin-orbit contribution due to confinement. A measurement of a 3P_1 level when combined with the spin-triplet splittings would provide an insight into the Lorentz structure of the confinement interaction. (11 refs.)

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

12.10 UNIFIED FIELD THEORIES AND MODELS

111921 Magnetic bremsstrahlung of a neutrino pair in the Weinberg-Salam model, taking account of the polarizational states of the electron. I.M.Ternov, V.N.Rodionov, A.I.Studenikin (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.37, no.5, p.122-5 (1982). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.37, no.5, p.104-7 (1982). The magnetic bremsstrahlung of a neutrino pair is considered, taking account of the initial or final electron polarization within the framework of the Weinberg-Salam weak-interaction model. In the case of ultrarelativistic particle

energies, the transition to crossed fields is made, and expressions are obtained for the probability of the process in the two limiting cases: $\chi = \text{Hep}_0/m^3 \ll 1$ and $\chi \gg 1$. (7 refs.)
111922 Elimination of unitarily nonequivalent vacua in supersymmetric grand unified theories by gravity. J.Kubo (Inst. fur Theoretische Phys., Univ. Dortmund, Dortmund, Germany), S.Sakakibara. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.389-92 (8 Sept. 1983). In globally supersymmetric grand unified theories, there may be unitarily nonequivalent vacua which are not present in ordinary theories, reflecting the invariance of the Higgs potential under the complex extension of the gauge group. The authors show that such vacua are eliminated in the presence of $N=1$ supergravity coupling, if local supersymmetry is broken and the cosmological constant vanishes. (9 refs.)
111923 Low energy tests of unification. S.M.Barr (Phys. Dept., Univ. of Washington, Seattle, WA, USA). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.400-2 (8 Sept. 1983). The author points out that there may be simple low energy tests of grand unification. In particular in the event that there turn out to be multiple light Z^0 bosons the consequent deviations from standard model neutral current scattering predictions must satisfy certain very simple relations if the world has an $SU(5)$ symmetry (or some larger symmetry). These relations are true even in the Z^0 bosons mix in arbitrarily complicated ways. (4 refs.)
111924 The weak mixing angles in gauge models with horizontal symmetry—a new approach to quark and lepton masses. Z.G.Berezhiani (Inst. of Phys., Acad. of Sci., Tbilisi, Georgian SSR). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.99-102 (15 Sept. 1983). A generation mechanism of the quark and lepton masses in gauge models with horizontal symmetry is proposed. It is based on the mixing of quark-lepton families with heavy horizontal fermions, acquiring large masses directly after breaking of horizontal symmetry. A simple implementation of this mechanism for the $SU(3)_H \times SU(2)_L \times SU(2)_R \times U(1)$ model is given. The following results are obtained for the Kobayashi-Maskawa mixing angles: $s_1 \approx (m_d/m_s)^{1/2}$, $s_2 \approx (m_c/m_t)^{1/2}$, $s_3 \approx (m_b/m_\tau)^{1/2}$. The extension of this mechanism to GUTs is discussed. (18 refs.)
111925 A three-dimensional model with a kink and a Higgs mechanism. F.Gurse, C.-H.Tze (Phys. Dept., Yale Univ., New Haven, CT, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.205-18 (22 Sept. 1983). In a conformally invariant scalar field theory on the three-sphere, a scalar-spinor theory with Yukawa interaction, Higgs mechanism and fixed couplings is shown to arise from the curved geometry. This model admits a threefold description and an exact one-link solution. Implications are discussed. (23 refs.)
111926 Monopole chemistry. T.W.Ruijgrok, J.A.Tjon (Inst. voor Theoretische Fysica, Utrecht, Netherlands), Tai Tsun Wu. *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.209-12 (22 Sept. 1983). Possible chemical binding of the magnetic monopole is discussed. The interaction of a monopole with a hydrogen atom is investigated in the Born-Oppenheimer approximation with the electron described by the Dirac equation. The effective potential between the monopole and the proton is determined together with the resulting bound states. (14 refs.)
111927 A grand unified composite model. D.Gonzales (Dept. of Phys., MIT, Cambridge, MA, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.213-17 (22 Sept. 1983). If certain unusual assumptions about chiral symmetry breaking and dynamical mass generation are valid the gauge hierarchy problem is solved naturally and all elementary particle forces are unified into a single semi-simple gauge group. Three ordinary and two exotic families of fermions exist below 1 TeV. (13 refs.)
111928 The Lipkin-Weisberger-Peshkin difficulties in abelian and non-abelian gauge theories. M.Kamata (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.218-22 (22 Sept. 1983). The question is raised on the validity of the usual derivation of the Lipkin-Weisberger-Peshkin (LWP) difficulty. It is shown that the LWP difficulty can be derived legitimately in the framework of the Wu-Yang formalism. A non-abelian version of the LWP difficulty is presented in a Wu-Yang solution of the pure $SU(2)$ Yang-Mills theory, showing a failure of the Jacobi identity at one point through the term $-i4\pi(\vec{r})\delta^3(x)$. A nonrelativistic treatment of the $SU(2)$ doublet particle with spin 1/2 around this solution is given. Some remarks are made also on a possible LWP difficulty in the 't Hooft-Polyakov monopole. (16 refs.)
111929 Rapid phase transitions in local SUSY GUT. C.Kounnas, D.V.Nanopoulos, M.Quiros (CERN, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.223-8 (22 Sept. 1983). The authors propose a class of $SU(5)$ local SUSY GUTs exhibiting the following properties: (i) local SUSY and the $SU(5)$ gauge group are spontaneously broken when a field in the adjoint representation of $SU(5)$ takes a VEV of the order of the grand unification scale M_X ; (ii) the non-zero VEV of that field follows because of finite temperature effects independently of possible confining properties of the GUT; (iii) the phase transition is extremely fast and the critical temperature is of the order of 10^9 GeV; and (iv) the monopole production is suppressed. (20 refs.)
111930 The existence of a dual transformation in the Migdal-Kadanoff recursion equations. S.Matsuda (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.229-33 (22 Sept. 1983). A dual transformation is found to exist between the Migdal (M-) and Kadanoff-Migdal (K-) recursion relations. Consequently, a generic form of the Z_L -functionals can be obtained to describe both the M- and K-approximations in a single unified analytic expression. The proof for the claim is given and some implications of the discovered dual transformation are discussed. (10 refs.)
111931 Left-right symmetry, K_L - K_S mass difference, and heavy quarks. M.Denis (Inst. de Phys. Theorique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium). *Phys. Rev. D (USA)*, vol.28, no.5, p.1219-22 (1 Sept. 1983). Shows that the lower limit for M_R , the mass of the right-handed bosons, computed from the K_L - K_S mass difference in an $SU(2)_L \times SU(2)_R \times U(1)$ model, strongly depends on the mass of the top quark and on the quark mixing angles. For reasonable choices of these parameters, $\beta = (M_L/M_R)^2$ can be as large as $1/6$. (10 refs.)
111932 Neutrino-induced pion production and proton decay. D.Rein (Phys. Inst., RWTH Aachen, Aachen, Germany). *Phys. Rev. D (USA)*, vol.28, no.7, p.1800-1 (1 Oct. 1983). A quantitative account of the reaction $\bar{\nu}_e + p \rightarrow e^+ + n + \pi^0$ is given and its implications with regard to proton-decay experiments are discussed. (10 refs.)

111933 Proton decay catalyzed by a monopole: the ratio of e^+ to $e^+\pi^0$ final states. C.Schmid (Inst. fur Theoretische Phys., Eidgenossische Tech. Hochschule, Zurich, Switzerland). *Phys. Rev. D (USA)*, vol.28, no.7, p.1802-3 (1 Oct. 1983). The author computes the ratio $\sigma(p+M \rightarrow M+e^++\pi^0) : \sigma(p+M \rightarrow M+e^+)$ using pole dominance for P-wave pion emission from the proton and soft-pion techniques for S-wave pion emission. In this paper the author neglects the form factor of the baryon-number-violating condensate, and concludes that the purely hadronic factors together with phase space enhance the e^+ over the $e^+\pi^0$ final state by a factor of $\simeq 4$. (3 refs.)

111934 Lepton spectroscopy. F.W.Bullock (Dept. of Phys. & Astron., Univ. of Coll. London, London, England), R.C.E.Devenish. *Rep. Prog. Phys. (GB)*, vol.46, no.9, p.1029-191 (Sept. 1983). The complete body of knowledge of the lepton spectrum as it is known today is presented and critically examined. Whilst the emphasis is primarily on the experimental determination of leptonic properties, the authors also summarise the many theoretical endeavours that have enriched and guided the field, and continue so to do. Complete accounts are given of the current situation on neutrino mass determination, on neutrino oscillations and on the properties of the tau and search for its associated neutrino. The subject of lepton conservation is discussed and all the experimental evidence for non-conservation collected together. The search for leptons other than those belonging to the three familiar generations is reviewed. Finally, a brief account is given for the limits on leptonic properties imposed by cosmological arguments. (560 refs.)

111935 Conditions of local gauge and relativistic invariance of universal nonlinear first-order equations in the theory of fundamental interactions. A.A.Babich, V.I.Kuvshinov, F.I.Fedorov (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1015-17 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1093-7 (Dec. 1982). [received: Sept. 1983] The authors formulate a method for obtaining an explicit form of matrices $(\alpha^a\partial_\mu + \alpha^a\Psi + (g/2)\Lambda\Psi\Psi=0$ from the requirement that the equation be invariant under local gauge and Lorentz transformations for a given structure of the unified field (Ψ_A). They state the form of these matrices for electromagnetic and strong interactions as well as for the unified Weinberg-Salam theory and the grand-unification scheme (without the Higgs mechanism). (11 refs.)

111936 Chiral Lagrangian calculation of nucleon decay modes induced by $d = 5$ supersymmetric operators. S.Chadha, M.Daniel. **Report RL-83-056**, Rutherford Appleton Lab., Chilton, Oxon., England (June 1983), 18 pp. Considers the general baryon number violating operators which are produced by dressing the supersymmetric dimension five operators by gaugino exchanges. The authors then use chiral dynamics to calculate the widths for the decay modes $p \rightarrow K^+ \bar{\nu}_d$, $K^0 e^+ \bar{\nu}_d$, and $n \rightarrow K^0 \bar{\nu}_d$. The resulting branching ratios are rather sensitive to the precise admixture of the various baryon number violating operators involved. In particular the decay mode $p \rightarrow K^+ \bar{\nu}_d$ is generally dominant in qualitative agreement with previous quark model results. (17 refs.)

111937 Towards a realistic SUGRA-GUT. L.E.Ibanez, G.G.Ross. **Report RL-83-060**, Rutherford Appleton Lab., Chilton, Oxon., England (June 1983), 11 pp. Constructs a grand unified model based on $(N=1 \text{ local supersymmetry}) \times SU(5)$ in which the only fundamental mass scale is $0(M_{\text{Planck}})$. The model predicts $\sin^2 \theta_w = 0.22$, and has two new scales induced by gravitational effects $M_X \approx M_{\text{Planck}} / \sqrt{8\pi}$, $M_{\text{SUSY}} \approx 10^{11}$ GeV. $SU(2) \times U(1)$ is broken by radiative corrections for a top quark mass in the range $30 < m_t < 130$ GeV and the colour triplets of Higgs scalars are automatically superheavy. (12 refs.)

111938 $SU_3 \times SU_2 \times U_1$ next to leading corrections for proton decay in SU_5 model. M.Daniel, J.A.Penarrocha. **Report RL-83-042**, Rutherford Appleton Lab., Chilton, Oxon., England (Feb. 1983), 57 pp. Computes in the standard model of $SU_3 \times (SU_2 \times U_1)$ with massless quarks and leptons the two-loop anomalous dimensions of the four-fermion operators relevant to proton decay in processes involving (u,d,e,ν_e) . The calculation is carried out by the use of dimensional reduction, a variant of dimensional regularisation. The aim is to give a complete calculation within the SU_5 GUT model of the next to leading enhancement-suppression factor for nucleon decay due to renormalisation effects arising from hard gluons, W 's and B 's in processes which involve (u,d,e,ν_e) . It turns out that the result is sensitive to the ratios $x_i = M_{H(i)} / M_X$ where $M_{H(i)}$ are the masses of the twelve superheavy Higgs scalars in the 24 multiplet which breaks $SU_5 \rightarrow SU_3 \times SU_2 \times U_1$. (20 refs.)

111939 Unification of weak and electromagnetic forces. D.Atkinson (Inst. for Theoretical Phys., Groningen, Netherlands). Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.35-54 The author introduces the modern theory of the electroweak interaction, and applies it to β -decay. Quantum electrodynamics is reviewed, in a fully relativistic notation, and the theory is illustrated by a calculation of Bhabha scattering in lowest order. A treatment of the weak interaction, in which the photon is replaced by the charged W -boson, is then applied to electron-neutrino scattering. The leptonic sector of the $SU(2)_L \times U(1)$ electroweak theory is introduced; and the spontaneous symmetry-breaking phenomenon is explained in detail. Electron-neutrino scattering is briefly reconsidered. The semileptonic electroweak interactions, in which quarks as well as leptons interact, are treated in the manner of Glashow, Iliopolous and Maiani (1970), in which the charmed quark is used to suppress unwanted strangeness-changing neutral current effects. The application here is to nuclear β^+ -decay, in which a distinction is made between the pure Fermi and pure Gamow-Teller cases. An extension of the above theory to a left-right symmetrical $SU(2)_L \times SU(2)_R \times U(1)$ model, in which low-energy parity violation is a consequence of spontaneous symmetry breakdown, is explained; and β^+ -decay is reconsidered in this light. The result of a recent Groningen experiment that tests this theory is given. (5 refs.)

111940 Search for neutrino masses and oscillations. P.Vogel (California Inst. of Technol., Pasadena, CA, USA). Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.203-22 The author discusses the various aspects of the neutrino mass problem. This has been an interesting story for several reasons. First, if neutrinos are massive one has to modify the 'standard' (Weinberg-Salam-Glashow) theory of weak interactions. A nonvanishing neutrino mass would represent a strong argument for grand unification with its tremendous mass scale. Second, the search for neutrino mass involves an interplay of very different, and often

isolated, subfields of physics. The author mentions astrophysics, particle physics, nuclear physics, and even geophysics. (34 refs.)

12.20 MODELS OF ELECTROMAGNETIC INTERACTIONS

111941 Random electrodynamics of nonlinear system. I. Quartic anharmonic oscillator. S.Sachidanandam, I.V.V.Raghavacharyulu (Bhabha Atomic Res. Centre, Bombay, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.408-12 (July 1983). A successful extension of the classical techniques of random electrodynamics to nonlinear microsystems is still not obtained in the literature. A beginning is made in this direction in this paper. The authors study the quartic anharmonic oscillator as an illustrative example. By extending one of the approximation methods employed in the study of deterministic nonlinear systems to stochastic nonlinear systems, properties quite close to those given by the quantum mechanical description are obtained. The results partly dispel the doubts raised by Claverie et al. (1980) in the validity of random electrodynamics in the description of nonlinear microsystems. (17 refs.)

111942 Phenomenological electromagnetism with magnetic poles. G.Calucci (Istituto di Fisica Teorica, Univ. di Trieste, Trieste, Italy). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.16, p.573-5 (20 Aug. 1983). A qualitative discussion of the feature of the phenomenological electromagnetism in the presence of magnetic poles is presented together with the possible suggestion that one can derive for the combined renormalization of charges and poles. (7 refs.)

12.20F Experimental tests of quantum electrodynamics

111943 An exotic decay of orthopositronium? J.Cleymans, P.S.Ray (Dept. of Theoretical Phys., Univ. of Bielefeld, Bielefeld, Germany). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.16, p.569-72 (20 Aug. 1983). A discrepancy is apparent between the higher-order QED calculations and a recent experiment on the decay rate of the orthopositronium. It is conjectured here that this can be due to a possible pseudoscalar interaction of the electron-positron field. (4 refs.)

12.30 MODELS OF WEAK INTERACTIONS

111944 Neutral currents in the gage model $SU(3)_F \times U(1)$. M.N.Dubinin (Dept. of High Energy Phys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.108-10 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.90-2 (1983). A model of electrically weak interactions satisfying presently known experimental data on the process, neutral currents into account, is considered. Two neutral gage bosons with masses of the same order are introduced in the model. (5 refs.)

111945 Higher order exchange contributions to $\Delta S=2$ amplitudes in a dynamical scenario for weak interactions. M.A.B.Beg (Rockefeller Univ., New York, NY, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.113-16 (15 Sept. 1983). Higher order contributions to $\Delta S=2$ amplitudes, involving the exchange of two gauge bosons are calculated in the framework of a recently described hypercolor-based dynamical scenario for weak interactions. Also calculated are quark masses in a manner that avoids any reference to scaling relationships that relate different QCD-like theories. The result that emerges is that one may generate the masses of the heavier quarks yet keep these contributions to $\Delta S=2$ at a level comparable to that in the canonical theory. The paper concludes with a description of a possible mechanism for generating lepton masses. (8 refs.)

Lepton number violation with quasi-Dirac neutrinos See Entry 111919

Physical null zones and radiation representation See Entry 111956

12.35 COMPOSITE MODELS OF PARTICLES

111946 Remarks on the possible origin of quark charges. K.Koike (Div. of Principles of Natural Sci., Kagawa Univ., Takamatsu, Japan). *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.1, p.1-6 (3 Sept. 1983). The problem concerning the origin of fractional quantum numbers is summarized. Then, possibilities to resolve this problem are investigated. (17 refs.)

A SU(3) theory for leptons, quarks and electroweak interactions See Entry 111917

The weak mixing angles in gauge models with horizontal symmetry—a new approach to quark and lepton masses See Entry 111924

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

111947 Supercomplementarity in massless supersymmetric QCD. T.R.Taylor (Fermi Nat. Accelerator Lab., Batavia, IL, USA). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.403-6 (8 Sept. 1983). The presence of at least one supersymmetric phase is established for the strongly interacting SU(N) gauge theory with *n* flavors of massless matter in the *N*+*N* representation of the gauge group. (6 refs.)

111948 A measurement of the string tension near the continuum limit. G.Parisi (Dipartimento di Fisica, Univ. di Roma II, Rome, Italy), R.Petronzio, F.Rapuno. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.418-20 (8 Sept. 1983). The string tension has been measured at $\beta=6$ in the quenched approximation using a new technique for minimizing the statistical errors. (12 refs.)

111949 A simple interpolation for high and low momentum transfers in QCD. J.A.Mignaco, I.Roditi (Centro Brasileiro de Pesquisas Fisicas, CBPF/CNPq, Rio de Janeiro, Brazil). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.445-7 (8 Sept. 1983). It is shown that a simple rational approximation for the function $\beta(g)$ of the renormalization group provides a useful expansion parameter for the perturbative regime in QCD and, simultaneously, allows for confinement in the functional integral approximation to this problem. (14 refs.)

111950 Consequences of gluon condensation. J.Chakrabarti (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.448-52 (8 Sept. 1983). The author argues that the present estimates of gluon condensation may indicate that the bound states of gluons could be light. He pursues this line of reasoning to see if such a possibility is phenomenologically consistent. (12 refs.)

111951 The effective lagrangian for supersymmetric QCD. H.P.Nilles (CERN, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.103-7 (15 Sept. 1983). The author constructs an effective lagrangian for supersymmetric QCD with *N* colours and *M* flavours including the gauge fermion bound state. This lagrangian predicts the breakdown of supersymmetry for *M*<*N* in its massless limit, whereas for *M*≥*N* supersymmetry and certain chiral symmetries remain unbroken. (12 refs.)

111952 On the breakdown of chiral symmetries in supersymmetric OCD. J.-M.Gerard, H.P.Nilles (CERN, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.243-7 (22 Sept. 1983). The authors investigate the breakdown of chiral symmetries in supersymmetric QCD with *N* colours and *M* flavours, using anomaly consistency conditions and an effective lagrangian approach. For *M*<*N*, they obtain completely broken chiral symmetries. In the case of *M*>*N*, however, one needs at least unbroken SU(*N*)_V×SU(*M*−*N*)_R×SU(*M*−*N*)_L×U(1)×U(1) to arrive at a consistent picture. (19 refs.)

111953 Relationship between proper time and dimensional regularization of QCD. D.Sen (Dept. of Phys., Princeton Univ., Princeton, NJ, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.248-50 (22 Sept. 1983). The gluon propagator is renormalized to one loop in two different ways—dimensional regularization and by introducing a proper time parametrization. By comparing the two results, the ratio of the proper time mass parameter to the minimal subtraction mass is calculated. This is a renormalization-point independent and therefore physically interesting number. Using this ratio, the scale mass appearing in the one-loop constant abelian field effective action is calculated in terms of the standard QCD scale mass $\Lambda_{\overline{MS}}$. (7 refs.)

111954 A dynamical model for the gluon distribution function. Zhu Wei (Phys. Dept., Normal Univ. of East China, Shanghai, China), Shen Jian-guo. *Phys. Energy. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.316-22 (May 1983). In Chinese. The forms of the gluon distribution function at different *Q*² are discussed with the aid of the three-quark model associated with dynamical calculations of QCD (the LLA approximation). The Buras-Gaemers parametrization is improved and the gluon distribution functions are obtained. (12 refs.)

111955 Hadronization of quark systems. J.Dias de Deus, M.Pimenta (CFMC-INIC, Lisboa, Portugal). *Z. Phys. C (Germany)*, vol.19, no.4, p.365-9 (1983). Hadronization in simple models of quark systems is discussed with emphasis on the combinatorial aspects. The number *N*_q of quarks and the number *N*_c of colours are the relevant variables. In one-dimension and in the meson and baryon sector the problem is completely soluble. When multi-quark hadrons are included an iterative procedure still allows a complete solution. Higher dimensions are difficult to treat but global hadronization, without dimensionality constraints, is again soluble. As a general result the baryon/meson ratio is, for large quark densities, rather large, $\approx 1/3$, and may grow without limit as *N*→∞. (3 refs.)

12.35E Applications of quantum chromodynamics to particle properties and reactions

111956 Physical null zones and radiation representation. G.Passarino (Linear Accelerator Center, Stanford Univ., Stanford, CA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.265-88 (12 Sept. 1983). General conditions for reconstructing physical null radiation zones in single photon tree amplitudes are given. The systematic analysis has been carried out using invariant quantities. For arbitrary values of masses and charges these zones are always smaller than in the massless and equal charges case. As an application the radiative W boson decay into heavy quarks is studied. This process turns out to be a rather sensitive test of the current quark masses *m_q*(*M_W*²), as well as of the $\bar{q}qW$, $q\bar{q}\gamma$ and *W*⁺*W*[−] γ vertices. This is due to the presence of a null line in the photon phase space with a location which strongly depends on *m_q*. A recently proposed radiation representation for single photon tree amplitudes is analyzed. Explicit examples are given for a number of cases including fermion and vector boson lines. (7 refs.)

111957 A neutron electric dipole moment from supersymmetric QCD. M.J.Duncan (Dept. of Theoretical Phys., Univ. of Oxford, Oxford, England). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.289-307 (12 Sept. 1983). Supersymmetric QCD naturally contains CP-violating interactions which can contribute to a neutron electric dipole moment. An analysis of the two-loop graphs results in a non-zero EDM whose magnitude is estimated and found to be compatible with experiment. (19 refs.)

111958 Glueball mass calculations on an array of computers. E.Brooks,III, G.Fox, S.Otto, M.Randeria (Caltech High Energy Phys. Group, Pasadena, CA, USA), B.Athas, E.DeBenedictis, M.Newton, C.Seitz. *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.383-400 (5 Sept. 1983). The authors have calculated the mass of the 0⁺ glueball in SU(2) pure gauge theory in 4 dimensions with very high statistics. The computation was done on an array of microprocessors with nearest-neighbour connections which run concurrently. They discuss, in detail, the implementation of the pure gauge algorithm for SU(2) and SU(3) and also the algorithm for calculating arbitrarily shaped Wilson loops on the array. The extension of these algorithms to the inclusion of dynamical fermions is also discussed. Finally, they present the results of the variational calculation of glueball masses which are in agreement with published results. (27 refs.)

111959 Static hadron properties in lattice QCD. C.Bernard, T.Draper, K.Olynyk (Dept. of Phys., Univ. of California, Los Angeles, CA, USA), M.Rushton. *Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands)*, vol.B220(FS8), no.4, p.508-32 (5 Sept. 1983). The authors calculate hadron masses and magnetic moments in the quenched approximation to lattice QCD, using Monte Carlo and Gauss-Seidel methods. For the mass computation, they have quite good statistics; in addition, the lattice is long enough in the 'time' direction to make a rather clear separation of the lowest lying hadrons from their radical excitations. They find mass ratios which are far from the experimental values; there is evidence that this may be due to the small spatial size of the lattice (which, however, is as large or larger than that used in most previous computations). For the magnetic moments, the situation is somewhat better, presumably because the moment calculation is really a qualitative test of the constituent quark model. (23 refs.)

111960 Quantum chromodynamics radiation and KNO scaling. G.Pancheri, Y.N.Srivastava (Lab. Nazionali, INFN di Frascati, Frascati, Italy). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.433-8 (8 Sept. 1983). The authors obtain the KNO scaling function from the parton model and QCD, after averaging the microscopical system of quarks and gluons over the hadronic matter coordinates. Energy conservation and soft-gluon emission distribution functions are used to derive an expression which exhibits scaling violations and fits the charged multiplicity very well. (12 refs.)

111961 Local quark-hadron duality and nucleon form factors in QCD. V.A.Nesterenko, A.V.Radyushkin (Lab. of Theoretical Phys., JINR, Dubna, USSR). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.439-44 (8 Sept. 1983). Quark-hadron duality is incorporated to estimate the non-perturbative $O(\alpha_s^0)$ -contribution to the nucleon form factors $G_{E,N,M}(t)$. For $1 < t < 20 \text{ GeV}^2$ the results are in satisfactory agreement with the existing data. This means that the observed dipole behaviour of $G^N(t)$ has nothing to do with the short distance dynamics. (16 refs.)

111962 The behaviours of $F_2^{ep}(X, Q^2)$ - $F_2^{en}(X, Q^2)$ and the scale-breaking parameter. Shen Qi-xing, Wu Ji-min, Lu Jing-xian, Zhao Pei-ying (Inst. of High Energy Phys., Acad. Sinica, Peking, China). *Phys. Energy. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.301-8 (May 1983). In Chinese. The scale-breaking parameter $\partial F_2^{ep}(X, Q^2)/\partial \ln Q^2$ of non-singlet component $F_2^{ep}-F_2^{en}$ and some other quantities in the electro-production process are discussed using the analytic expression for the distribution function of valence quarks in hadrons up to the leading log approximation. Comparisons with data are also given. (15 refs.)

111963 The QCD behaviour of the XF₃(X, Q²) up to the leading log in the neutrino deep-inelastic processes. Shen Qi-xing, Wu Ji-min, Lu Jing-xian, Zhao Pei-ying (Inst. of High Energy Phys., Acad. Sinica, Peking, China). *Phys. Energy. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.309-15 (May 1983). In Chinese. The QCE behaviour of the structure functions XF₃ in the neutrino deep-inelastic processes are discussed using the analytic expression for the distribution function of valence quarks in hadrons up to the leading log approximation. The theoretical predictions are in good agreement with experimental data. The error arising from an approximation in solving the A-P equation is discussed. The calculation shows that relative error remains smaller than 1% even in the case of *Q*²=200 GeV and *X*=0.1. (12 refs.)

111964 Analysis of hard inclusive processes in quantum chromodynamics. A.V.Radyushkin (Joint Inst. For Nuclear Res., Dubna, USSR). *Sov. J. Part. & Nucl. (USA)*, vol.14, no.1, p.23-49 (Jan.-Feb. 1983). Translation of: *Fiz. Elem. Chastits & At. Yadra (USSR)*, vol.14, no.1, p.58-122 (Jan.-Feb. 1983). [received: Sept. 1983]
The two simplest inclusive processes, namely, e^+e^- annihilation into hadrons and deep inelastic lepton-hadron scattering, are used to illustrate one of the approaches to the investigation of hard processes in QCD based on systematic analysis of the asymptotic behavior of the Feynman diagrams in the α representation. (131 refs.)

111965 Constituent quark model for hadron-hadron collisions and multiplicity distributions. F.Takagi (Dept. of Phys., Tohoku Univ., Sendai, Japan). *Z. Phys. C (Germany)*, vol.19, no.3, p.213-20 (1983).
Mean charged multiplicities and multiplicity distributions in proton-proton collisions at high energies are calculated using a class of models including constituent quark model (CQM), quark-parton model (QPM) and leading proton model (LPM). QPM is found to have an unrealistic feature about the mean multiplicity of low mass central components. LPM with the universality hypothesis that the central component in p - p collisions has the same distribution as the final state in e^+e^- annihilation into hadrons at the same effective energy tends to predict too narrow multiplicity distributions. CQM with a simple parametrization of inelastic quark-quark collisions can explain most easily and most naturally the multiplicity distributions in both p - p and π - p collisions, including their approximate KNO scaling. Also studied during the course of those analyses are the conditions under which an exact KNO scaling is realized. (29 refs.)

111966 Quark statistics and hadron spectra in e^+e^- annihilation and deep inelastic scattering. V.V.Anisovich, M.N.Kobrinisky (Leningrad Nuclear Phys. Inst., Leningrad, USSR), P.E.Volkovitski. *Z. Phys. C (Germany)*, vol.19, no.3, p.221-31 (1983).
Predictions of quark combinatoric calculus (QCC, alias quark statistics) for baryon-to-meson ratio in quark jets are compared with hadron production data e^+e^- annihilation and deep inelastic μp collisions. It is shown that charm production data in e^+e^- annihilation provide the impressive evidence confirming QCC which predicts that in the jet formed by c -quark the probability to produce charmed baryons is equal to 1/3. The possibility of successful description of secondary hadron spectra $(s/\beta).d\sigma(e^+e^-\text{-hadrons})/dx_E$ in the region $0.2 < x_E < 0.9$ in the framework of QCC approach is demonstrated. It is also shown that QCC agrees reasonably well with μp data for p/h^+ and p/h^- ratios in the current fragmentation region. (51 refs.)

111967 On the influence of hadronic decay on the properties of hadrons. E.van Beveren, C.Dullemond, T.A.Rijken (Inst. for Theoretical Phys., Univ. of Nijmegen, Nijmegen, Netherlands). *Z. Phys. C (Germany)*, vol.19, no.3, p.275-81 (1983).
In a multichannel treatment of the $q\bar{q}$ -system it is shown that the impact of decay on the spectra, and wavefunctions of hadrons is substantial. Some consequences for potential models are worked out in detail. The authors conclude that an 'equivalent' confining $q\bar{q}$ -potential to be used in an effective single-channel treatment might deviate significantly from the $q\bar{q}$ -potential in a realistic multichannel treatment. (15 refs.)

111968 The use of finite energy sum rules for the description of the hadronic properties of QCD. N.V.Krasnikov (CERN, Geneva, Switzerland), A.A.Pivovarov, N.N.Tavkhelidze. *Z. Phys. C (Germany)*, vol.19, no.4, p.301-9 (1983).
The authors use finite energy sum rules, taking into account nonperturbative corrections, for the calculation of hadron masses within QCD. As a rule, they obtain reasonable agreement with experimental data. They also estimate the proton lifetime in the $SU(5)$ model to be $\tau_p = 10^{28} (M_x/10^{14} \text{ GeV})^4$ years. (23 refs.)

111969 Calculation of the glueball mass spectrum of $SU(2)$ and $SU(3)$ non-abelian lattice gauge theories. I. Introduction and $SU(2)$. K.Ishikawa (City Coll., City Univ. of New York, New York, NY, USA), G.Schierholz, M.Teper. *Z. Phys. C (Germany)*, vol.19, no.4, p.327-52 (1983).
The authors describe a direct method for calculating the glueball mass spectrum in QCD and apply it to the $SU(2)$ non-Abelian gauge theory. The method involves the application of Monte Carlo methods to the lattice regulated theory. They calculate the masses of states of various spins and parity. They check for the absence of finite size effects, for the desired renormalization group dependence and that the higher mass states do not merely reflect a continuum cut. Finally they repeat the calculation in the 'Hamiltonian' limit and in the high temperature deconfining phase of QCD. (44 refs.)

12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

111970 Leading log approximation for parton showers. M.P.Shatz (California Inst. of Technol., Pasadena, CA, USA). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.218-28 (12 Sept. 1983).
The author corrects and extends the leading log parton shower formalism, which is widely used to compute the predictions of QCD for high-energy experiments, by including the information carried by the polarization of the partons. For observables that do not depend on the spins of the final state particles, this introduces a correlation between the azimuthal angles that is not included in current calculations. It also allows one to compute parton showers for observables that do depend on the final state spins. (4 refs.)

111971 $q\bar{q}g$ hybrid mesons in the MIT bag model. T.Barnes, F.E.Close (Rutherford Appleton Lab., Chilton, Didcot, England), F.de Viron. *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.241-64 (12 Sept. 1983).
The authors suggest that hybrid ($q\bar{q}g$) mesons could exist with rather light masses. The spectrum of the ground state nonets, $J^{PC} = (0,1,2)^{--}; 1^{--}$ is

calculated in the MIT bag model including $O(\alpha_s)$ energy shifts. They discuss hadronic transitions among these states, consider their possible production at LEAR and SPEAR and indicate some interesting decay signatures. (42 refs.)

111972 Comment on 'Quark indistinguishability and the structure functions of the nucleon in a field-theoretic quark model'. M.Gupta (Dept. of Phys., Panjab Univ., Chandigarh, India). *Phys. Rev. D (USA)*, vol.28, no.5, p.1225-6 (1 Sept. 1983).
As a test of the valence contribution of quarks to structure functions, $\Delta^{pp} (=F_2^{pp} - F_2^{pn})$ is calculated in a quark-parton model proposed recently by Misra (1978). Agreement with data is fairly good. (11 refs.)

111973 Calculations of q^2q^2 states in potential theory. R.Aaron, M.H.Friedman, C.P.Jargocki (Dept. of Phys., Northeastern Univ., Boston, MA, USA). *Phys. Rev. D (USA)*, vol.28, no.7, p.1783-6 (1 Oct. 1983).
A model proposed by Aaron and Friedman (1982) is used to study q^2q^2 states. The results lead to speculations concerning the nature of the $\epsilon(1300)$. (9 refs.)

111974 Infrared singularities of the gluon propagator and quark confinement in the limit of an infinite number of colors. A.A.Slavnov (V.A.Steklov Math. Inst., Acad. of Sci., USSR). *Theor. & Math. Phys. (USA)*, vol.54, no.1, p.31-4 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.52-6 (Jan. 1983). [received: Sept. 1983]

An exact solution is obtained for the quark propagator in chromodynamics with neglect of the gluon-gluon interaction in the limit $N \rightarrow \infty$ for different asymptotic behaviours of the gluon propagator as $k \rightarrow 0$. It is shown that a singularity of the type $1/k^{2n}$, $n \leq 2$, leads to quark confinement. (8 refs.)

111975 WKB solutions to relativistic quarkonium model with the potential $V(r) = \mu^2 r + \beta \ln r/r_0$. P.Cea, G.Nardulli, G.Paiano (Dipartimento di Fisica, Univ. di Bari, Bari, Italy). *Z. Phys. C (Germany)*, vol.19, no.4, p.321-6 (1983).
The authors apply WKB techniques to a Schrodinger equation modified for relativistic kinematics. They show that a potential consisting of linear and logarithmic terms accounts for different aspects of quarkonium phenomenology. Using an extended vector meson dominance model they calculate $R_{e^+e^-}$ and derive the quark parton model result. (16 refs.)

12.35K Other composite models

(inc. composite quarks and leptons)

111976 Phenomenologically compatible solutions to 't Hooft's equations for composite models. Y.Meurice (Inst. de Phys. Theorique, Univ. Catholique de Louvain, Louvain-la-Neuve, Belgium). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.393-6 (8 Sept. 1983).
A general method is given for building subconstituent models with a spectrum which satisfies 't Hooft's equations and wherein at least three generations of quarks and leptons can be identified. Some applications are given. (12 refs.)

111977 Some experimental constraints on the possible substructure model of leptons and quarks. Huang Tao, Xie Yicheng (Inst. of High Energy Phys., Acad. Sinica, Beijing, China). *Sci. Sin. (China)*, vol.26, no.8, p.848-60 (Aug. 1983).
The authors have obtained general formulations of electromagnetic form factor and effective weak charged currents for leptons (or quarks) in a substructure model, in which, leptons (or quarks) and weak bosons are composed of massive preons (fermions and scalar bosons). It has been shown that, internal structure of leptons (or quarks) will probably contribute anomalous magnetic moment and $(V+A)$ weak charged current to leptons (or quarks), these contributions will become zero, if $H = -1$ and the truncated wavefunction of leptons (or quarks) has a spinor structure $(1-p/m_f)\gamma$. One can make the predicted anomalous magnetic moments and anomalous weak charged currents for leptons (or quarks) smaller than the limitation of experimental data by choosing suitable parameters even if the second condition is not satisfied. (10 refs.)

12.40 MODELS OF STRONG INTERACTIONS

Connection between Koba-Nielsen-Olesen distributions in totally inclusive and single-proton semi-inclusive reactions See Entry 112025

12.40E Statistical models

111978 Hadron production from quark fireballs and CERN SPS Collider results. T.R.Mongan. *Phys. Rev. D (USA)*, vol.28, no.5, p.1210-12 (1 Sept. 1983).
The hadron-production model developed in Phys. Rev. D, 23, 2554 (1981) gives a charged-hadron multiplicity in reasonable agreement with the CERN SPS Collider results at $E_{cm} = 540 \text{ GeV}$, if the production of particles heavier than pions during fireball decay is considered. (9 refs.)

The correlation between $\langle p_{\perp} \rangle$ and the central multiplicity in the hydrodynamical modelSee Entry 112023

12.40M Complex angular momentum plane; Regge poles and cuts (Reggeons)

(see also 11.60 for general theory)

111979 Phase-integral formulae in the complex angular momentum (CAM) pole analysis. K.-E.Thylwe (Inst. of Theoretical Phys., Univ. of Uppsala, Uppsala, Sweden). *J. Phys. A (GB)*, vol.16, no.14, p.3325-40 (1 Oct. 1983). Formulae for calculating CAM pole positions and corresponding S -matrix residues are derived within the framework of the phase-integral method of Froman and Froman (1965, 1974). The formulae allow for the use of higher-order approximations with rigorous error estimates. The contributions from two and three isolated tuning points are considered, which allows applications in the study of rainbow and diffraction features as well as orbiting phenomena in elastic scattering processes. (21 refs.)

111980 On the completeness of the family of eigenfunctions of double-sided Regge problem. I.Yu.Popov, A.V.Strepetov. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.3, p.25-31 (July 1983). In Russian. Let k_n , $Im\ k_n > 0$, be the zeros of analytic continuation of S -matrix $S(k)$ associated with the operator $Lu = -u'' + q(x)u$, where $q(x) = 0$ for $|x| > a$. Let $f_1(x, k_n)$ be the solutions of the equation $-f_1''(x, k_n) + q(x)f_1(x, k_n) = k_n^2 f_1(x, k_n)$ obeying the conditions: $f_1'(b, k_n) + ik_n f_1(b, k_n) = 0$, $f_1(-b, k_n) - ik_n f_1(-b, k_n) = 0$, $b \geq a$. The completeness of the family $\{f_1(x, k_n)\}$ in $L_2(-b, b)$, when $b \leq 2a$, is proved. (6 refs.)

12.40Q Potential models

111981 A folded diagram method for deriving an energy-independent nucleon-nucleon (N-N) potential from meson exchanges. II. Application. Li Guang-lie (Inst. of High Energy Phys., Acad. Sinica, Peking, China), K.K.Ng, T.T.S.Kuo. *Phys. Energ. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.342-5 (May 1983). In Chinese. For pt.I see ibid., vol.7, p.67 (1983). Using the method proposed in pt.I, the authors investigate the potential between two neutral scalar nucleons by exchanging neutral scalar mesons. The results show that the contribution of mesonic folded diagrams to this potential is not negligible. (2 refs.)

On the influence of hadronic decay on the properties of hadronsSee Entry 111967

Baryons with charm and strangeness in potential modelsSee Entry 111986

12.40S Multiperipheral and multi-Regge models

(inc. diffraction and diffractive production models)

111982 Construction of diffractive amplitudes. M.Giffon (Inst. de Phys. Nucleaire, Univ. Claude Bernard Lyon-1, Villeurbanne, France), Y.Hama, E.Predazzi. *Z. Phys. C (Germany)*, vol.19, no.4, p.311-20 (1983). Starting from a simple parametrization of production amplitudes an explicit construction of the diffractive elastic amplitude through multiparticle unitarity is given. It is shown that the phase cancellation effect is essential in order to obtain an elastic amplitude which displays a diffractive peak in qualitative agreement with the data. (15 refs.)

Diffractive proton fragmentation in 16, 32, and 110 GeV/c K^-p interactions and the diffractive production of heavy quarks ($s\bar{s}, c\bar{c}$)See Entry 112028

12.40V Vector-meson dominance

111983 Virtual-photon shadowing in nuclei and photon structure. J.A.Alonso, J.L.Sanchez-Gomez (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.121-4 (15 Sept. 1983). The 'standard' two-component (point-like plus VMD) model for the structure of photons seems to be in conflict with recent measurements of total hadronic cross sections for virtual photons incident on several nuclei. The authors show that the model works provided that certain off-shell effects, suggested within the framework of QCD, are properly taken into account. (8 refs.)

WKB solutions to relativistic quarkonium model with the potential $V(r) = \mu^2 r + \beta \ln r / r_0$ See Entry 111975

12.70 HADRON MASS FORMULAS

111984 Modified Gell-Mann-Okubo mass formula in the (8,8) model. T.N.Tiwari, C.V.Sastry (Dept. of Phys., Regional Engng. Coll., Rourkela, India), S.Sharma. *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.425-6 (July 1983). A modified version of the famous Gell-Mann-Okubo mass formula for the pseudoscalar mesons has been derived from the (8,8) model of the broken chiral SU(3) \otimes SU(3) symmetry. This modified formula agrees with the experimental data to within 0.4%, which is much better compared to 6.3% for the original formula. (10 refs.)

111985 Heavy baryons as bound states of three quarks. A.B.D'Oliveira (Instituto de Fisica, Univ. Fed. Fluminense Outeiro de S.J. Batista, Rio de Janeiro, Brazil), H.F.De Carvalho, E.C.Gerck. *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.1, p.27-32 (3 Sept. 1983). The authors calculate the mass spectrum of heavy baryons as nonrelativistic bound states of three quarks, using phenomenological potentials for the quark-quark interactions derived from QQ effective potentials obtained from fits of the J/ψ and Υ families. They solve Schrodinger's equation according to Flugge (1961) and Zickendraht's (1965) prescription, using a method deve-

loped especially for confining potentials. Results are compared for several types of confining potentials. (9 refs.)

111986 Baryons with charm and strangeness in potential models. J.M.Richard (Div. Phys. Theorique, Inst. de Phys. Nucleaire, Orsay, France), P.Taxil. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.453-6 (8 Sept. 1983). The authors use various interquark potentials to calculate the masses of heavy baryons (QSC) and (SSC) with charm and strangeness. In particular the mass of the recently discovered A^+ baryon (USC) can be extrapolated from the masses of the already known baryons. (15 refs.)

111987 Dirac bound-state spectra of $Q\bar{Q}$, $q\bar{q}$, and Qq systems. S.N.Jena, T.Tripati (Dept. of Phys., Aska Sci. Coll., Aska, India). *Phys. Rev. D (USA)*, vol.28, no.7, p.1780-2 (1 Oct. 1983). The mass spectra of $Q\bar{Q}$, $q\bar{q}$, and Qq systems are studied in a unified manner in the Dirac equation with an equally mixed four-vector and scalar power-law potential of the form $V(r) = Ar^{0.1} + V_0$. It is found that with this potential, which describes the ψ , Υ , and ϕ systems reasonably well, the current-mass values for the light quarks give an excellent fit to the spectra of D, F, and B mesons. (9 refs.)

12.90 MISCELLANEOUS THEORETICAL IDEAS AND MODELS

111988 Difficulties with massless particles?. M.Flato (Phys. Math., Faculte des Sci. Mirande, Dijon, France), D.Sternheimer, C.Fronsdal. *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.563-73 (1983). Some difficulties with sharp momentum (one-particle) states for massless particles are indicated, in the framework of unitary irreducible representations of the Poincare group. It is shown that a Poincare covariant set of such states requires the introduction, in the spatial direction opposite to the point stabilized, of momentum generalized eigenstates which (when the helicity is non-zero) have a nontrivial orbital transformation. The relevance of these generalized momentum eigenstates for massless theories is then shown. (15 refs.)

13.00 SPECIFIC REACTIONS AND PHENOMENOLOGY

13.10 WEAK AND ELECTROMAGNETIC INTERACTIONS OF LEPTONS

111989 Photoproduction of selectrons in linear e^+e^- colliders. M.Gluck (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.255-6 (22 Sept. 1983). It is suggested to observe photoproduced selectrons in linear e^+e^- colliders. The energetic photons are provided by an intense laser photon beam colliding with the electron beam. The observability of selectrons is then essentially limited by phase space, i.e. by $m_{\tilde{e}} + m_{\tilde{s}} \lesssim \sqrt{s}$. (7 refs.)

111990 Measurement of the processes $e^+e^- \rightarrow e^+e^-$ and $e^+e^- \rightarrow \gamma\gamma$ at PETRA. W.Bartel, L.Becker, C.Bowdery, D.Cords, R.Eichler, R.Felst, D.Haidt, H.Krehbiel, B.Naroska, J.Olsson, P.Steffen, P.Warming (DESY, Hamburg, Germany), G.Dietrich, E.Elsen, G.Heinzelmann, H.Kado, K.Meier, A.Petersen, U.Schneekloth, G.Weber, S.Bethke, A.Dieckmann, J.Heintze, K.H.Hellenbrand, R.D.Heuer, S.Komamiya, J.von Krogh, P.Lennert, H.Matsumura, H.Rieseberg, A.Wagner, A.Bell, A.Finch, F.Foster, G.Hughes, T.Nozaiki, H.Wriedt, J.Allison, A.H.Ball, G.Bamford, R.Barlow, I.P.Duerdoh, I.Glendingning, F.K.Loebinger, A.A.Macbeth, H.McCann, H.E.Mills, P.G.Murphy, P.Rowe, K.Stephens, D.Clarke, R.Marshall, G.F.Pearce, J.B.Whittaker, J.Kanzaki, T.Kawamoto, T.Kobayashi, M.Koshiha, M.Minowa, M.Nozaiki, S.Odaka, S.Orito, A.Sato, H.Takeda, T.Takeshita, Y.Totsuka, Y.Watanabe, S.Yamada, C.Yanagisawa. *Z. Phys. C (Germany)*, vol.19, no.3, p.197-203 (1983). Cross sections for the reactions $e^+e^- \rightarrow e^+e^-$ (Bhabha scattering) and $e^+e^- \rightarrow \gamma\gamma$ are measured for center-of-mass (c.m.) energies \sqrt{s} between 12.0 and 34.6 GeV. The results agree with the predictions of Quantum Electrodynamics (QED) and the cut-off parameters are determined. From Bhabha scattering at the highest energy, $\langle \sqrt{s} \rangle = 34.6$ GeV, the σ limits $0.12 < \sin^2 \theta_w < 0.38$ are obtained for the weak mixing angle. The higher order (α^3) QED processes $e^+e^- \rightarrow e^+e^- \gamma$ and $e^+e^- \rightarrow \gamma\gamma\gamma$ are also studied and are found to agree with the α^3 QED predictions. A search for excited electrons is carried out by investigating the $(e^+ \gamma)$ invariant mass distribution in the reaction $e^+e^- \rightarrow e^+e^- \gamma$. (12 refs.)

111991 Constraints on heavy quark-antiquark states. A.K.Common (Math. Inst., Univ. of Kent, Canterbury, England). *Nucl. Phys. B, Part. Phys. (Netherlands)*, vol.B224, no.2, p.229-40 (12 Sept. 1983).

The author improves on and extended previous constraints on the radii and kinetic energies of heavy quark-antiquark systems. Meaningful bounds are placed on corrections to the Van-Royen Weisskopf formula for the leptonic decay rates of these systems. Bounds on the position and width of the peak of the ground state wave functions are also derived. (10 refs.)

111992 Lifetime of particles containing b quarks. E.Fernandez, W.T.Ford, A.L.Read,Jr., J.G.Smith (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), R.De Sangro, A.Marini, I.Peruzzi, M.Piccolo, F.Ronga, H.T.Shalk, H.B.Wald, R.Weinstein, H.R.Band, M.W.Gettner, G.P.Goderre, B.Gottschalk, R.B.Hurst, O.A.Meyer, J.H.Moromisato, W.D.Shambroom, E.von Goeler, W.W.Ash, G.B.Chadwick, S.H.Clearwater, R.W.Coombes, H.S.Kaye, K.H.Lau, R.E.Leedy, H.L.Lynch, R.L.Messner, S.J.Michalowski, K.Rich, D.M.Ritson, L.J.Rosenberg, D.E.Wiser, R.W.Zdarko, D.E.Groom, Hoyun Lee, E.C.Loh, M.C.Delfino, B.K.Heltsley, J.R.Johnson, T.L.Lavine, T.Maruyama, R.Prepost. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1022-5 (19 Sept. 1983).

From a sample of hadronic events produced in e^+e^- collisions, semileptonic decays of heavy particles have been isolated and used to obtain a measurement of the bottom-quark lifetime of $[1.8 \pm 0.6 \text{ (stat.)} \pm 0.4 \text{ (syst.)}] \times 10^{-12}$ sec. (14 refs.)

111993 Leading order gluino pair production in heavy quarkonium decays. M.Gluck (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.257-9 (22 Sept. 1983).

Leading order gluino production rates in heavy quarkonium (QQ) decays are calculated and compared to the standard gluon production rates. The dependence of this ratio of production rates on the masses of the heavy quark (Q) and the gluino provides a tool for their determination. (5 refs.)

13.25 HADRONIC DECAYS OF MESONS

111994 A model for baryon enhancement in T decay. A.Snyder (Rutgers Univ., New Brunswick, NJ, USA), C.G.Trahern. *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.117-20 (15 Sept. 1983).

The authors present a model based on the three-gluon annihilation of quarkonia which accounts for the baryon enhancement observed in T decays. (7 refs.)

111995 Ratio of lifetimes for the D^+ and D^0 mesons. B.F.L.Ward (Internat. Centre for Theoretical Phys., Trieste, Italy). *Phys. Rev. D (USA)*, vol.28, no.5, p.1215-18 (1 Sept. 1983).

Using the SLAC lattice QCD theory, the author derives an effective interaction density for the process $c+\bar{u} \rightarrow s+G$, where G is a gluon. In this way, the author calculates the ratio of lifetimes for the D^+ and D^0 mesons. The result for this ratio is close to unity. (16 refs.)

On the influence of hadronic decay on the properties of hadronsSee Entry 111967

13.30 DECAYS OF BARYONS

111996 Proton decay: is it fast enough?. A.N.Mitra, R.Ramanathan (Dept. of Phys., Univ. of Delhi, Delhi, India). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.381-4 (8 Sept. 1983).

A comprehensive Bethe-Salpeter model for qq and qq \bar{q} systems under harmonic confinement, which has provided an impressive set of agreements in respect of (i) qq, qq \bar{q} mass spectra, (ii) electromagnetic properties of mesons and baryons the proton charge radius and (iii) strong couplings of hadrons, all with basic parameters (universal spring constant $\bar{W}=0.15$ GeV and quark mass $m_q=0.28$ GeV), is employed for the calculation of proton decay rates (inclusive and exclusive). Keeping the GUT parameters fixed at the 'standard' values listed, e.g. in Langacker's review, the decay rates for the inclusive and exclusive modes are: $\Gamma(p \rightarrow e^+ \pi^0)=0.540$, $\Gamma(p \rightarrow e^+ \pi^+)=0.1824$, in 10^{-33} yr $^{-1}$ units. These values (which are mutually consistent) are smaller by about a factor 100 than several contemporary calculations, but do yet seem to be ruled out by the available data. (26 refs.)

111997 Possibility of CP violation in the cascade non-leptonic decays. K.Gavroglou (Phys. Lab., Nat. Tech. Univ., Athens, Greece). *Z. Phys. C (Germany)*, vol.19, no.4, p.361-3 (1983).

There is more than one parameter expressing CP violation in the non-leptonic hyperon decays. The recent experimental results provide us with indications that CP conservation may not be valid for the Ξ decays. Especially for the Ξ decays this is not due to the deviations from the exact $\Delta I=1/2$ rule. (7 refs.)

111998 Measurements of hyperon semileptonic decays at the CERN super proton synchrotron IV tests of the Cabibbo model. Report RL-83-054, Rutherford Appleton Lab., Chilton, Oxon., England (June 1983), 32 pp.

Pt.III ref. unobtainable. Results on five different hyperon semileptonic decays from the WA2 experiment, performed in the CERN SPS charged hyperon beam, have been analysed within the framework of the Cabibbo model. For the first time, the inconsistencies, which inevitably occur when the results from different experiments are combined, have been avoided in these comprehensive fits to high statistics data from a single hyperon decay experiment. Excellent agreement with the basic Cabibbo model has been obtained using the WA2 data either alone or together with neutron lifetime measurements. These results contrast strongly with other recent Cabibbo analyses which have indicated the presence of SU(3) breaking effects. Including radiative corrections the authors have obtained the results, $F=0.477 \pm 0.012$, $D=0.756 \pm 0.011$ and $\sin \theta_C=0.231 \pm 0.003$. (27 refs.)

13.35 DECAYS OF LEPTONS

111999 Does the positron from muon decay have transverse polarization?. F.Corriveau (Lab. fur Hochenergiephys., Eidgenossische Tech. Hochschule Zurich, Villigen, Switzerland), J.Egger, W.Fetscher, H.-J.Gerber, K.F.Johnson, H.Kaspar, H.J.Mahler, M.Salzmann, F.Scheck. *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.260-4 (22 Sept. 1983).

The transverse polarization of the e^+ in μ^+ decay has been measured for the first time. This measurement allows the initial determination of the four μ decay parameters: α/A and β/A [with their linear combination $\eta=(\alpha-2\beta)/A$] plus, as the first direct measurement of time reversal noninvariant parameters in a purely leptonic interaction α'/A and β'/A . The results are consistent with zero and in agreement with the standard V-A form of the charged leptonic weak interaction. (14 refs.)

112000 Upper bound on the decay constant of familons. D.A.Dicus (Center for Particle Theory, Univ. of Texas, Austin, TX, USA), V.L.Teplitz. *Phys. Rev. D (USA)*, vol.28, no.7, p.1778-9 (1 Oct. 1983).

For massive neutrinos that can decay by emission of a familon (f), a flavor-changing axion, the upper bound on the cosmic energy density of the decay products yields (1) an upper bound on the familon decay constant, and consequently (2) a lower bound on other f emission rates. By comparing the K $\rightarrow \pi f$ lower bound with the experimental upper bound, the authors rule out neutrinos that decay by familon emission and have masses between 5×10^{-5} and 0.1 MeV. (6 refs.)

112001 Charmed baryon magnetic moments in broken SU(8) model. K.P.Tiwari, C.P.Singh (Dept. of Phys., VSSD Coll., Kanpur, India). *Indian J. Pure & Appl. Phys.*, vol.21, no.7, p.427-9 (July 1983).

The magnetic moments of charmed baryons are studied in the broken SU(8) framework, including the additional symmetry-breaking effects due to quark masses. The results so obtained differ from those of the conventional quark model incorporating quark-mass breaking in magnetic moment operator only. (27 refs.)

112002 An upper limit on neutrino electric dipole moments. J.A.Morgan, D.B.Farrant (Astron. Centre, Sussex Univ., Brighton, England). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.431-2 (8 Sept. 1983).

An upper limit of 2.5×10^{-22} e cm for a possible neutrino electric dipole moment is found from a cosmological argument. (10 refs.)

112003 Recoil corrections to the nucleon magnetic moment in the bag model. P.A.M.Guichon (CERN, Geneva, Switzerland). *Phys. Lett. B (Netherlands)*, vol.129B, no.1-2, p.108-12 (15 Sept. 1983).

It is shown that the recoil correction to the value of the nucleon magnetic moment computed in the static bag model is small and negative. This is due to an over-cancellation of the spin precession effect by the retardation effect. The latter has been ignored in previous calculations, leading to a large positive correction. (15 refs.)

112004 Bound state wavefunctions and anomalous magnetic moments of leptons. Chao Kuang-Tn (Dept. of Phys., Peking Univ., Peking, China). *Phys. Energ. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.323-32 (May 1983). In Chinese.

Assuming that leptons are composed of a heavy fermion and a heavy scalar boson and using the Bethe-Salpeter equation, the author concludes that in the non-relativistic limit the radius and, in particular, the anomalous magnetic moment of leptons can be sufficiently small provided that the interaction of the constituents is of a vector type and that the fermion is much heavier than the scalar boson. Whereas the scalar type interaction can only give wavefunctions with large radius and anomalous magnetic moment. (10 refs.)

112005 Further evidence for the radiative decay of a light, penetrating particle. H.Faissner, W.Heinrigs, A.Preussger, D.Samm (III. Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany). *Phys. Rev. D (USA)*, vol.28, no.5, p.1198-201 (1 Sept. 1983).

Photons and photon pairs from the 590-MeV proton beam dump at SIN have been observed in a counter-triggered spark chamber, placed behind 7.5 m of iron-concrete and 2 m of free space. Nineteen 1 γ events and twelve 2 γ events were found at angles $\alpha \leq 7^\circ$ from the beam-dump direction, whereas a background of, respectively, 4.8 and 2.3 events had been expected. The effect was unchanged by 20 cm of iron in front of the decay region, but vanished when the iron was moved to the end of this region, suggesting these surplus photons stem from a decay. (26 refs.)

112006 Direct comparison between the γ -ray fluxes from proton beam dumps at LAMPF and SIN. H.Faissner, E.Frenzel, W.Heinrigs, A.Preussger, D.Samm (Phys. Inst., RWTH Aachen, Aachen, Germany). *Phys. Rev. D (USA)*, vol.28, no.7, p.1787-9 (1 Oct. 1983). A direct comparison is made between the limit of γ -ray flux obtained at LAMPF, and the rate of 2γ (and 1γ) events found traveling along the beam-dump direction at SIN. The two experiments are not at variance with each other. The LAMPF result is shown to imply limits on axion properties. In turn a limit on muon-neutrino decay of $\tau_\nu/m_\nu > 0.07$ sec/eV is derived from the SIN 1γ data. (16 refs.)

112007 Reply to 'Direct comparison between the γ -ray fluxes from proton beams dumps at LAMPF and SIN'. J.S.Frank, R.L.Burman, D.R.F.Cochran (Los Alamos Nat. Lab., Los Alamos, NM, USA), P.Nemethy, S.E.Willis, V.W.Hughes, R.P.Redwine, J.Duclos, H.Kaspar, C.K.Hargrove, U.Moser. *Phys. Rev. D (USA)*, vol.28, no.7, p.1790-2 (1 Oct. 1983). From the analysis of their own data, the authors find an upper limit of $a \leq 0.35$ (95% confidence level) on the χ^0 -decay photon flux in the LAMPF neutrino experiment when normalized to the observed photon flux $a = 1.0 \pm 0.6$ (95% confidence level) of the SIN experiment. With the relativistic-phase-space model of χ^0 production the 95%-confidence-level limits of the two experiments do not overlap. (9 refs.)

13.60P Baryon and baryon resonance production

112009 Photoproduction of hermaphrodite baryons. T.Barnes, F.E.Close. **Report RL-83-020, Rutherford Appleton Lab., Chilton, Oxon., England (Feb. 1983), 13 pp.**

Shows that photoexcitation of the lightest hermaphrodite baryons is strongly suppressed from proton targets but allowed from neutrons, a result that is reminiscent of a quark model selection rule due to Moorhouse (1966). This is consistent with suggestions that the $P_{11}(1710)$ is the lightest $q\bar{q}G$ baryon and eliminates the possibility that the Roper resonance is dominantly an hermaphrodite state. Magnetic moments do not constrain the possibility of considerable mixing of $q\bar{q}G$ into the nucleon and delta's Fock space wavefunctions. (17 refs.)

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

112010 Electron-positron annihilation cross section in $SU(2)_L \otimes U(1)$ supergravity. D.A.Dicus, S.Nandi, W.W.Repko, X.Tata (Center for Particle Theory, Univ. of Texas, Austin, TX, USA). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1030-3 (19 Sept. 1983).

For a wide range of masses the W superpartners and the supersymmetric scalars it is shown that a measurement of the total electron-positron annihilation cross section is sufficient to demonstrate the existence or nonexistence of supersymmetry. (9 refs.)

112011 Limits on J/ψ and Υ production in e^+e^- interactions at $\sqrt{s}=29$ GeV. Lett. B (Netherlands)*, vol.129B, no.1-2, p.141-4 (15 Sept. 1983).

A search has been made for the inclusive production of J/ψ (3.1) and Υ (9.4) mesons e^+e^- interactions at 29 GeV via their decay into two leptons. No signal is observed in the J/ψ region, nor in the Υ region. The limits on the cross sections are $\sigma(e^+e^- \rightarrow \psi X) < 4.4 \times 10^{-36}$ cm², and $\sigma(e^+e^- \rightarrow \Upsilon X) < 4.7 \times 10^{-36}$ cm². The same data yields limits on the branching

ratios for the b quark BR ($b \rightarrow \psi X$) < 4.9% and BR ($b \rightarrow \Upsilon X$) < 0.8%. (11 refs.)

112012 Precise measurement of total cross sections for the process $e^+e^- \rightarrow$ multihadrons in the CM energy range between 12.0 and 36.4 GeV. W.Bartel, L.Becker, C.Bowdery, D.Cords, R.Fichler, R.Felst, D.Haidt, H.Krehbiel, B.Naroska, J.Olsson, P.Steffen, P.Warming (DESY, Hamburg, Germany), G.Dietrich, E.Elsen, G.Heinzelmann, H.Kado, K.Meier, A.Petersen, U.Schneekloth, G.Weber, S.Bethke, A.Dieckmann, J.Heintze, K.H.Helbrand, R.D.Heuer, S.Komamiya, J.von Krogh, P.Lennert, H.Matsumura, H.Rieseberg, A.Wagner, A.Bell, A.Finch, F.Foster, G.Hughes, T.Nozaki, H.Wriedt, J.Allison, A.H.Ball, G.Bamford, R.Barlow, I.P.Duerdort, I.Glenn-dinning, F.K.Loebinger, A.A.Macbeth, H.McCann, H.E.Mills, P.G.Murphy, P.Kawe, K.Stephens, D.Clarke, R.Marshall, G.F.Pearce, J.B.Whittaker, J.Kanzaki, T.Kawamoto, T.Kobayashi, M.Koshiha, M.Minowa, M.Nozaki, S.Odaka, S.Orito, A.Sato, H.Takeda, T.Takeshita, Y.Totsuka, Y.Watanabe, S.Yamada, C.Yanagisawa.

Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.145-52 (15 Sept. 1983).

The total cross section for the process $e^+e^- \rightarrow$ hadrons has been measured in the CM energy range between 12.0 and 36.4 GeV using the JADE detector with a typical systematic error of $\pm 3\%$. The ratio $R(\sigma(e^+e^- \rightarrow \text{hadrons})/\sigma_p)$ is found to be constant over this range with an average value of 3.97 ± 0.05 (statistical and point-to-point systematic error) ± 0.10 (normalization error). The data were compared with the standard electro-weak interaction model including QCD corrections. (16 refs.)

112013 Production of a single heavy quark in e^+e^- collisions. G.Eilam (Fermi Nat. Accelerator Lab., Batavia, IL, USA). *Phys. Rev. D (USA)*, vol.28, no.5, p.1202-5 (1 Sept. 1983).

Cross sections for the flavor-changing neutral transition $e^+e^- \rightarrow \bar{t}c$ are calculated in the standard model with three generations, and found to be unmeasurable; $e^+e^- \rightarrow b\bar{s}$ is a few orders of magnitude larger. Experimentalists should nevertheless look for these processes since an increase in the number of generations, strong-interaction effects, and mainly nonstandard models may lead to observable rates. Z^0 decays into a single heavy quark plus a light one are also briefly discussed. (16 refs.)

112014 Hadronic-energy correlations in high-energy e^-e^+ annihilation. F.Csikor, G.Pocsik, A.Toth (Inst. for Theoretical Phys., Eotvos Univ., Budapest, Hungary). *Phys. Rev. D (USA)*, vol.28, no.5, p.1206-9 (1 Sept. 1983).

Extending Brown and Li's calculations (1982), energy-energy correlations in $e^+e^- \rightarrow \gamma, Z^0 \rightarrow \Sigma$ hadrons are investigated off and on the Z^0 peak. The authors establish that while this process measures exactly the same hadronic structure functions as $e^+e^- \rightarrow \gamma \rightarrow \Sigma$ hadrons, the two processes result in different dependences on external angles in the energy-energy correlation at arbitrary initial-state polarizations. The angle-integrated and normalized energy-energy correlations are also studied and found to be independent of initial-state polarization and the details of the γ and Z^0 exchanges (coupling constants and Z^0 mass and width). (6 refs.)

112015 Energy moments for quark jets at PETRA. C.Berger, H.Genzel, W.Lackas, J.Pielorz, F.Raupach, W.Wagner (I. Phys. Inst., RWTH Aachen, Aachen, Germany), L.H.Flolo, A.Kloving, E.Lillestol, J.M.Olsen, J.Burger, L.Criegee, Ch.Dehne, A.Deuter, A.Eskreys, G.Franke, M.Gasparo, Ch.Gerke, U.Jacobs, G.Knies, B.Lewendel, U.Maurus, J.Meyer, U.Michelsen, K.H.Pape, B.Stalla, U.Timm, G.G.Winter, S.T.Xue, M.Zachara, P.Waloschek, W.Zimmermann, P.J.Bussey, S.L.Cartwright, J.B.Dainton, B.T.King, C.Raine, J.M.Scarr, I.O.Skillicorn, K.M.Smith, J.C.Thomson, O.Achterberg, L.Boesten, D.Burkart, K.Diehlmann, V.Hepp, H.Kapitzka, B.Koppitz, M.Kruger, W.Luh-rsen, M.Poppe, H.Spitzer, R.van Staa, C.Y.Chang, R.G.Glasser, R.G.Kellogg, S.J.Maxfield, R.O.Polvado, B.Sechi-Zorn, J.A.Skard, A.Skujia, A.J.Tylka, G.E.Welch, G.T.Zorn, F.Almeida, A.Backer, F.Barreiro, S.Brandt, K.Derik-um, C.Grupen, H.J.Meyer, H.Muller, B.Neumann, M.Rost, K.Stupperich, G.Zech, G.Alexander, G.Bella, Y.Gnat, S.Grunhau, J., H.J.Daum, H.Junge, K.Kraski, C.Maxeiner, H.Maxeiner, H.Meyer, D.Schmidt.

Z. Phys. C (Germany), vol.19, no.3, p.205-12 (1983). Measurements of energy moments for single quark jets at c.m. energies between 12 and 31.6 GeV are presented. The data, corrected for detector effects and initial state radiation, are compared to QCD predictions in the leading log approximation. Nonperturbative effects are found to be moderate, and they strongly decrease with increasing c.m. energy. Once partly corrected for the presence of these fragmentation effects, the data agree well with all features of the leading log prediction, and in particular with the variation of the strong coupling constant over a wide range of energies and momentum transfers. (17 refs.)

112016 Inclusive production of electrons and muons in multihadronic events at PETRA. H.J.Behrend, H.Fenner, M.-J.Schachter, V.Schroder, H.Sindt (DESY, Hamburg, Germany), G.D'Agostini, W.-D.Apel, J.Engler, G.Flugge, D.C.Fries, W.Fues, K.Gamerdinger, G.Hopp, H.Kuster, H.Muller, H.Randoll, G.Schmidt, H.Schneider, W.de Boer, G.Buschhorn, G.Grindhammer, P.Grosche-Wiesmann, B.Gunderson, C.Kiesling, R.Kotthaus, U.Kruse, H.Lierl, D.Luers, H.Oberlack, P.Schacht, P.Colas, A.Cordier, M.Davier, D.Fournier, J.F.Grivaz, J.Haissinski, V.Journe, F.Laplanche, U.Mallik, J.-J.Veillet, J.H.Field, R.George, M.Goldberg, B.Grossetete, O.Hamon, F.Kapusta, F.Kovacs, G.London, L.Poggioli, M.Rivoal, R.Aleksan, J.Bouchez, G.Carnesecci, G.Cozzika, Y.Ducros, A.Gaidot, Y.Lavagne, J.Pamela, J.P.Pansart, F.Pierre.

Z. Phys. C (Germany), vol.19, no.4, p.291-9 (1983). The production of prompt leptons at PETRA has been measured for c.m. energies of 14, 22 and 34 GeV. The rate of prompt electrons and muons is presented, including a determination of the semileptonic branching ratio of the c and b quarks. The authors obtain

$B(c \rightarrow \mu \nu X) = 12.3 \pm 2.9$ (stat.) ± 3.9 (syst.)%,
 $B(b \rightarrow \mu \nu X) = 8.8 \pm 3.4$ (stat.) ± 3.5 (syst.)%,
 $B(b \rightarrow e \nu X) = 14.1 \pm 5.8$ (stat.) ± 3.0 (syst.)%. Systematic effects due to changes in fragmentation and other model parameters have been studied. (25 refs.)

112018 Consequence of isospin conservation in nucleon-nucleon scattering.

A.Gersten (Dept. of Phys., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel).

Phys. Rev. C (USA), vol.28, no.2, p.933-4 (Aug. 1983).

Isospin conservation in nucleon-nucleon scattering leads to an extension of the optical theorem to backward angles. The total neutron-proton and proton-proton cross sections are related to the imaginary parts of the neutron-proton amplitudes at backward angles. The author suggests to incorporate the above relations in the phase shift analysis, especially above 600 MeV lab energy where dibaryons are suspected to exist. (11 refs.)

112019 Elastic scattering at CERN collider energy and the geometrical picture. T.T.Chou (Dept. of Phys., Univ. of Georgia, Athens, GA, USA), Chen Ning Yang.

Phys. Lett. B (Netherlands), vol.128B, no.6, p.457-60 (8 Sept. 1983).

Recent UA1 and UA4 experimental results for $\bar{p}p$ collisions at 540 GeV center of mass energy are analyzed in the geometrical picture. (14 refs.)

13.85H Inelastic scattering, many-particle final states (energy > 10 GeV)

112020 Search for new $S\bar{S}$ states in the K^- induced K^+K^- system.

T.Armstrong (LPNHE, Univ. Paris VI, Paris, France), M.Baubillier, J.C.Brient, W.Beusch, I.J.Bloodworth, G.Boca, M.Bonesini, D.Bortoletto, A.Burns, J.N.Carney, G.Cecchet, G.Costa, C.Evangelista, B.Ghidini, J.B.Kinson, V.Lenti, L.Mandelli, F.Navach, A.Palano, L.Perini, Y.Pons, E.Quercigh, Z.Strachman, M.Tamborini, M.F.Worsell, G.Zito, R.Zitoun.

Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.2, p.193-217 (12 Sept. 1983). Results from the first PWA of the K^+K^- system produced by incident K^- are presented in the mass range from the threshold to 1.70 GeV. In the P and D waves only the ϕ and f' mesons are observed and their production mechanism studied. A broad S wave peaking at 1.4 GeV is observed but the lack of information about its phase makes the search for new 0^{++} mesons inconclusive. (26 refs.)

112021 Study of resonance production in the multiparticle exclusive K^-p channels at 32 GeV/c. M.Yu.Bogoljubsky, V.V.Brysgalov, A.I.Kotova, S.G.Kiseleva, M.S.Levitsky, A.M.Moisev, D.I.Patalakha (IHEP, Serpukhov, USSR), U.Gensch, J.MacNaughton.

Z. Phys. C (Germany), vol.19, no.3, p.189-96 (1983). The cross sections for ρ^0 , $K^{*0}(890)$, Δ^{++} , Δ^0 and ϕ^0 -production are measured for the 6, 8 and 10 particle exclusive channels in a K^-p experiment at 32 GeV/c. For the channel $K^-p \rightarrow K^-2\pi^+2\pi^-p$ this study is done separately for the diffractive and non-diffractive components, separated by a rapidity gap method. It was found that the proportion of K^* , ρ and π^\pm , coming from resonance decay is a decreasing function of the channel multiplicity. (6 refs.)

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

112022 Evidence for $Z^0 \rightarrow e^+e^-$ at the CERN $\bar{p}p$ collider. P.Bagnaia (CERN, Geneva, Switzerland), M.Banner, R.Battiston, P.Bloch, F.Bonaudi, K.Borer, M.Borghini, J.-C.Chollet, A.G.Clark, C.Conta, P.Darriulat, L.Di Lella, J.Dines-Hansen, P.-A.Dorsaz, L.Fayard, M.Fraternali, D.Froidevaux, G.Fumagalli, J.-M.Gaillard, O.Gildemeister, V.G.Goggi, H.Grote, B.Hahn, H.Hanni, J.R.Hansen, P.Hansen, T.Himel, V.Hungerbuhler, P.Jenni, O.Kofoed-Hansen, E.Lancon, M.Livan, S.Loucatos, B.Madsen, P.Mani, B.Mansoulie, G.C.Mantovani, L.Mapelli, B.Merkel, M.Mermikides, R.Mollerud, B.Nilsson, C.Onions, G.Parroux, F.Pastore, H.Plochow-Besch, M.Polverel, J.-P.Repalli, A.Rimoldi, A.Rothenberg, A.Roussarie, G.Sauvage, J.Schacher, J.L.Siegrist, H.M.Steiner, G.Stimpfl, F.Stocker, J.Teiger, V.Vercesi, A.R.Weidberg, H.Zaccane, J.A.Zakrzewski, W.Zeller.

Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.130-41 (15 Sept. 1983). From a search for electron pairs produced in $\bar{p}p$ collisions at $\sqrt{s}=550$ GeV the authors report the observation of eight events which they interpret as resulting from the process $\bar{p}+p \rightarrow Z^0 + \text{anything}$, followed by the decay $Z^0 \rightarrow e^+e^-$ or $Z^0 \rightarrow e^+\tau^- + \gamma$, where Z^0 is the neutral Intermediate Vector Boson postulated by the unified electroweak theory. They use four of these events to measure the Z^0 mass $M_Z = 91.9 \pm 1.3 \pm 1.4$ (systematic) GeV/ c^2 . (16 refs.)

112023 The correlation between $\langle p_\perp \rangle$ and the central multiplicity in the hydrodynamical model. Y.Hama, F.S.Navarra (Istituto de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).

Phys. Lett. B (Netherlands), vol.129B, no.3-4, p.251-4 (22 Sept. 1983).

It is shown that the recently observed growth of $\langle p_\perp \rangle$ when the central multiplicity increases may be interpreted as a natural consequence of the hydrodynamical expansion of highly dense hadronic matter which is formed during multiparticle production processes. (11 refs.)

112024 Bose-Einstein correlations in $\alpha\alpha$, pp and $\bar{p}p$ interactions. T.Akeson (CERN, Geneva, Switzerland), M.G.Albrow, S.Almehed, R.Batley, O.Benary, H.Boggild, O.Botner, H.Breuker, H.Brody, V.Burkert, A.A.Carter, J.R.Carter, P.Cecil, S.U.Chung, W.E.Cleland, D.Cockerill, S.Dagan, E.Dahl-Jensen, I.Dahl-Jensen, P.Dam, G.Damgaard, S.Eidelman, W.M.Evans, C.W.Fabjan, P.Frandsen, S.Frankel, W.Frati, M.Gibson, U.Goerlach, H.Gordon, K.H.Hansen, B.Heck, V.Hedberg, J.Hiddleston, H.J.Hilke, J.Hooper, G.Jarkskog, P.Jeffreys, A.Kalinovsky, G.Kesseler, T.Killian, R.Kroeger, K.Kulka, J.van der Lans, J.Lindsay, D.Lissauer, B.Lorstad, T.Ludlam, A.Markou, N.A.McCubbin, U.Mjornmark, R.Moller, W.Molzon, B.S.Nielsen, A.Nilsson, L.H.Olsen, Y.Oren, L.Rosselet, E.Rosso, A.Rudge, R.Schindler, M.Sullivan, G.Thorstenon, E.Vella, J.Williamson, W.J.Willis, M.Winik, W.Witzeling, C.Woody, W.A.Zajc.

Phys. Lett. B (Netherlands), vol.129B, no.3-4, p.269-72 (22 Sept. 1983).

Bose-Einstein correlations between pions produced in the central region of rapidity in $\alpha\alpha$, pp and $\bar{p}p$ interactions have been studied at the ISR. The parameters r and τc —often interpreted as the radius and depth of the π -emitting region—are found to be independent of incident particle type but to depend on the mean charged multiplicity. In high multiplicity events, the pions appear to originate from a larger space-time region. (17 refs.)

112025 Connection between Koba-Nielsen-Olesen distributions in totally inclusive and single-proton semi-inclusive reactions. C.S.Lam, P.S.Yeung (Phys. Dept., McGill Univ., Montreal, Quebec, Canada).

Phys. Rev. D (USA), vol.28, no.5, p.1213-14 (1 Sept. 1983).

The authors obtain Koba-Nielsen-Olesen multiplicity distributions for $p+p$ —anything from a model relating them to the multiplicity distributions and the proton spectrum in $p+p \rightarrow p + \text{anything}$. The agreement with data for $100 \leq P_{\text{lab}} \leq 1000$ GeV/c is good; comparison with a similar model of Goulianos, Slicker, and White (1982) and the validity of such models at $\sqrt{s}=540$ GeV are discussed. (11 refs.)

112026 The LEAR project and physics with low energy antiprotons at CERN. A summary. R.Klapisch (CERN, Geneva, Switzerland).

Phys. Scr. (Sweden), vol.T5, p.140-2 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglo, Denmark, 16-20 Aug. 1982).

The programme of LEAR, the new facility for low energy antiprotons at CERN, is described. Sixteen initial experiments will explore: states in the proton-antiproton system, annihilation, search for glueballs, structure of the proton and interaction antiproton with nuclei. (3 refs.)

112027 Hadronic collisions: A quarkonium factory. R.Baier (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany), R.Ruckl.

Z. Phys. C (Germany), vol.19, no.3, p.251-66 (1983).

Hadronic collisions are quite efficient in producing new quark flavours due to the large gluon content of ordinary hadrons. In particular, one may expect sizable yields of heavy quark-antiquark bound states with various spin and orbital quantum numbers. Using perturbative QCD in combination with the nonrelativistic quarkonium model the authors present a fairly complete and detailed picture of charmonium and bottomonium production. They compare their results on inclusive J/ψ and γ distributions with high energy pp data and make predictions on η_c and χ production. (32 refs.)

112028 Diffractive proton fragmentation in 16, 32, and 110 GeV/c K^-p interactions and the diffractive production of heavy quarks ($s\bar{s}, c\bar{c}$). R.Gottgens, J.M.Kohli, P.Sixel (III. Phys. Inst., Tech. Hochschule Aachen, Aachen, Germany), U.Gensch, H.Vogt, Y.Goldschmidt-Clermont, D.R.O.Morrison, R.T.Ross, S.Squarcia, J.Chwastowski, M.W.Krasny, L.Suszycki, W.Zielinski, P.Girtler, D.Kuhn, K.W.J.Barnham, P.R.S.Wright, M.Zomorrodian, D.I.Patalakha, A.M.Moisev, J.MacNaughton, F.Mandi, M.Markytan, J.Mitendorf, M.Bardadin-Otinowska, A.Jacholkowska, M.Szczekowski.

Z. Phys. C (Germany), vol.19, no.4, p.283-90 (1983).

The inclusive proton diffraction dissociation cross sections in 16, 32, and 110 GeV/c K^-p interactions are determined from the spike near $x=1$ in the inclusive negative particle spectra and are compared to those obtained in K^-p interactions using other selection methods at various energies. The same procedure is applied to events containing a V^0 in order to obtain the cross section for diffractive $s\bar{s}$ production. While the total cross section for proton diffraction is found to be approximately constant in the energy range studied here, proton diffraction yielding an $s\bar{s}$ -pair is found to increase significantly. In particular it is almost constant at 85 μb for Λ^0 and Σ production but for NKK it rises from zero at 16 GeV/c to about 200 μb at 110 GeV/c. From the result for $s\bar{s}$ diffractive production an estimate for the $c\bar{c}$ diffractive production cross section of approximately 1-10 μb at 110 GeV/c is obtained.

13.88 POLARISATION IN INTERACTIONS AND SCATTERING

112029 Hadron polarization in e^+e^- annihilation. H.S.Mani, R.Ramachandran (Dept. of Phys., Indian Inst. of Technol., Kanpur, India).

Phys. Rev. D (USA), vol.28, no.7, p.1775-7 (1 Oct. 1983).

The authors show that while the polarization of the charmed quark produced in e^+e^- annihilation is of the order of 3% at $\sqrt{s}=5$ GeV, it gets washed out in subsequent decays. This should therefore cause the polarization of Λ^0 produced in $e^+e^- \rightarrow \Lambda^0 X$ to show a sharp fall as the energy crosses the charm threshold. They discuss ways of measuring charmed-quark polarization in the decays of charmed hadrons. (5 refs.)

20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

112032 Energy dependence of the rotational enhancement factor in the level density. G.Hansen, A.S.Jensen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Nucl. Phys. A (Netherlands), vol.A406, no.2, p.236-56 (19 Sept. 1983). The one-shell SU(3) energies are given and the corresponding level density is calculated approximately by use of a distribution function for the SU(3) quantum numbers. The calculation is extended to include many shells by a renormalization procedure and an effective one-shell interaction. The traditional level density is then obtained from the related mean-field hamiltonian which corresponds to a deformed harmonic oscillator potential. Various rotational enhancement factors are considered. Numerical results are obtained and comparisons between the SU(3) and the traditional level densities allow the first computation of the energy dependence of the rotational enhancement factor. A transition from axial to spherical level density is found. A simple parametrization is suggested in terms of a deformation-dependent half-value energy and a transition width. (26 refs.)

112033 Large transient magnetic fields for rare-earth ions recoiling in gadolinium and g-factors of high-spin states in $^{156,158,160}\text{Gd}$. O.Hauser, H.R.Andrews, D.Ward (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada), N.Rud, P.Taras, R.Nicole, J.Keinonen, P.Skensved, C.V.Stager.

Nucl. Phys. A (Netherlands), vol.A406, no.2, p.339-68 (19 Sept. 1983). The authors have determined the transient magnetic field for Coulomb-excited rare-earth nuclei recoiling with velocities in the range between $0.7v_0$ and $6v_0$ into ferromagnetic gadolinium cooled to a temperature $T=80\text{K}$. Measured and calculated g-factors in ^{169}Tm have been used as calibration standards. The transient field is found at first to increase with increasing recoil velocity, and then to level off, approaching a nearly constant value of $5.5\text{ kT at }v=6v_0$. At the higher velocities ($3v_0 < v < 6v_0$) the transient fields for ^{169}Tm recoils in gadolinium are a factor of 1.42 ± 0.12 larger than those in iron, whereas the densities of polarized electrons are the same in both ferromagnets. The transient field calibration has been corroborated making use of known g-factors of low-spin states in $^{156,158,160}\text{Gd}$ populated by Coulomb excitation of thick Gd single crystals. For the high-spin states in these nuclei, the g-factors are found to decrease slightly, with the ratio $g(10^+)/g(2^+)$ reduced to 0.89 ± 0.12 , 0.83 ± 0.11 , and 0.93 ± 0.13 , respectively. Similar decreases have been observed previously for other $N=90-96$ nuclei. (53 refs.)

112034 Odd Ni isotopes in the Lipkin-Nogami approach. R.Raj, M.L.Rustgi (Phys. Dept., Kurukshetra Univ., Kurukshetra, India).

Phys. Rev. C (USA), vol.28, no.2, p.935-7 (Aug. 1983). The modified Tamm-Dancoff approximation is applied to odd Ni isotopes after incorporating the Lipkin-Nogami procedure to improve the nonconservation of number of particles. The numerical calculations are performed employing the Kuo-Brown effective interaction. The Lipkin-Nogami procedure is found to give a general improvement in the agreement with data. (15 refs.)

112035 High-spin states in $^{201,203}\text{At}$ and the systematic behavior of $Z=85$ isotopes. K.Dybdal, T.Chapuran, D.B.Fossan, W.F.Piel, Jr. (Dept. of Phys., State Univ. of New York, Stony Brook, NY, USA), D.Horn, E.K.Warburton.

Phys. Rev. C (USA), vol.28, no.3, p.1171-80 (Sept. 1983). A spectroscopic investigation of high-spin states in $^{201,203}\text{At}$ was performed by means of the reactions $^{192,194}\text{Pt}(^{14}\text{N},\text{Sn})^{201,203}\text{At}$ with ^{14}N energies between 85 and 100 MeV. In-beam measurements of γ -ray excitation functions, γ - γ coincidences, γ -ray angular distributions, and pulsed-beam- γ timing were made to determine the decay scheme, level energies, γ -ray multipolarities, spin-parity assignments, and isomeric lifetimes. The yrast and near-yrast level structures were established up to $J \sim 25/2$, and several isomers with mean lifetimes around 20 ns were observed. The systematic trends of level energies of the odd-mass astatine ($Z=85$) isotopes are discussed in terms of proton-particle configurations of $^{211}\text{At}_{126}$ coupled to neutron-hole configurations of the corresponding even-mass lead isotopes. (15 refs.)

112036 Rotation-aligned bands in ^{196}Hg . H.Helppi, S.K.Saha, P.J.Daly (Dept. of Chem., Purdue Univ., West Lafayette, IN, USA), S.R.Faber, T.L.Kho.

Phys. Rev. C (USA), vol.28, no.3, p.1382-4 (Sept. 1983). Levels in ^{196}Hg have been studied by the $^{196}\text{Pt}(\alpha, n)$ reaction and the high-spin level scheme of ^{196}Hg has been considerably extended. Backbending in both positive and negative parity yrast level sequences is discussed within the cranked shell model description. (13 refs.)

112037 Properties of nuclei at high spins. F.S.Stephens (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Phys. Scr. (Sweden), vol.T5, p.5-9 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Nuclei generate high spins by two methods, alignment of single particle angular momentum and collective rotation. The competition of these two modes is discussed for the highest spins $40 \leq I \leq 65\hbar$. Evidence is presented that alignment of the $h_{9/2}$ and $i_{13/2}$ proton orbitals from the next higher major shell produces large effects at high spins in rotational nuclei in the $A=160-166$ region. It is suggested that such major shell effects produce the still larger irregularities known to occur in the lighter nuclei of this region. (10 refs.)

112038 Single-particle and collective aspects of rotating nuclei. I.Hamamoto (Niels Bohr Inst., Copenhagen, Denmark).

Phys. Scr. (Sweden), vol.T5, p.10-15 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Some features and quantum-numbers of one-particle motion in rotating potentials are summarized for 'high- J ' orbits and 'normal-parity' orbits, respectively. As an example of collective aspects of rotating nuclei, the disappearance of pair-correlation at high-spin states is discussed especially in connection with available experimental information. (24 refs.)

112039 Recent developments in the interpretation of the discrete line spectroscopy of deformed rare-earth nuclei. J.D.Garrett (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).

Phys. Scr. (Sweden), vol.T5, p.21-8 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Recent developments in the interpretation of high-spin discrete-line data in terms of independent-particle motion in a rotating deformed nucleus are discussed. Particular attention is given to the interpretation of the residual interactions derived from a comparison of routhians corresponding to multiple-quasineutron configurations and those constructed from 'experimental' values of the constituent single-quasineutron configurations. Similarly, the correlation between band-crossing frequencies in odd- N nuclei corresponding to the alignment of an $i_{13/2}$ pair of neutrons, and the shape of the valence quasineutron orbit is established for a variety of configurations. The correspondence between the residual-interactions and band-crossing frequencies is discussed, and the extracted estimate of the pairing reduction associated with the 'blocking' of a single quasi-neutron is compared with BCS estimates for constant level spacing. Finally, some suggestions are made concerning the physical basis of the shift in the $h_{9/2}$ proton alignment frequencies between $v_n=2$, $\pi=+$ and $v_n=4$, $\pi=-$ bands in ^{180}Os . (34 refs.)

112040 Aligned bands and nuclear shapes in the $N=90$ region. L.L.Riedinger (Phys. Dept., Univ. of Tennessee, Knoxville, USA).

Phys. Scr. (Sweden), vol.T5, p.36-44 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The $N=90$ transition region is studied by gauge-space systematics for Nd through Yb nuclei and by the trend of transition quadrupole moments for ground-state bands. Lifetime measurements on quasiparticle bands in $^{160,161}\text{Yb}$ indicate a systematic decrease in the collectivity at higher rotational frequencies, indicating triaxial shapes. Spectroscopy measurements on ^{159}Tm are described. A change in the order of the signatures of the $h_{11/2}$ and after, compared to before, the backbend is used to extract qualitative information on shape triaxiality. The systematics of 2 and 3 quasiparticle bands in $N=90$ and 91 nuclei is presented and used to deduce the occurrence of a large-interaction crossing in ^{160}Yb and ^{162}Hf due to the alignment of negative-parity neutrons ($h_{9/2}+f_{7/2}$). (35 refs.)

112041 'Non-rotating' yrast states. K.Neergard.

Phys. Scr. (Sweden), vol.T5, p.51-4 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Calculations for nuclei in the vicinity of ^{146}Gd based on a version of the deformed independent particle model are discussed. Particular attention is paid to systematic trends in the calculated deformations, deformation energies and pairing energies. (16 refs.)

112042 Collective vibrations as doorway states in the damping of nuclear motion. R.A.Brogli (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark).

Phys. Scr. (Sweden), vol.T5, p.80-3 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The damping of single-particle and giant resonances is studied. Doorway states containing low-lying surface vibrations are found to play a central role in this process. The coupling to these states lead to damping widths consistent with the empirical systematics. It is however not possible to directly relate these two quantities, because of the central role played by the correlation between the particle and the hole in the vibration. (4 refs.)

112043 Search for the two-phonon 0^+ strength in ^{64}Zn . A.Passoja, J.Kantele, M.Luontama, J.Kumpulainen, R.Julin (Dept. of Phys., Univ. of Jyväskylä, Jyväskylä, Finland).

Phys. Scr. (Sweden), vol.T5, p.145-6 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The two-phonon 0^+ strength in ^{64}Zn has been searched for by obtaining experimental results for the E0 and E2 transitions depopulating the excited 0_2^+ and 0_3^+ states. The previous identification of the 0_2^+ state in ^{64}Zn at 1910.3 keV as a two-phonon state is completely washed out through the present experimental results: $B(E2; 0_2^+ \rightarrow 2_1^+) = 0.058(3) \text{ W.u.}$, $B(E2; 0_2^+ \rightarrow 2_2^+) = 62(8) \text{ W.u.}$ and $\rho(E0; 0_2^+ \rightarrow 0_1^+) = 3.9(4) \times 10^{-3}$. (9 refs.)

112044 Multi-step shell-model description of Sn isotopes. L.Rydström, J.Blomqvist, R.J.Liotta (Res. Inst. of Phys., Stockholm, Sweden), C.Pomar.

Phys. Scr. (Sweden), vol.T5, p.149-52 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). A multi-step shell-model method is applied to calculate up to four neutron holes in the core ^{132}Sn . It is found that most low-lying states in the three- and four-hole nuclei are members of multiplets arising from the coupling of one- and two-hole states. (15 refs.)

112045 Microscopic calculations of nuclear wobbling rotation. P.Arve (NORDITA, Copenhagen, Denmark), Y.S.Chen, G.A.Leander.

Phys. Scr. (Sweden), vol.T5, p.157-61 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). High- K rotational bands may correspond to classical wobbling, which is a more complex motion than rotation around an intrinsic axis and therefore can in general not be described by the cranking model. Two microscopic models of wobbling are developed and found to give compatible results. One diagonalizes the response of a valence shell to a wobbling rotational core. The other is RPA with the field $F \sim [H_N, J_+]$, which turns out to be a major improvement over $F \sim r^2 Y_{21}$ employed in previous calculations. General features seem to be $\mathcal{I} < \mathcal{I}_{\text{rigid}}$ under many circumstances a fragmentation of the collective mode. The highest- K data available, from a recent experiment on ^{179}W , are reproduced without parameter fitting. Recent quasicontinuum data on ^{158}Yb are discussed. (28 refs.)

112046 Intrinsic excitations as yrast structures in ^{179}W above $I \sim 35/2\hbar$. Pedersen, S.Bjornholm, J.Borggreen, J.Kownacki, G.Sletten (Niels Bohr Inst., Roskilde, Denmark).

Phys. Scr. (Sweden), vol.T5, p.162-4 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

Gamma cascades through high-spin configurations with high seniority are found to feed the $t_{1/2} = 710$ ns isomer in ^{179}W . The abnormally short half life of the isomeric state itself, which decays into the $K=7/2$ ground-state rotational $31/2$ member, violating the K -selection rule twelve times, is explained as a result of an accidental degeneracy in energy between the $K^\pi = 35/2^-$ isomeric state and the $35/2^-$ ground-band rotational state. Above the isomer, the yrast structure is dominated by deformation aligned states. (8 refs.)

112047 Shape changes, band crossings and band terminations in the very high spin region of $A=150-160$ nuclei. T.Bengtsson, I.Ragnarsson (Dept. of Math. Phys., Lund Inst. of Technol., Lund, Sweden).

Phys. Scr. (Sweden), vol.T5, p.165-70 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

The very high spin behaviour of nuclei with ~ 10 particles outside the ^{146}Gd core are studied. The method of calculation, which is based on the cranked Nilsson-Strutinsky formalism, makes possible to follow individual configurations as functions of spin. The authors concentrate on ^{158}Er and ^{154}Dy which nuclei become oblate with rotation around the symmetry axes for $I=40-50$. It is found that most such oblate states can be described as band termination, i.e. they correspond to the maximum spin which can be formed if the distribution of nucleons over the f -shells is kept fixed. A strong argument which supports this conclusion is the M1-bump which has recently been observed for ^{158}Yb . Such an M1-bump seems to be a natural consequence of the terminating bands. A further consequence is that these bands appear to prohibit the formation of yrast isomers for spins much larger than $I=40$. (19 refs.)

112048 Kinematical and dynamical moments of inertia and the Mottelson-Valatin effect at high spin excitations. J.Dudek (SERC, Daresbury Lab., Daresbury, Warrington, England), W.Nazarewicz, Z.Szymanski.

Phys. Scr. (Sweden), vol.T5, p.171-4 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

Theoretical arguments, based on the pairing-selfconsistent independent quasi-particle model, are presented to support the idea of a collective transition from the superfluid to the normal phase (Mottelson-Valatin effect) in selected actinide nuclei. Detailed calculation results are in good agreement with existing experimental data. The strong relationship between the nucleonic angular momentum alignment and the disappearance of pairing correlations in nuclei is also discussed. It is suggested that a Mottelson-Valatin type mechanism dominates in the excitation pattern of $^{232-238}\text{U}$, while in the neighbouring thorium and plutonium nuclei the influence of nucleonic alignment and of a band crossing on the high spin properties seems more pronounced. (16 refs.)

112049 High spin phenomena in the mass 100-200 region seen through the Crystall Ball. J.J.Gaardhoje, J.D.Garrett, G.B.Hagemann, B.Herskind, A.Holm, P.Nolan, G.Sletten (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), J.R.Beene, M.L.Halbert, D.C.Hensley, I.Y.Lee, F.Plasil, F.A.Dilmanian, M.Jaaskelainen, H.Puchta, D.G.Sarantites, R.Woodward, T.Lindblad.

Phys. Scr. (Sweden), vol.T5, p.178-82 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

The average properties of the gamma ray entry region and the decay from it are studied systematically, for 49 nuclear systems, in the spin spectrometer. Preliminary results are given for the mass the neutron number of dependence of the gamma ray fold distribution and of unresolved γ spectra. The possibility of gating simultaneously on narrow regions of fold and excitation energy is exploited. (8 refs.)

112050 Coupling of two quasiparticles to coherent cores in the Pt isotopes. A.A.Raduta, C.Lima (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany), A.Faessler.

Z. Phys. A (Germany), vol.313, no.1-2, p.69-82 (1983).

A model for coupling the motion of particles to that of a quadrupole-collective core is proposed. The quadrupole vibrations and rotations of the core are described by angular momentum projected coherent states. The spherical shell model particles interact among themselves by pairing and surface delta interactions. The particles are coupled to the core through a multipole-multipole interaction. The method is applied to several even mass isotopes of Pt. The agreement with experimental data of the excitation energies, gyromagnetic factors and $E2$ probabilities is very good. (30 refs.)

112051 (p,p') scattering at 65 MeV on ^{12}C , ^{24}Mg , ^{28}Si and ^{32}S . S.Kato, K.Okada (Lab. of Nuclear Studies, Faculty of Sci., Osaka Univ., Toyonaka, Osaka, Japan), M.Kondo, K.Hosono, T.Saito, N.Matsuoka, K.Hatanaka, T.Noro, S.Nagamachi, H.Shimizu, K.Ogino, Y.Kadota, S.Matsuki, M.Wakai. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.241-5

Angular distributions of the cross sections and analyzing powers for the elastic and inelastic scatterings of 65 MeV polarised protons from ^{12}C , ^{24}Mg , ^{28}S and ^{32}S were measured. Coupled channels analyses of the scattering data to 0^+ , 2^+ , 4^+ states in the ground rotational bands, the 0^+ state in the β -band, 2^+ , 3^+ , 4^+ members in the γ -band, 3^- , 4^- members in the $K^\pi = 3^-$ octupole band and 1^- , 3^- members of the $K^\pi = 0^-$ octupole band were performed. A good agreement between data and the coupled channels calculation were obtained in analysing power for β -vibrational states and 3^- states. (9 refs.)

112052 Microscopic study of the resonant states with light-heavy di-nucleus configurations. A.Tohsaki-Suzuki (Faculty of Textile Sci. & Technol., Shinshu Univ., Nagano, Japan), K.Ikeda.

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.845-9

The energy quantities characterizing the molecular bands are considered on the basis of microscopic studies of $^{16}\text{O}+^{16}\text{O}$, $^{16}\text{O}+^{40}\text{Ca}$ and $^{40}\text{Ca}+^{40}\text{Ca}$ systems. The conditions are discussed on the formation of the resonant states with di-nucleus configurations. An obtained simple expression is applied to the other typical di-nucleus systems. (5 refs.)

112053 Energy of a nucleon in a nucleus. C.Mahaux (Inst. de Phys., Univ. de Liege au Sart Tilman, Liege, Belgium).

Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronter, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.151-76

In the independent particle model (IPM), the nuclear ground state wave function ϕ_A is a Slater determinant built with A single-particle wave functions $\phi_{\alpha}(r)$, where α generically denotes the orbit quantum numbers n,l,j,m . For simplicity, the author restricts the discussion to spherical nuclei. A consequence of the IPM is that the configurations $\phi_{A-1} = a_{\alpha}|\phi_A\rangle$, $\phi_{A+1} = a_{\alpha}^{\dagger}|\phi_A\rangle$ are eigenstates of the Hamiltonian H for $A-1$ and $A+1$ nucleons, respectively. Equations imply a symmetry property of H . The main purpose of these lectures is to discuss to what extent this symmetry holds in

nature. The amount of symmetry breaking depends upon the choice of the basis $\{\phi_{\alpha}\}$ and upon the particular nuclei which are considered. The author introduces some concepts in the idealized case of infinite nuclear matter. He then turns to actual nuclei. He considers single-particle states which are at positive energy, or are weakly, deeply or semi-deeply bound. Recent theoretical progress on the improvement of the independent particle model is discussed. (81 refs.)

21.10D Binding energy and masses

112054 Nuclear binding energies from moment methods: realistic effective no-core Hamiltonian. F.J.Margetan (Dept. of Energy, Iowa State Univ., Ames, IA, USA), J.P.Vary.

Phys. Rev. C (USA), vol.28, no.2, p.907-15 (Aug. 1983).

Total binding energies for nuclei with $14 \leq A \leq 18$ are obtained from a realistic effective no-core Hamiltonian, H_{eff} , using moment methods. The lowest few moments of H_{eff} are evaluated in an oscillator model space of four major shells. These moments are then used to determine a number of continuous and discrete density of states functions, each of which yields an estimate for the H_{eff} ground state energy. The adjustable discrete density of states functions which we introduce are based upon realistic single-particle Hamiltonians. With a reasonable selection of moment method ingredients the authors obtain good agreement between theory and experiment for relative binding energies within each A chain. The most stable isobar is correctly predicted in all cases and Coulomb energy differences are in close agreement with experiment. Thus, the valley of β stability is well reproduced in this approach with a simple overall shift in absolute binding energies for each A chain. (16 refs.)

112055 Atomic mass of ^{145}Eu derived from relative P_K -ratios. U.J.Schrewe, W.-D.Schmidt-Ott (II. Phys. Inst., Univ. Gottingen, Gottingen, Germany).

Z. Phys. A (Germany), vol.313, no.1-2, p.137-8 (1983).

Using γ -ray spectroscopic methods relative P_K ratios were determined for individual β -transitions in the ^{145}Eu decay. Using the energy dependence of the P_K values the decay energy Q_{EC} was derived to be $Q_{\text{EC}} = 2647_{-10}^{+14}$ keV. The corresponding mass excess for ^{145}Eu of $-78008(15)$ keV is in good agreement with recent reaction studies. (14 refs.)

21.10F Shape, charge, radius and form factors

112056 Spherical, oblate, and prolate nuclear shapes near ^{146}Gd .

R.R.Chasman (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1374-8 (Sept. 1983).

Proton and neutron single particle level spacings are determined for the $A=146$ mass region, using a rotationally invariant interaction and recent experimental data. Excitation energies of spherical and deformed high spin states in ^{146}Gd , the transition probability $B(E2; 10^+ \rightarrow 8^+)$ for several $N=82$ isotones, and the 0^+ excited state spectra of, and neutron pair transfer probabilities for, levels in ^{146}Gd and ^{144}Sm are calculated. Comparisons with experimental data are made. (25 refs.)

112057 Effect of core polarization on the charge distribution in ^{208}Pb . P.Mukherjee, R.Bhattacharya, C.Samanta (Saha Inst. of Nuclear Phys., Calcutta, India).

Phys. Rev. C (USA), vol.28, no.3, p.1396-7 (Sept. 1983).

The coefficients of Fourier-Bessel expansion of charge distribution in ^{208}Pb are determined from the single proton wave functions derived from two sets of optimized Woods-Saxon potentials. The set of potentials optimized with respect to the observed single particle states in ^{208}Pb give excellent agreement with the model independent analysis of the charge distribution. But the potentials obtained from core-polarization corrected single particle states give very poor charge distribution. (8 refs.)

112058 Nuclear shape transitions and some properties of aligned-particle configurations at high spin. T.L.Khoo, P.Chowdhury, H.Emling, D.Frekers, R.V.F.Janssens, W.Kuhn (Argonne Nat. Lab., Argonne, IL, USA), A.Pakkanen, Y.H.Chung, P.J.Daly, Z.W.Grabowski, H.Helppi, M.Kortelahti, S.Bjornholm, J.Borggreen, J.Pedersen, G.Sletten.

Phys. Scr. (Sweden), vol.T5, p.16-20 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

The authors discuss the variation of shapes with spin and neutron number for nuclei in the $N \approx 88$ transitional region. They then present comments on the feeding times of very high spin single-particle yrast states. (18 refs.)

112059 Transition from prolate to oblate to triaxial shapes in ^{158}Yb . M.Jaaskelainen, D.G.Sarantites, F.A.Dilmanian, R.Woodward, H.Puchta (Dept. of Chem., Washington Univ., St. Louis, MO, USA), J.R.Beene, J.Hattula, M.L.Halbert, D.C.Hensley.

Phys. Scr. (Sweden), vol.T5, p.175-7 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

The decay of the entry states in ^{158}Yb populated in the reactions of 149 MeV ^{20}Ne with ^{144}Nd and ^{146}Nd has been investigated with a 4π multidetector system gated by a Ge counter. The average excitation energy, the γ -ray spectra and the angular distributions as a function of multiplicity show several changes in the γ -ray decay. These changes suggest a transition from prolate to particle aligned oblate configuration at low spin. At $I \approx 38-48$ collective transitions with dipole and quadrupole component possibly built on high K single particle states are observed. Furthermore, above $I \approx 48$ the dipole component disappears suggesting a further change toward more triaxial shape. (16 refs.)

112060 Shape coexistence and other aspects of nuclear structure in ^{40}Ar . E.Bitterwolf, A.Burkard, P.Betz, F.Glatz, F.Heidinger, Th.Kern, R.Lehmann, S.Norbert, H.Ropke, C.Schneider, J.Siefert (Fakultat fur Phys., Univ. Freiburg, Freiburg, Germany).

Z. Phys. A (Germany), vol.313, no.1-2, p.123-32 (1983).

The γ -decay of ^{40}Ar has been studied by particle- γ coincidence measurements in the $^{37}\text{Cl}(\alpha, p\gamma)$ reaction at 12 and 13 MeV bombarding energy. Particle- γ angular correlations and linear polarizations of γ -rays were measured at 12 MeV. A lifetime measurement using the Doppler-shift attenuation method was performed at 11 MeV. The coexistence of spherical and deformed states in ^{40}Ar could be concluded from the observation of a $K^\pi = 0^+$ rotational band which has its $I^\pi = 0^+$ through 6^+ members at 2121, 2524, 3515 and 4959 KeV excitation energy. The intrinsic quadrupole moment derived from $B(E2)$ values is $|Q_0| = 1320_{-120}^{+60}$ mb. Negative-parity states with high spin were observed at $4.858(5^-)$, $4.494(5^-)$, $4.226(4^-)$ and 4991 KeV (4^-) excitation energy. A complete account of all levels below 5 MeV excitation energy is obtained by a model in which two $d_{3/2}$ proton holes couple weakly to the ^{42}Ca levels below 4.75 MeV excitation energy. (21 refs.)

21.10H Spin, parity, and isobaric spin

112061 On the use of isomer ratios in ^{44}Sc for predicting spin populations in high energy heavy-ion nuclear reactions. H.Groening, K.J.Moody, G.T.Seaborg (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.317-20 (1 Sept. 1983).

From fits of isomer ratio as a function of projectile kinetic energy the authors have calculated the centroids in the E - J plane for the $^{44}\text{Sc}^*$ population generated in the reactions $^{29}\text{Si}(^{18}\text{O}, p2n)^{44m}\text{Sc}$ and $^{41}\text{K}(\alpha, n)^{44m}\text{Sc}$. It is shown that ^{44}Sc isomer ratios can be used to predict average spins in $^{44}\text{Sc}^*$,

particularly if such ratios are low. As isomer ratios increase, unique identification of average spin populations becomes more difficult because average excitation energy becomes important in determining the isomer ratio. (15 refs.)

112062 Spin-isospin ordered shell model states in nuclei. G.Giberti, N.Lo Iudice, G.Varaccio (Istituto di Fisica Teorica, Univ. di Napoli, Sezione di Napoli, Napoli, Italy).

Phys. Rev. C (USA), vol.28, no.2, p.888-93 (Aug. 1983).

Several shell model configurations entitled to describe a spin-isospin phase in nuclei are analyzed at different nuclear densities and deformations in the region $A=12-36$. Shell effects are found to be dominant. As a result, the spin-isospin alignment ($\sigma_3\tau_3 = +1$ or $\sigma_3\tau_3 = -1$) is most favored in nuclei around $A=28$ because of their distinctive shell model structure. Moreover, in a given nucleus an energy gain over the normal and other possible phases can be obtained at reasonably low densities, if a fraction rather than the totality of nucleons have the same spin-isospin alignment. The analysis of the results strongly suggests that the ordered phase should be described by a correlated shell model state composed of a suitable number of these partially ordered configurations. The relevance of the results to possible collective properties of properly chosen nuclei at ordinary density is pointed out. (10 refs.)

112063 Spin and isospin characteristics of the excited states of ^{36}Ar through the reaction $^{32}\text{S}(\alpha, \gamma)^{36}\text{Ar}$ in the bombarding energy range $E_\alpha = 4$ to 5 MeV. D.R.Chakrabarty, M.A.Eswaran, N.L.Ragoowansi (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India).

Phys. Rev. C (USA), vol.28, no.3, p.1012-24 (Sept. 1983).

The α capture reaction $^{32}\text{S}(\alpha, \gamma)^{36}\text{Ar}$ was studied in the bombarding energy range of $E_\alpha = 4.13$ to 5.00 MeV corresponding to the excitation energy range of $E_x = 10.31$ to 11.08 MeV in ^{36}Ar . Seven resonances have been located and their resonance strengths determined. Two of the resonances decay predominantly to the ground state while the other five decay predominantly to the first excited state of ^{36}Ar . Angular distribution measurements of the predominant decay gamma ray have been performed and the spin and parity of all the resonances assigned. The isospin of two of the resonances have been assigned as $T=0$ while $T=1$ has been assigned for three others. Evidence has been obtained for the operation of the isospin selection rule for the dipole ($E1$ and $M1$) and quadrupole ($E2$) gamma decay. (16 refs.)

112064 Simple isospin relations for transitions in $A=13$. R.J.Peterson (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA).

Phys. Scr. (Sweden), vol.T5, p.190-2 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).

The isospin symmetry breaking noted in pion inelastic scattering on ^{13}C has been shown previously to be consistent with helium-ion scattering and charge exchange data. Here, proton scattering and charge exchange data at a beam energy of 26.1 MeV are shown to exhibit rather different features. Since the great isospin asymmetries are found for stretched-spin states very near the proper nucleon decay thresholds, it is suggested that external mixing is responsible for the consistent observations for strongly absorbed projectiles, but that nucleon beams are sensitive to different radial locations and so the proton-induced data may not be related simply to more surface dominated data. (26 refs.)

112065 Breaking of fundamental symmetries in nuclei. E.G.Adelberger (Max-Planck-Inst. fur Kernphys., Heidelberg, Germany).

Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.55-91

Nuclei are interesting systems in which to study symmetry breakdowns because of the rich variety of phenomena one can observe. The nucleus 'feels' the strong, electromagnetic (EM) and weak interaction which respect differing sets of fundamental symmetries so that one expects a hierarchy of symmetry breaking effects. The author discusses the breaking of 2 symmetries-isospin (I) which is respected by the strong interaction but broken by electromagnetism, and parity (P) which is violated only by the weak interaction. These two examples in some sense span the space of symmetry-breaking effects. The ratio of the EM to the strong force felt by a pair of nucleons is roughly $Z\alpha$ so that isospin is quite obviously broken in nuclei. Nevertheless in many cases the symmetry is better than one would expect from elementary considerations. Because I-breaking effects are so obvious and easily measurable it provides a nice understandable example of a broken symmetry and the author discusses it in some detail. (32 refs.)

112066 Electromagnetic properties of isomers in ^{210}Pb . D.J.Decman, J.A.Becker, J.B.Carlson, R.G.Lanier, L.G.Mann, G.L.Struble (Lawrence Livermore Nat. Lab., Livermore, CA, USA), K.H.Maier, W.Stoffl, R.K.Sheline. *Phys. Rev. C (USA)*, vol.28, no.3, p.1060-4 (Sept. 1983).
 The lifetimes and magnetic moments of the $J^\pi=8^+$ and 6^+ isomers in ^{210}Pb have been measured using the gamma-ray perturbed angular distribution technique. The levels were populated with the $^{208}\text{Pb}(t,p)^{210}\text{Pb}$ reaction. The g factors of the 8^+ and 6^+ states are found to be $-0.312(8)$ and $-0.312(15)$, respectively. The magnetic moment, $\mu=-1.42(7)\mu_N$, is deduced for the $2g_{7/2}^+$ neutron orbital. Mean lifetimes are $290(25)$ ns for the 8^+ state and $71(9)$ ns for the 6^+ state. The authors find $\langle g_{7/2}^2 \rangle / M(E2) \parallel \langle g_{7/2}^2 \rangle = -39(2) e\text{ fm}^2$ and an effective charge of $0.88(5) e$ for the $2g_{7/2}^+$ neutron orbital. (17 refs.)

21.10M Level density and structure

112068 On the parity dependence of nuclear level densities. G.Maino, A.Ventura (Div. Fisica e Calcolo Sci., ENEA, Bologna, Italy). *Lett. Nuovo Cimento (Italy)*, vol.37, ser.2, no.16, p.561-8 (20 Aug. 1983).
 The parity distribution of nuclear excited states is investigated in the frame of a statistical formalism based on realistic single-particle and collective configurations, and particularly suitable to the study of odd-mass, or odd-odd nuclei. Numerical results are presented for spherical nuclei in the mass range $A=48-65$. (8 refs.)
 112069 Shell-model calculations of high-spin isomers in neutron-deficient $1g_{7/2}$ -shell nuclei. K.Ogawa (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan). *Phys. Rev. C (USA)*, vol.28, no.2, p.958-60 (Aug. 1983).
 The neutron-deficient $1g_{7/2}$ -shell nuclei are studied in the framework of the shell model with the $(1g_{7/2}, 2p_{1/2})^{-n}$ configuration. Several 'spin-gap' isomers with a half-life of an order of a second are predicted in ^{95}Pd , ^{95}Ag , ^{96}Cd , and ^{97}Cd . Among them, the $J=21/2^+$ state in ^{95}Pd is predicted to be an isomer which corresponds to $^{95}\text{Pd}^m$ recently observed by Nolte and Hick. It is also shown that the high-spin isomers above the proton threshold are rather stable against the proton emission. (15 refs.)
 112070 1p-2h and 2p-3h states in ^{15}C . S.Truong, H.T.Fortune (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.977-9 (Sept. 1983).
 The reaction $^{13}\text{C}(t,p)$ has been used to locate 1p-2h and 2p-3h states in ^{15}C . The results for the negative-parity levels are in good agreement with expectations for $(sd)^2 L=0, 2$, and 4 transfers as given by $^{14}\text{C}(t,p)^{16}\text{C}$. (11 refs.)
 112071 Level structure of ^{67}Ge and its implications for the general structure of nuclei in the 1f-2p shell. M.J.Murphy, C.N.Davids (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1069-79 (Sept. 1983).
 From the results of prompt and β -delayed γ -ray singles and γ - γ coincidence measurements, twenty-four excited states and forty-six gamma transitions are identified in the level scheme of ^{67}Ge . Angular distributions and directional correlations of prompt ^{67}Ge gamma rays have been measured to obtain the spins of the ^{67}Ge ground state and excited states at 18.2, 122.7, 243.6, 711.3, and 1019.9 keV. Parities are assigned to the first five states on the basis of fp shell systematics and observed ^{67}Ge gamma-ray branching ratios. The 752-keV excitation energy of the first $9/2^+$ level in ^{67}Ge is determined from an excitation function for the $^{64}\text{Zn}(\alpha,n\gamma)^{67}\text{Ge}$ reaction. The angular distribution and correlation measurements also provide $E2/M1$ mixing ratios for the 104.4, 120.8, 122.7, 243.6, 589.0, and 897.5 keV ^{67}Ge gamma rays. The level scheme of ^{67}Ge and the corresponding schemes for $^{63,65}\text{Ni}$, $^{65,67}\text{Zn}$, and ^{69}Ge are observed to have strong similarities at low excitation. Systematic trends in $E2$ transition rates are interpreted in the context of shell and collective features of the nuclei. It is found that models based on a single particle coupled to a vibrational or deformed core do not explain the observed systematics, and are an inaccurate representation of these nuclei. The systematics do agree with a many-nucleon shell model emphasizing the short-range pairing interaction and configuration mixing for the valence neutrons. (18 refs.)

112072 ^{234}U levels fed in the ^{234}Np electron capture decay. C.Ardisson-Marsol, G.Ardisson (Lab. de Chimie Phys. et Radiochimie, Univ. de Nice, Nice, France). *Phys. Rev. C (USA)*, vol.28, no.3, p.1334-42 (Sept. 1983).
 The decay of ^{234}Np has been investigated using a coaxial Ge(Li) detector. The source prepared by the $^{235}\text{U}(d,3n)$ reaction was purified from fission products by radiochemical separation. The analysis of the γ ray spectra revealed the presence of 59 photon lines, 29 of which were found for the first time. The absolute values of γ , EC, and β^+ intensities were deduced from Ux-K ray intensity. A ^{234}U decay scheme is suggested on the basis of the good sum relationships. Accurate values of 17 low-spin-energy levels are given, 6 of which were previously unreported in the ^{234}Np decay: 849.36(03 $^-$), 926.33(22 $^+$), 989.41(22 $^-$), 1457.1(12 $^-$), 1500.88(1), and 1510.22(2) keV. (35 refs.)
 112073 Implications of the recently discovered $^{208}\text{Pb}(1^+, E_x=5.845\text{ MeV})$ state for the spin-dependent nuclear interaction. H.Toki, G.F.Bertsch, D.Cha (Dept. of Phys., Michigan State Univ., East Lansing, MI, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1398-401 (Sept. 1983).
 Measurements on the newly discovered 1^+ state at $E_x=5.845\text{ MeV}$ in ^{208}Pb provide an opportunity to examine the spin dependence in the nuclear effective Hamiltonian. The data require a somewhat weaker spin-orbit splitting than given by conventional Hamiltonians. The isoscalar spin-dependent residual interaction, which was poorly determined by previous data, is found to be much weaker than the isovector spin-dependent interaction, as predicted by Brueckner theory. (21 refs.)
 112074 Deformation aligned states. P.M.Walker (Daresbury Lab., SERC, Warrington, England). *Phys. Scr. (Sweden)*, vol.T5, p.29-35 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
 Experimental information on multi-quasiparticle isomers is compared, with special emphasis on the hafnium isotopes. New results for ^{174}Hf are presented. The co-existence of deformation-aligning and rotation-aligning influences is considered. Residual interactions are studied as a function of the number of quasiparticles, with large effects being evident for large numbers of quasiparticles. (21 refs.)
 112075 A study of the nuclear structure at high energy and low spin. J.Rekstad, A.Henriquez, F.Ingebretsen, G.Midditt, B.Skaali, R.Oyan, J.Wikne, T.Engeland (Inst. of Phys., Univ. of Oslo, Oslo, Norway), T.F.Thorsteinen, E.Hammaren, E.Liukkonen. *Phys. Scr. (Sweden)*, vol.T5, p.45-50 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
 A novel method to study nuclear structure at low spin as a function of temperature is developed and used on $^{146,148}\text{Sm}$, $^{154,156}\text{Gd}$ and $^{160,162}\text{Dy}$, by means of the $(^3\text{He}, \alpha)$ reaction. The nuclear level density for a wide energy range is also studied. The γ -multiplicities and the first generation γ -ray spectra indicate a structure change in deformed nuclei at about 6 MeV. (6 refs.)
 112076 Isoscalar character of the 1^+ state at 5.844 MeV in ^{208}Pb . G.P.A.Berg, W.Hurlimann, I.Katayama, S.A.Martin, J.Meissburger, J.G.M.Romer, B.Styczen, J.L.Tain (Inst. fur Kernphys., Kernforschungsanlage Julich, Julich, Germany).
 Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.214-22
 High resolution proton and deuteron inelastic scattering angular distributions leading to the lowlying 1^+ spin-flip state at $E_x=5.844\text{ MeV}$ will be presented and discussed in the context of recent studies of this state by several different reactions. From the equally strong excitation in proton and deuteron scattering the predicted isoscalar character of this state is supported. For the proton scattering microscopic DWBA calculations will be shown and discussed. (23 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

112077 Tensor forces in the three-body problem. A.Osman (Internat. Centre for Theoretical Phys., Trieste, Italy). *Atomkernenerg. Kerntech. (Germany)*, vol.42, no.1, p.57-60 (1983).
 The three-body problem is considered using separable two-body interactions. The two-body potentials used contain both attraction and repulsion. Each of the attractive and repulsive parts of the two-body potentials also include tensor forces. The effect of the tensor forces is investigated by making use of the separable approximation. By introducing the separable expansion in the three-body problem, the Faddeev equations are reduced to a well-behaved set of coupled integral equations. The integral equations obtained are solved numerically using separable two-body interactions with potential functions of the Yamaguchi, Gaussian, Tabakin, Mongan and Reid forms. The calculated values of the binding energies for the nuclei ^3H , ^3He and ^6Li are in good agreement with the experimental values. The effect of the tensor forces is found to improve the binding energy by about 4.491% to 8.327%. (37 refs.)

112078 Configuration space Faddeev continuum calculations: p-d s-wave scattering length. J.L.Friar, B.F.Gibson (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), G.L.Payne.

Phys. Rev. C (USA), vol.28, no.3, p.983-94 (Sept. 1983).

Formulation of s-wave zero-energy Faddeev-type scattering equations including a Coulomb interaction is discussed. Numerical solutions of these equations for the s-wave NN potential models of Malfliet and Tjon (1969) are obtained using spline techniques. Kohn variational estimates are presented and comparison is made to previously published results. The quartet pd scattering lengths are larger than others previously obtained, and the pd doublet results are smaller than the corresponding nd results, and thus in contrast to the experimental values. An explication of this feature is presented in terms of a model two-body problem. Perturbation theory for the Coulomb corrections to the scattering length is developed and confirms the Kohn estimates. (33 refs.)

112079 Spurious bound states in relativistic three-body equations. H.Garcilazo (Dept. of Phys., Texas A&M Univ., College Station, TX, USA), L.Mathelitsch.

Phys. Rev. C (USA), vol.28, no.3, p.1272-6 (Sept. 1983).

The authors point out that the most commonly used version of the relativistic Faddeev equations has spurious bound-state solutions and therefore it is unsuitable for calculations in the bound-state region. They propose a way to modify these equations which would correct the problem, but which leads to the loss of the clustering property. They present numerical examples for the case of the π^-nn system. (10 refs.)

112080 Theory for a hybrid quark-baryon model for the nucleon-nucleon system. E.M.Henley, L.S.Kisslinger, G.A.Miller (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1277-85 (Sept. 1983).

A hybrid quark model for two baryons is developed. The short distance part is represented by six-quark wave functions, while the long distance part is described by conventional wave functions representing the relative motion of three-quark baryons. Formulae which give the probabilities of the six-quark configurations as a function of energy, in terms of the exterior NN interactions and experimental phase shifts, are derived and applied. (16 refs.)

112081 Coulomb plus separable potential in coupled channels. W.Schweiger, W.Plessas (Inst. for Theoretical Phys., Univ. of Graz, Graz, Austria), L.P.Kok, H.van Haeringen.

Phys. Rev. C (USA), vol.28, no.3, p.1414-16 (Sept. 1983).

The two-potential formalism for long-range forces is generalized to coupled channels. Assuming the short-range potential to be separable the authors treat the proton-proton interaction in the coupled partial waves 3P_2 - 3F_2 . They derive the corresponding Coulomb-modified nuclear transition matrices in closed analytic form and calculate the Coulomb distortion of the phase shifts and of the mixing parameter. The separable parametrization proposed for the p-p interaction in 3P_2 - 3F_2 yields an accurate fit to the experimental data available for these channels. The potential completes the description of the N-N interaction by the Graz-II separable model. (12 refs.)

112082 On parity- and angular-momentum-dependence of inter-nucleon potential. K.Aoki, H.Horiuchi (Dept. of Phys., Kyoto Univ., Kyoto, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.826-30.

The parity-dependence and the angular-momentum-dependence of the inter-nucleon potential are investigated by analyzing the equivalent local potential of $Z+^4\text{He}$, $Z+^{16}\text{O}$, $Z+^{40}\text{Ca}$ systems. A parameter is proposed to judge the importance of the parity-dependence among systems. The parity-dependence in all the Z -core systems is found to be governed by the same mechanism. The behaviour of the l -dependence is understood in connection with the parity-dependence. (4 refs.)

112083 Δ dynamics. E.J.Moniz (Center for Theoretical Phys., MIT, Cambridge, MA, USA).

Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.251-83.

The author discusses the properties and interactions with nuclei of Δ s. An isobar model is developed which allows one to discuss precisely the propagation and dynamics of the Δ as an 'unstable particle'. The need for the discussion is grounded in the apparently very different descriptions of the Δ offered by conventional meson-nucleon scattering theory and by the quark model. The phenomenological isobar model is compatible with both languages. The model provides a dynamically consistent approach to the many-body problem, and leads to dynamical modifications of quark model predictions of Δ properties. The author discusses the extraction of Δ -nucleus interaction parameters from an analysis of intermediate energy pion- and photon-initiated nuclear reactions. The central result is the strength of the Δ -nucleus optical potential, which is found to have a large imaginary part associated with intermediate coupling to purely nuclear states. The role of Δ s in low energy nuclear properties is discussed briefly. (25 refs.)

112084 Non-locality of the deuteron optical model potential due to coupling to inelastic channels. G.H.Rawitscher (Phys. Dept., Univ. of Connecticut, Storrs, CT, USA), G.Delic.

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.590-9.

A new formulation is being developed for investigating the non-local part of the elastic optical potential, as well as that for the inelastic DWBA transition potential, which is due to coupling to a set N of inelastic channels. The method consists in using a basis set of Sturmian functions, one for each channel. The dimension of the set is truncated to a finite number M , and the elements of a $(N \times M)^2$ dimensional matrix are calculated. The truncation error can subsequently be removed by a sequence of iterations which converge. Applications to the case of 21.6 MeV deuterons incident on the nucleus of nickel is described, in which coupling to a discretized breakup space is taken into account. The non-local elastic optical potential is characterized in terms of the spectrum of its Sturmian eigenvalues. (10 refs.)

21.60C Shell model

112087 Boson mapping in the deformed Nilsson scheme. H.T.Chen, S.Y.Lee, L.Lin, S.F.Tsai.

Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan), vol.12, p.254 (Dec. 1982).

[received: Sept. 1983]

The authors analyze the importance of S and D bosons in the Dyson boson mapping of the deformed Nilsson scheme, i.e. $a^\alpha a^\beta \dots R^{\alpha\beta} = B^{\alpha\beta} - B^{\alpha\gamma} B^{\beta\gamma} B_{\gamma\delta}$, $a_\alpha a_\beta \dots R_{\alpha\beta} = B^{\alpha\gamma} B_{\gamma\beta}$, where α, β, γ and δ are the appropriate quantum numbers for the Fermion states in the Nilsson orbit, they have used the convention that a^α and a_β are fermion creation and annihilation operators for state α and β respectively. Double indices in the above equations are summed implicitly. Based on the Dyson mapping, the authors can obtain the analytic solution for the Nilsson Hamiltonian with pairing interaction. (no refs.)

112088 Dynamical content of the shell model. C.Mahaux (Inst. de Phys., Univ. de Liege, Liege, Belgium), H.Ngo.

Phys. Scr. (Sweden), vol.T5, p.74-9 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglo, Denmark, 16-20 Aug. 1982).

A critical discussion is given of several recent attempts to introduce dynamical content in the shell model by means of adding corrections to the Hartree-Fock approximation. Numerical results are given for single-particle neutron energies in ^{208}Pb . (43 refs.)

112089 Influence of shell structure on deep inelastic collisions. Wu En-chiu (Inst. of Modern Phys., Acad. Sinica, Peking, China), K.D.Hildenbrand, A.Gobbi, A.Olmi, H.Sann, H.Friesleben, U.Lyden.

Phys. Energ. Forts & Phys. Nucl. (China), vol.7, no.3, p.379-94 (May 1983). In Chinese.

A kinematically complete study of the symmetric systems $^{154}\text{Sm}+^{154}\text{Sm}$ and $^{144}\text{Sm}+^{144}\text{Sm}$ has been performed at energies 30% in excess of the interaction barrier. They have been chosen because of their different internal structure: ^{144}Sm has a closed $N=82$ neutron shell and hence a spherical ground state configuration; ^{154}Sm with ten neutrons outside this shell is strongly deformed. Over the whole range of kinetic energy loss the variances of the measured mass distributions were found to be similar in both reactions, whereas the variances of the element distributions are considerably larger at small energy losses in the ^{144}Sm system. Based on the shell-corrected potential energy surface these observations are attributed to the closed $N=82$ neutron shell which, for ^{144}Sm , hinders the neutron exchange and leads to a preferential transfer of protons. (11 refs.)

112090 Symmetry aspects of the shell model. P.W.M.Glaudemans (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).

Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.119-49.

The author has shown that the shell model can produce states which exhibit pure collective properties. It turns out that the nuclei in the middle of the fp shell are very good candidates for an investigation of the relation between the

microscopic and the collective interpretation. In the present phenomenological approach the shell model and the axially symmetric rotor are related to each other by a comparison of the numerical values of their observables. It would be very interesting to further study this relation by investigating whether collective states are related to possible cluster structures of the corresponding shell-model wave functions. Shell-model wave functions always contain an unphysical part, which corresponds to the center-of-mass motion of the nucleus. This may lead to spurious effects when calculating various observables. It is shown that under certain conditions the spurious effects can be isolated exactly from the nonspurious ones. The method has been applied to calculate various observables in p-shell nuclei. The translationally-invariant effective interaction has been obtained from a least-squares fit to the data. Because of the requirement of translational invariance the Hamiltonian can be expressed in a rather small number of parameters. (19 refs.)

112091 General principles of statistical spectroscopy. J.B.French (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure*, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.177-202. In the shell-model there is an implicit argument that, while the high states are not well treated, their effects on the low-lying states are, especially when one takes account of renormalizations of the Hamiltonian. In the author's case the high-lying states cannot be hidden, their centroid and width being basic parameters of the theory; but if the model spaces are not too large we can rely on a central limit theorem (CLT) to 'propagate' downwards from the centroid, and on a theorem of 'spectral rigidity' to keep the local fluctuations in check. For larger spaces a method of partitioning, when combined with these theorems, will do the same things. The author stresses that, whereas ordinary shell-model methods produce numerical values for quantities of interest, it is the author's aim to produce them as functions of the parameters of the system. In particular one should think of the spectrum as an immensely complicated structure which may display regularities both in its secular behavior and its fluctuations. Its levels move around as one varies the Hamiltonian matrix elements, these motions, under small variations of the elements, then informing about quantities of interest, expectation values, transition strengths and so forth, in a manner quite analogous to the way in which parametric derivatives on a partition function yield corresponding information. (28 refs.)

112092 Systematic analysis of medium heavy spectroscopy in the interacting-boson model. H.C.Chiang, S.T.Hsieh, M.M.King, S.Y.Lee. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.255-6 (Dec. 1982). [received: Sept. 1983]
The interacting boson model (IBM) is a very useful theoretical tool in the spectroscopy of the medium heavy deformed nuclei. IBM assumes that the nucleon pairs can be considered as a boson where the bosons with angular momentum 0 and 2 dictate the low-lying spectrum of the nucleus. Several attempts in fitting the Hamiltonian to a series of nuclear spectra have been performed. Yet these efforts are limited by the limited number of parameters used. A much more general χ^2 -fitting is still lacking. The authors calculate the spectra and the transition rate of the rare earth nuclei systematically to understand the physical meaning of the parameters in equation. (no refs.)

112093 Rotational motion at finite temperature. J.Kunz (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA), U.Mosel. *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.269-84 (19 Sept. 1983). Moments of inertia and rotational velocity fields are calculated in the cranking model for the harmonic oscillator and the Nilsson potential for even-even rare earth nuclei. By means of a temperature-averaging procedure these quantities are decomposed into a smooth and a shell-structure-dominated part. The results are in good agreement with the corresponding Strutinsky-averaged results. The velocity fields are analyzed in terms of vector spherical harmonics and compared to rigid flow. The smooth velocity fields reveal rigid flow in the nuclear interior; in the surface region a deviation from rigid flow occurs, giving rise to a backflow in the inner system. The temperature dependence of the smooth moment of inertia is approximated by a quadratic function. (37 refs.)

112094 Coupling of surface and bulk vibrations in the nuclear breathing mode. M.Brack (Inst. fur Theoretische Phys., Univ. Regensburg, Regensburg, Germany), W.Stocker.

Nucl. Phys. A (Netherlands), vol.A406, no.3, p.413-34 (26 Sept. 1983). The authors treat a general class of dynamical couplings of the surface to the bulk of a spherical nucleus during isoscalar breathing vibrations. Compressibilities are evaluated in the extended Thomas-Fermi approximation using a realistic Skyrme force (SkM*). Inertial parameters are obtained in a hydrodynamical framework. The lower of the two eigenmodes is found to be close in energy to the pure bulk vibration (and to the scaling mode), and to be in excellent agreement with the experimental giant monopole resonance energies. The coupling of surface and bulk vibrations shifts the pure surface mode to appreciably higher energies (~ 25 MeV in ^{208}Pb). This upper mode, which has a pronounced anti-scaling behaviour, might be identified through the analysis of its transition density. (31 refs.)

112095 Potential energy surfaces in the classical limit of the IBM-2. A.B.Balantekin, B.R.Barrett, S.Levit (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.153-6 (22 Sept. 1983). The classical limit of the Interacting Boson Model for both neutrons and protons (the IBM-2) is investigated. In particular, general expressions of the potential energy for the proton and neutron distributions aligned along the same axis are obtained and plotted for the even-even isotopes of tungsten. (10 refs.)

112096 Dynamical groups of liquid drop models. R.Gilmore, Da Hsuan Feng, M.Vallieres (Dept. of Phys. & Atmospheric Sci., Drexel Univ., Philadelphia, PA, USA), J.L.Wood. *Phys. Rev. C (USA)*, vol.28, no.2, p.903-6 (Aug. 1983). Two inequivalent quantum mechanical versions of the liquid drop model can be obtained, depending on whether the classical volume conservation condition is imposed to first or second order. These two models have dynamical groups $\text{IU}(5)$ and $\text{U}(6)$, respectively. The two models are related to each other through standard group contraction and group expansion procedures. (7 refs.)

112097 Deformed bosons in the Nilsson scheme. S.Y.Lee, S.F.Tsai (Inst. of Phys., Acad. Sinica, Taiwan), H.T.Chen, L.Lin. *Phys. Rev. C (USA)*, vol.28, no.2, p.955-7 (Aug. 1983). Dyson boson mapping is used to derive the deformed boson from the Nilsson Hamiltonian. Single j -shell Nilsson model with pairing interaction is treated as an example. A general method of reconstructing bosons with definite angular momentum is outlined. (7 refs.)

112098 Microscopic basis of collective symmetries. A.Arima (Dept. of Phys., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan). *Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure*, Dronten, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.93-117. The author discusses mainly the seniority scheme, i.e. $\text{SU}(2)$ symmetry, in single closed shell nuclei. Conditions are shown for an effective interaction to conserve seniority. Then an approach to a microscopic basis of the interacting boson model is very briefly sketched. (17 refs.)

21.60G Cluster models

112099 High excited α cluster state calculation of nuclei. S.Y.Lee, E.K.Lin, C.W.Wang. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.238 (Dec. 1982). [received: Sept. 1983]
Recent studies on the intermediate structure of the light heavy ion reaction indicate that the cluster configuration may be the origin of the intermediate structure ($\Delta E \approx 600$ keV, $\Gamma \approx 400$ keV) (Lee, Wilschut, and Ledoux, 1982). The authors perform a cluster model calculation based on the method developed by Bloch and Brink. The single particle wave functions of nucleons are assumed to be the Gaussian. The Slater-determinant $|\phi\rangle$ of the trial wave function for 4 N nucleons is used to calculate the energy from the variational principle. Based on the Brink-Boeker force, or the N-N interaction derived from the shell model calculation by Hsieh et al., they calculate the high excited states of ^{24}Mg with ^{12}C - ^{12}C configuration, α - ^{20}Ne configuration and α - ^{16}O - α configuration to investigate the relevance of these cluster states in the heavy ion reaction of $^{12}\text{C} + ^{12}\text{C}$ system. (no refs.)

112100 Role of finite boson number in the interacting boson approximation description of $\gamma \rightarrow g$ transitions in deformed nuclei. R.F.Casten, D.D.Warner (Brookhaven Nat. Lab., Upton, NY, USA), A.Abrahamian. *Phys. Rev. C (USA)*, vol.28, no.2, p.894-902 (Aug. 1983).
The effect of finite boson number in the interacting boson approximation is one of its most distinguishing features. These effects are investigated in terms of the deviations of $\gamma \rightarrow g$ band $E2$ transitions from the rotational (Alaga) values which provide one of the most crucial tests of collective models of deformed nuclei. It is shown that the empirical systematics of these deviations displays a strong mass dependence, that the interacting boson approximation successfully reproduces these systematic trends, and does so primarily by virtue of the variations in boson number and not because of parameter variations. Moreover, the origin of the N dependence lies in the characteristic way in which the $\text{SU}(3)$ symmetry is broken in calculations for realistic deformed nuclei and involves, in an essential way, the N dependence of the $\text{SU}(3)$ $\gamma \rightarrow \beta$ transitions. 112101 Multipole pair fields at finite temperature. K.Muhlans, E.M.Muller, U.Mosel (Inst. fur Theoretische Phys., Univ. Giessen, Giessen, Germany), A.L.Goodman. *Z. Phys. A (Germany)*, vol.313, no.1-2, p.133-5 (1983).
Finite temperature HFB calculations have been performed in a model using the Surface Delta Interaction as the generating two body force. The $T=0$ as well as the $T=1$ multipole pair fields are studied at various temperatures and different angular momenta. Higher multipole modes appear not only to be more resistant against increasing angular frequency but also against increasing temperature in comparison with the standard monopole pairing mode. 21.65 NUCLEAR MATTER

112102 New elements at the limit of stability of nuclear matter. The path to elements 107 and 109. G.zu Putlitz, G.Siegert (Gesellschaft fur Schwerionenforschung mbH, Darmstadt, Germany). *Naturwissenschaften (Germany)*, vol.70, no.8, p.383-7 (Aug. 1983). In German.

Man-made heavy-element production, previously accessible by successive neutron capture, has entered a new age by the invention of powerful heavy-ion accelerators. New insight in the fusion process and new experimental techniques have led to the discovery of two new elements with charge numbers 107 and 109 at GSI, the German Heavy Ion Research Laboratory. The production of very neutron-deficient Lu and Tm isotopes resulted in the discovery of a new mode of radioactive decay, proton radioactivity. Slow fusion of systems with nearly 500 nucleons as well as the dynamics of very fast fission processes have been studied. The future development investigating the properties of nuclear matter aims at high energy compression phenomena onsets of which have been discovered recently by a joint group from GSI Darmstadt and the Lawrence Berkeley Laboratory. (no refs.)

112103 Nucleon currents between highly excited nuclei. M.P.M.Barranco, X.Vinas (Facultad de Fisica, Univ. de Barcelona, Barcelona, Spain), C.Ngo, E.Tomasi.

Nucl. Phys. A (Netherlands), vol.A406, no.2, p.325-38 (19 Sept. 1983).
A finite temperature Thomas-Fermi method has been used to study the nucleon transfer between two hot slabs of symmetric nuclear matter. Special attention has been paid to temperature effects neglected in earlier calculations. As a result, closed and ready-to-use formulas for the exchange and transfer nucleon flux at zero relative momentum are given as a function of the temperature. (21 refs.)

112104 On clustering effects and phase instabilities in high energy nuclear collisions. O.Civitarese, A.Plastino (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany). *Z. Phys. A (Germany)*, vol.313, no.1-2, p.139-40 (1983).
Recent evidences concerning cluster formation in high energy nuclear collisions are analyzed within a 'lattice' approach for nuclear matter at finite temperature. (10 refs.)

21.80 HYPERNUCLEI

112105 A microscopic study on the particle-decay widths of excited states in light Δ -hypernuclei. T.Yamada, K.Ikeda (Dept. of Phys., Niigata Univ., Niigata, Japan), T.Motoba, H.Bando. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.901-5.
A systematic study of $A=6-9$ p-shell Δ -hypernuclei as well as $^{21}_{\Delta}\text{Ne}$ is carried out within the framework of the microscopic $\alpha + x + A$ three-cluster model dynamics ($x=n, p, d, t, \alpha$ or ^{16}O). The energy spectra can be classified into several characteristic 'bands' according to the underlying structures. The properties of resonance states, e.g. 'narrow' peak widths in the (K^-, π^-) reaction, are shown to be successfully explained by solving the coupled channel scattering equation. (5 refs.)

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

112106 Determination of the multipolarity of prompt electromagnetic transitions from angular distributions of conversion electrons. I. Method. H.R.Faust (Inst. Laue-Langevin, Grenoble, France). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.271-5 (1 Aug. 1983).
The formalism for the angular distribution of conversion electrons from aligned states is described for transitions with multipole order ≤ 2 . It is shown that the determination of the leading term in both the e^- and γ angular distribution function provides an excellent method for assigning multipolarities $E1, M1, E2$ and $(M1+E2)$ to prompt decay lines. The applicability of the method is investigated for different spins, electron energies and Z -values. The influence of attenuation factors in angular distribution measurement is discussed and the effect on the multipole assignment is examined. (8 refs.)

112107 Determination of the final nucleus density matrix by measuring the angular correlation of charged particles and γ -quanta in various planes. N.S.Zelenskaya, I.B.Teplov (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR). *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.306-24 (19 Sept. 1983).
The measurements of the angular correlation function of charged particles and γ -quanta emitted by a final even-even nucleus in state J_f in different planes of γ -quantum ejection with respect to the reaction plane have been shown to offer the unique possibility of restoring all the even-rank components of the model-less density matrix in the transitions with $J_f=L$ (L is the multipolarity of the γ -transition). The minimum number of planes in which the angular correlation function should be measured to restore the density matrix has been found. The formulas relating the components of the model-less density matrix to the polarization characteristics of an even-even nucleus in a given state have been obtained. (15 refs.)

112108 Parametrization of the short-range correlation and exchange matrix elements by the Landau-Migdal parameters. T.Suzuki (Dept. of Phys., Nihon Univ., Tokyo, Japan). *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.157-61 (22 Sept. 1983).
The effects of the short-range correlation and the exchange part of two-body matrix elements in the particle-hole and Δ -hole excitation contributions in M1 form factors are parameterized by the Landau-Migdal parameters g'_N and g'_Δ . The momentum transfer (q) dependences of the parameterized values of g'_N and g'_Δ are investigated. (11 refs.)

112109 Band crossing in ^{130}Ba . Sun Xiangfu (Inst. of Modern Phys., Acad. Sinica, Lanzhou, China), D.Bazzacco, W.Gast, A.Gelberg, U.Kaup, A.Dewald, K.O.Zell, P.von Brentano. *Phys. Rev. C (USA)*, vol.28, no.3, p.1167-70 (Sept. 1983).
A complex band crossing of the yrast band has been observed at spin $I=10$ in ^{130}Ba by the reaction $^{120}\text{Sn}(^{13}\text{C}, 3n\gamma)$. Two of the three positive parity bands show backbending and may be the rotation aligned bands built upon $(\nu_{11/2})^{-2}$ and $(\pi_{11/2})^2$ configurations, respectively. The nature of the bands was deduced from a comparison with a cranking model calculation. A negative parity band and the quasi-gamma band were identified. (14 refs.)

112110 Comment on 'determination of gamma-ray energies and abundances of ^{229}Th '. J.K.Dickens (Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1404-6 (Sept. 1983).
It is shown that the absolute normalization of γ -ray yields (I_γ) for transitions among levels in ^{229}Ra following α decay of ^{229}Th reported by Rattan et al. (see *ibid.*, vol.27, p.327, 1983) should be increased by at least 22%. Disagreements of reported values of I_γ with those in a recent report are discussed but not resolved. (8 refs.)

112111 Electric monopole strengths in even-mass Ge and Se isotopes. A.Passoja, M.Vergnes, J.Kantele, M.Luontama (Dept. of Phys., Univ. of Jyväskylä, Jyväskylä, Finland). *Phys. Scr. (Sweden)*, vol.T5, p.147-8 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Branching ratios of E0 and E2 transitions depopulating excited O_2^+ states in $^{70,74}Ge$ and $^{74,76}Se$ have been measured using conversion-electron and gamma-ray spectroscopy, and new half-life measurement techniques. The E0/E2 branching ratios and the life-times of the O_2^+ states are used to extract the $B(E2;O_2^+ \rightarrow 2_1^+)$ and $\rho^2(O_2^+ \rightarrow 0_1^+)$ values. (9 refs.)

112112 Electromagnetic transitions in ^{130}Ce . P.J.Nolan, R.Aryaeinejad, D.J.G.Love, A.H.Nelson, P.J.Smith, D.M.Todd, P.J.Twin (Oliver Lodge Lab., Univ. of Liverpool, Liverpool, England), J.D.Garrett, G.B.Hagemann, B.Herskind. *Phys. Scr. (Sweden)*, vol.T5, p.153-6 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). States in ^{130}Ce have been studied using ^{16}O induced reactions on ^{117}Sn and ^{118}Sn targets. Mean lifetimes have been measured for the yrast states up to $J^\pi=22^+$ using both the Doppler shift attenuation and recoil distance methods. Magnetic dipole transition rates have been deduced from branching ratio measurements within a band based on an isomeric state at 2454 keV. Electric quadrupole transition rates have been determined from mean lifetime measurements for states in the yrast band up to $J^\pi=22^+$. Both sets of results show an unexpected behaviour. (7 refs.)

112113 First results on γ -ray spectroscopy in the second minimum of ^{238}U and ^{240}Pu . D.Habs, U.v.Helmolt, H.W.Heyng, R.Kroth, B.Kolb, D.Pelte, D.Schwalb, H.J.Specht (Physik. Inst., Univ. Heidelberg, Heidelberg, Germany), W.Hennerici, H.J.Hennrich, G.Himmele, R.Repnow, W.Wahl, R.S.Simon, R.Albrecht, V.Metag. *Phys. Scr. (Sweden)*, vol.T5, p.183-5 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). γ -transitions preceding the fission decay of the shape isomers in ^{238}U and ^{240}Pu have been measured with the Crystal Ball. Lines at 616 keV and 808 keV are observed in ^{238}U and ^{240}Pu , respectively, which are tentatively interpreted as deexcitations of the β -vibrational band in the second minimum. (6 refs.)

112114 Optical potentials and isoscalar transition rates from 104 MeV alpha-particle scattering by the $N=28$ isotopes ^{48}Ca , ^{50}Ti and ^{52}Cr . R.Pesl, H.J.Gils, H.Rebel, E.Friedman, J.Buschmann, H.Klewe-Nebenius, S.Zagorski (Inst. für Radiochem., Karlsruhe, Germany). *Z. Phys. A (Germany)*, vol.313, no.1-2, p.111-22 (1983). Precisely measured differential cross sections for elastic and inelastic scattering from 104 MeV alpha-particles by ^{48}Ca , ^{50}Ti and ^{52}Cr are reported. The analyses aim primarily at the determination of strength, radial shapes and deformation of the scattering potentials, looking for isotonic differences of $N=28$ isotones. The mean square radii of the (real) potentials are discussed in terms of mean square radius differences of the matter distributions. The isoscalar transition rates derived by coupled channel analyses of the measured cross sections are compared with electromagnetic rates. In addition to the analyses on the basis of a slightly generalized extended optical model a semi-microscopic deformed folding model has been applied, using a density-dependent effective alpha-bound nucleon interaction. Though an excellent description of the data over the full angular range is obtained the resulting values of the deformation parameters appear to be not consistent with results from various different methods. (33 refs.)

112115 Study of non-static behavior of $\tau\sigma$ -modes by (p,n) reactions. M.Ichimura (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan), T.Izumoto, C.M.Ko, P.J.Siemens. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.196-205. The nuclear response function of $\tau\sigma$ -modes are investigated in the wide range of the energy-momentum plane (ω, q). The opalescence phenomena associated with the pion condensation is clearly seen at $q \approx 2.2 \mu$ (μ being the pion mass) and rather low ω in the response function of the normal nuclear matter if the Migdal parameter $g \leq 0.5$. To investigate such behavior of the nuclear response to the $\tau\sigma$ -modes, the $^{90}Zr(p,n)$ reaction to the continuum states is analyzed by DWBA. The response functions of the finite nucleus are constructed by the local density approximation from those of the nuclear matter. It is found that the finiteness and the distorted wave effects smear the enhancement (the opalescence phenomena) considerably, but it would still be seen if $q \leq 0.4$. (17 refs.)

112116 Gamow-Teller and magnetic dipole transitions in nuclei. A.Arima (Dept. of Phys., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.223-40. Several mechanisms for the quenching of Gamow-Teller and magnetic dipole transitions are discussed. It is pointed out that, contrary to common belief, the tensor correlation is much more important than the effect of Δ -hole states. The best evidence for this fact is the quenching of the expectation value of spin for which the Δ -hole states do not have any first order corrections at all. (16 refs.)

112117 Proton-carbon bremsstrahlung cross sections and nuclear time-delays near the $^{12}C(p,p)$ resonances. T.Suzuki, M.Adachi, T.Kohno, A.Makishima, N.Yamada, H.Taketani (Dept. of Appl. Phys., Tokyo Inst. of Technol., Tokyo, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.888-95. Bremsstrahlung spectra in coincidence with scattered protons have been measured at four incident proton energies near the $^{12}C(p,p)$ resonances at $E_{p,lab}=1.734$ MeV($5/2^+$), 1.686 MeV($3/2^-$) and 0.461 MeV($1/2^+$). By simultaneously measuring the bremsstrahlung spectra for protons scattered at $\theta_{cm}=90^\circ$ and at the desired angle ($\theta_{cm}=159^\circ$ or 146°), the authors have obtained reliable values for the phase difference and the time delay as well as for the absolute bremsstrahlung cross section. In particular, data of good quality have been obtained at an incident proton energy of 1.783 MeV for which a quantitative comparison with the Feshbach-Yennie theory has become possible for the first time. (12 refs.)

23.20C Lifetimes and transition probabilities

112118 The application of lineshape analysis in plunger measurements. G.Winter (Zentralinst. für Kernforschung Rossendorf, Dresden, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.537-9 (1 Sept. 1983). The evaluation of lifetimes of nuclear states from plunger measurements by means of lineshape analysis is described. The role of detailed stopping calculations (Monte Carlo method) is illustrated. (9 refs.)

112119 A program for calculation of the E1, E2 and M1 transition probabilities in odd-odd nuclei taking the Coriolis mixing into account. Z.Hons (Lab. of Nuclear Problems, JINR, Dubna, USSR), J.Kvasil. *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.59-69 (July-Aug. 1983). It is well known that comparison of experimental reduced transition probabilities with their model-dependent predictions is of great importance for studying nuclear structure. Namely, the influence of the Coriolis particle-rotational coupling on electromagnetic transitions between excited states in odd-A deformed nuclei has been the subject of interest in many papers and has been reliably demonstrated. The analogous situations in odd-odd nuclei has also been established. The program makes it possible to calculate the E1, E2 and M1 reduced transition probabilities in odd-odd deformed nuclei. The mixed wave functions used result from a least-squares fit of energy levels (taking the Coriolis effect into account) to the experimental ones, performed with the modified ODDODDCORI subprogram [2]. (4 refs.)

112120 Lifetimes in ^{18}F . R.Moro, A.Brondi, A.D'Onofrio, V.Roca, M.Romano, F.Terrasi (Istituto di Fisica Sperimentale, Univ. di Napoli, Napoli, Italy), B.Delaunay, H.Dumont. *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.1, p.7-10 (3 Sept. 1983). The lifetimes of nine levels in ^{18}F have been measured by using the DSAM and the $^3He(^{16}O,p)^{18}F$ inverse reaction at 21 MeV incident energy on Al backings. Particle-gamma coincidence was employed. Levels (MeV) and corresponding lifetime (ps) deduced by a line shape analysis are as follows: 1.70 (0.897 ± 0.057), 2.10 (4.93 ± 0.78), 2.52 (0.554 ± 0.045), 3.06 (< 0.004), 3.13 (0.343 ± 0.022), 3.36 (0.451 ± 0.034), 3.72 (< 0.007), 3.79 (1.90 ± 0.20) and 3.84 (0.021 ± 0.004). 23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

- 112121 The internal bremsstrahlung (IB) from the allowed beta-emitters. S.El-Konsol, A.M.Basha, S.A.Gaafar, A.A.El-Sayed, A.S.Yousef (Reactor & Neutron Phys. Dept., Atomic Energy Establ., Cairo, Egypt). *Atomkernenergie, Kerntechnik*, (Germany), vol.42, no.2, p.120-3 (1983). The IB spectrum of a complex source consisting of ^{35}S , ^{32}P and ^{32}P was measured in the energy range 80-1700 keV. A NaI(Tl) crystal spectrometer was used. A new approach was tried to decompose the IB spectrum into its three components. The resulting IB spectra were analyzed adopting the variable width peeling off method. The experimental IB probability is compared with the KUB, Nilsson and Lewis-Ford theories. A quite good agreement has been obtained. (27 refs.)
- 112122 The decay of ^{75}Se . K.Singh, R.Mittal, M.L.Hasiza, H.S.Sahota (Dept. of Phys., Punjabi Univ., Patiala, India). *Indian J. Phys. Part A*, vol.57A, no.3, p.127-34 (May 1983). Energy and intensity measurements for X-ray and gamma transitions in the decay of ^{75}Se have been made using Si (Li) and intrinsic Ge detectors below 300 keV. The measurements confirm the presence of 14.9, 24.4 and 80.8 keV transitions. Internal conversion analysis for the 66 keV transition yields $\delta_{66} = 0.0070 \pm 0.0005$ and $\lambda = 11.25 \pm 0.25$. From directional correlation measurements on the 136-66 keV cascade, the 136 keV transition is assigned as $E_1 + (0.15 \pm 0.10)\%$ M2. The influence of after-effects due to electron capture on the 121-279 keV cascade has been studied with different concentrations of the liquid surroundings of the active nuclei. Attenuation of the directional correlation coefficient has been observed. (13 refs.)
- 112123 Atomic effects on the tritium ft value. B.Budick (Phys. Dept., New York Univ., New York, NY, USA). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1034-7 (19 Sept. 1983). Atomic effects on the tritium ft value including bound-state decay, imperfect wave-function overlap, screening, and electron exchange are considered for each of the species T^+ , T , T_2 , and T^- . Corrections to the f value are tabulated and can be combined to extract an improved estimate for the axial-vector matrix element in tritium β decay. (21 refs.)
- 112124 Search for mixing of heavy neutrinos in the β^+ and β^- spectra of the ^{64}Cu decay. K.Schreckenbach, G.Colvin (Inst. Laue-Langevin, Grenoble, France), F.von Feilitzsch. *Phys. Lett. B (Netherlands)*, vol.129B, no.3-4, p.265-8 (22 Sept. 1983). The β^+ and β^- spectral shape of the ^{64}Cu decay were analysed for admixtures of heavy neutrinos in the mass range 30 keV 460 keV. The resulting upper limits for the mixing angle $\sin^2\theta$ were determined, achieving a minimum limit of 3.5×10^{-3} at a neutrino mass of 350 keV. (9 refs.)
- 112125 Branching ratio in the decay of ^7Be . G.J.Mathews, R.C.Haight, R.G.Lanier, R.M.White (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *Phys. Rev. C (USA)*, vol.28, no.2, p.879-84 (Aug. 1983). The branching ratio for ^7Be electron-capture decay to the first excited state in ^7Li has been measured by implanting a 20-MeV ^7Be beam into a silicon detector telescope and counting the subsequent γ decays with well calibrated Ge(Li) detectors. A branching ratio of $10.7 \pm 0.2\%$ was obtained. This value is in agreement with past measurements but does not agree with a recently suggested higher value. Sources of uncertainties and implications for nuclear physics and astrophysics are discussed. (26 refs.)
- 112126 Branching ratio in the electron-capture decay of ^7Be . C.N.Davids, A.J.Elwyn, B.W.Filippone, S.B.Kaufman, K.E.Rehm, J.P.Schiffer (Argonne Nat. Lab., Argonne, IL, USA). *Phys. Rev. C (USA)*, vol.28, no.2, p.885-7 (Aug. 1983). The branching ratio for the electron-capture decay of ^7Be to the 478 keV state in ^7Li has been measured. ^7Be nuclei recoiling near zero degrees from the $^1\text{H}(^7\text{Li}, ^7\text{Be})n$ reaction were counted by and implanted into a Si detector placed in the focal plane of an Enge split-pole spectrograph. After determining the total number of implanted ^7Be nuclei from the pulse height spectrum, the absolute number of 478 keV γ rays was measured with a Ge(Li) detector. The resulting branching ratio of $10.61 \pm 0.23\%$ agrees well with previous measurements. (6 refs.)
- 112127 Predicted features of the beta decay of neutron-rich sd -shell nuclei. B.H.Wildenthal, M.S.Curtin, B.A.Brown (Dept. of Phys. & Astron., Michigan State Univ., East Lansing, MI, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1343-66 (Sept. 1983). The Gamow-Teller beta-decay transitions of sd -shell nuclei with five or more excess neutrons are calculated from complete $(0d_{5/2}, 1s_{1/2}, 0d_{3/2})$ -space shell-model wave functions. These wave functions are obtained from diagonalizations of a model Hamiltonian formulation which reproduces observed energy-level structures throughout the sd shell. The calculations are carried out with both the 'free-nucleon' normalization for the Gamow-Teller single-nucleon matrix elements and one based on the empirical values obtained for these quantities from a comparison of corresponding theoretical and experimental Gamow-Teller magnitudes near the line of stability. The

phase-space factors f which connect the reduced Gamow-Teller strength to the total half-lives and the individual decay probabilities are calculated both from the energies obtained in the shell-model calculations and, alternatively, from hybrid energy spectra in which available experimental energies are substituted for the corresponding calculated values wherever possible. Comparisons of the beta-decay predictions to existing experimental results are presented and discussed. (41 refs.)

112128 Gamow-Teller strength function for ^{90}Zr : effects of spin and isospin exchange forces, and ground-state correlations. G.J.Mathews, S.D.Bloom (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), R.F.Hausman, Jr. *Phys. Rev. C (USA)*, vol.28, no.3, p.1367-73 (Sept. 1983). Shell-model calculations of the Gamow-Teller strength function for ^{90}Zr have been performed utilizing a realistic finite-range two-body interaction in a model space consisting of the $2p$ and $1g$ shells. The effects of admixtures of two-particle two-hole excitations in ^{90}Nb , mostly due to the spin and isospin exchange components of the nucleon-nucleon force, are discussed. Ground state correlations in ^{90}Zr are also added via seniority-zero two-proton excitations from the $2p$ shell into the $1g_{9/2}$ shell. With the correlations the Gamow-Teller strength function is in good agreement with the experimental results and accounts for essentially all of the observed dispersion of strength. The inclusion of these correlations does not, however, produce either a displacement of Gamow-Teller strength to higher excitation energies, or a significant change in the total strength. Thus, they cannot account for the observed Gamow-Teller quenching. The quenching factor derived by a comparison of the calculated results with experiment is 0.52. (18 refs.)

112129 Identification of ^{233}Ac . Y.Y.Chu, M.L.Zhou (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1379-81 (Sept. 1983). The authors report in this paper identification of the new isotope ^{233}Ac . Uranium targets were irradiated with 28 GeV protons; after rapid retrieval of the target and separation of actinium from thorium, ^{233}Ac was allowed to decay into the known ^{233}Th daughter. Exhaustive chemical purification was employed to permit the identification of ^{233}Th via its characteristic γ radiations. The half-life derived for ^{233}Ac from several experiments is 2.3 ± 0.3 min. The production cross section for ^{233}Ac is 100 μb . (12 refs.)

112130 Extensions of the theory of electromagnetically induced nuclear beta decay. H.R.Reiss (Arizona Res. Labs., Univ. of Arizona, Tucson, AZ, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1402-3 (Sept. 1983). The theory of nuclear beta decays induced by intense electromagnetic fields as previously presented is applied to a much broader range of physical variables. The most important intensity domain is found to occur at lower values than had previously been estimated. Furthermore, electromagnetic field 'retardation terms', previously pointed out as potentially important but unevaluated, are found to be significant contributors to the overall transition probability. A treatment of the entire problem in 'electric field' gauge, instead of the original Coulomb gauge, gives identical results. (5 refs.)

112131 Studies of weak beta-delayed protons emitted in the decay of odd- Z , $T_z = -3/2$ nuclei. J.Aysto, P.Taskinen (Dept. of Phys., Univ. of Jyväskylä, Jyväskylä, Finland), K.Eskola, K.Vierinen, S.Messelt. *Phys. Scr. (Sweden)*, vol.T5, p.193-5 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Radioactive decay of $T_z = -3/2$ nuclides, ^{27}P and ^{31}Cl , predicted to be weak β -delayed proton precursors, have been looked for. Two proton groups having energies of 989 ± 15 and 1528 ± 20 keV and a half-life of 150 ± 25 ms were associated with the decay of ^{31}Cl . The search for ^{27}P is still under way, but the first qualitative results are briefly discussed.

112132 A note on the Gamow-Teller sum rule with non-nucleonic degrees of freedom. J.A.Niskanen (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland). *Phys. Scr. (Sweden)*, vol.T5, p.196-8 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Derives a sum rule for the Gamow-Teller transition strength allowing for internal excitations of nucleons. The effect of the $\Delta(1236)$ isobar in the final state is to reduce the total strength to 36% of the purely nucleonic value. However, separately the strengths for opposite charge changes are both enhanced. The author also discusses the effect of Δ admixtures in the initial state and find the change in the sum rule to be very small. (6 refs.)

23.60 ALPHA DECAY

112133 Identification of ^{222}U and ^{221}Pa by α -correlation chains. R.Hingmann, H.-G.Clerc, C.-C.Sahm, D.Vermeulen (Inst. für Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), K.-H.Schmidt, J.G.Keller. *Z. Phys. A (Germany)*, vol.313, no.1-2, p.141-2 (1983). In the course of fusion studies it was possible to identify the new isotopes ^{222}U ($T_{1/2} = 1 \mu\text{s}$) and ^{221}Pa ($T_{1/2} = 6.1 \mu\text{s}$) via α -decay chains. The measurement may serve as an example for the possibility of observing extremely shortlived evaporation residues with the help of the velocity filter SHIP. (7 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

112134 On direct mechanism of light-particle emission in incomplete-fusion reactions. C.V.Christov, I.I.Delchev, I.J.Petkov (Inst. of Nuclear Res. & Nuclear Energy, Bulgarian Acad. of Sci., Sofia, Bulgaria). *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.284-9 (1983). The light-particle emission in incomplete-fusion reactions is analyzed within the framework of a theoretical model based on a direct-reaction mechanism. In the model a more sophisticated version of complete-fusion theory is

employed. The theoretical results are in good agreement with experimental data. (16 refs.)

112135 Counting the peaks in the excitation function for precompound processes. R.Bonetti (Inst. de Fisica Generale Applicata, Univ. di Milano, Milano, Italy), M.S.Hussein, P.A.Mello. *Phys. Rev. C (USA)*, vol.28, no.2, p.923-5 (Aug. 1983).

The 'counting of maxima' method of Brink and Stephen, conventionally used for the extraction of the correlation width of statistical (compound nucleus) reactions, is generalized to include precompound processes as well. It is found that this method supplies an important independent check of the results obtained from autocorrelation studies. An application is made to the reaction $^{25}\text{Mg}(^3\text{He}, p)$. (11 refs.)

112136 Dynamics of damped nuclear reactions. J.Randrup (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Phys. Scr. (Sweden)*, vol.T5, p.98-102 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The nucleon-exchange model for damped nuclear reactions is briefly reviewed in the framework of macroscopic transport theory. Recent developments are discussed and some future directions indicated. (9 refs.)

112137 Generalized Ramsauer effect in multistep reaction process. M.Nomura (Inst. of Phys., Univ. of Tokyo, Tokyo, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.517-21

Comparative study of a set of one-step-allowed reactions is discussed as a means to observation, with less ambiguity, of nonresonant interference inherent to multistep process. The discussion relies closely on nuclear structure of final states. Intuitive image of Ramsauer effect is utilized. (9 refs.)

112138 Reaction mechanism models embedded in the exact scattering theory. V.Vanzani (Istituto di Fisica, Univ. di Padova, Padova, Italy). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.522-6

Proves that, when the reaction dynamics is dominated by a limited number of cluster and/or channels, the exact multiparticle scattering theory, even in its most sophisticated chain-of-partitions labelled form, can be reduced to much more manageable proportions. The author considers the reductions which take place when a set of two-cluster partitions is physically important and when three clusters play a dominant role. (3 refs.)

112139 Molecular states for the transfer reactions (a new three-body equation). A.V.Matveenko (JINR, Dubna, USSR).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.906-13

The author considers the transfer reaction $(a+c)+b \rightarrow (b+c)+a$. A molecular representation of the asymptotic states is derived, and a new molecular Hamiltonian presented. (5 refs.)

24.10H Optical and diffraction models

112140 The inverse mean field method and the energy dependence of the nuclear potential. E.F.Hefter, K.A.Gridnev (Inst. de Fisica, Univ. Nacional Autonoma de Mexico, Mexico City, Mexico).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.813-20 (Aug. 1983).

The foundations of the inverse mean field method (Imefim) and its relation to traditional approaches are discussed. Imefim predicts the energy dependence of the real central (nuclear) part of the optical model potential to have the functional form $(1+eE_p)^{-3}$. Treating for the time being the constant e as an adjustable parameter, this prediction is shown to compare nicely with well-established formal and heuristic results. (25 refs.)

112141 Relativistic nuclear optical models. L.S.Celenza, C.M.Shakin (Dept. of Phys., Brooklyn Coll., City Univ. of New York, New York, NY, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1256-63 (Sept. 1983).

Recently it has been shown that the use of a relativistic impulse approximation allows one to calculate a nucleon optical potential for use in the Dirac equation. Excellent fits have been obtained for differential cross sections and spin-dependent observables for energies greater than 400 MeV. In this work the authors provide a general description of the form of the momentum-space optical potential for use in the Dirac equation. It is shown that there are eight invariant functions that determine the potential. Procedures for calculating these functions are given. (In the case of nuclear matter only three of these functions are required to specify the nucleon self-energy). (21 refs.)

112142 Radiative capture in the inelastic channel of the compound nucleus. Liu Jian-feng, Ho Yu-kun (Phys. Dept., Zhengzhou Univ., China). *Phys. Energ. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.355-60 (May 1983). In Chinese.

The radiative capture in the inelastic channel of the compound nucleus is discussed. Starting from the S-matrix theory, the calculation formula for this situation is derived. Then connected with the optical model and Hauser-Feshbach's statistical theory with the width fluctuation correction, a formula convenient for calculations is given. (9 refs.)

112143 The imaginary part of the nucleon-nucleus optical potential. S.Bhattacharya (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Calcutta, India), S.Kailas.

Z. Phys. A (Germany), vol.313, no.1-2, p.99-103 (1983).

Volume integrals of the imaginary part of the proton and the neutron optical potentials obtained from the existing phenomenological analyses for the mass number range of 12-209 and for a range of nucleon energies ($E_p=10$ -180 MeV, $E_n=8$ -150 MeV) have been fitted with an empirical expression. The isoscalar, the isovector and the Coulomb components determined empirically have been compared with those obtained from the microscopic approach. Though there is qualitative agreement between the two predictions, there are differences when compared quantitatively. (19 refs.)

112144 The nucleon optical potential at intermediate energies: new phenomenology and its microscopic basis. P.Schwandt (Cyclotron Facility, Indiana Univ., Bloomington, IN, USA).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.3-33

The validity and failure of conventional optical model phenomenology for the description of proton elastic scattering at intermediate energies is reviewed. The question of unorthodox (non-Woods-Saxon) shapes for the real central potential is discussed from phenomenological as well as microscopic points of view. Results of alternative, microscopically-based optical-model phenomenologies are presented, and the consequences of employing unorthodox optical potentials in distorted-wave calculations of reactions are explored. (37 refs.)

112145 Microscopic relativistic treatment of nucleon-nucleus scattering. J.R.Shepard (Nuclear Phys. Lab., Univ. of Colorado, Boulder, CO, USA). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.34-46.
The form of the Dirac impulse approximation optical potential is presented. This potential is used to calculate proton-nucleus elastic scattering and, at energies above ~ 500 MeV, the results are in excellent agreement with data and vastly superior to the Schroedinger-based impulse approximation, especially for the spin observables. Since the inputs for the Dirac and Schroedinger approaches are nearly identical, the differences between the two methods can be explored in detail. The extension of this approach to a microscopic treatment of proton-nucleus inelastic scattering is also discussed. (22 refs.)

112146 Volume integrals of optical potentials for composite projectiles. M.Matoba (Graduate School of Engng. Sci., Kyushu Univ., Kasuga, Japan), M.Hyakutake, I.Kumabe.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.47-52.
Volume integrals of central optical potentials for scatterings of deuterons, ^3He and α -particles from nuclei are discussed. The correction factors of volume integrals of ^3He real central optical potentials to those estimated from nucleon-nucleus folded potentials are about 30% at the incident energy of 10–30 MeV/nucleon and approach to negligibly small values at 70–100 MeV/nucleon region. Volume integrals of imaginary central potentials are also discussed. (19 refs.)

112147 Microscopic optical potentials derived from free NN potentials. H.V.von Geramb, L.Rikus, K.Nakano (Theoretische Kernphys., Univ. Hamburg, Hamburg, Germany).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.78-109.
First principle optical potentials are studied with the nuclear matter approach, which is based on Brueckner's development of the many-body problem (1955) and the hole-line expansion of Hufner and Mahaux (1972). This contribution concentrates on the most recent developments in calculations of the Bethe-Goldstone reaction matrix with free NN potentials as input. As an important intermediate result the authors give a comprehensive discussion of the effective energy and density dependent interaction with an outline of the limitations so far detected. The nonrelativistic nucleon-nucleus optical potential for energies below 400 MeV is formulated as a lowest order folding model result including proper treatment of knock-on exchange effects. A status report on the microscopic optical potential is given via its application to various case studies. (22 refs.)

24.30 RESONANCE REACTIONS AND SCATTERING

112148 ^{17}O - ^{17}N analog states via the $^{14}\text{C}(^6\text{Li},t)$ and $^{14}\text{C}(^6\text{Li}, ^3\text{He})$ reactions. A.Cunsolo, A.Foti, G.Imme, G.Pappalardo, G.Raciti (Istituto Nazionale di Fisica Nucleare, Catania, Italy), N.Saunier.
Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.3, p.87-92 (17 Sept. 1983).
The reactions $^{14}\text{C}(^6\text{Li},t)^{17}\text{O}$ and $^{14}\text{C}(^6\text{Li},^3\text{He})^{17}\text{N}$ are investigated at $E(^6\text{Li})=34$ MeV. Energy spectra and angular distributions of tritons and ^3He -particles are measured and spectroscopic factors are obtained through a HF and EFR-DWBA analysis of the data. The $T=3/2$ analog pairs in the ^{17}O - ^{17}N nuclei are identified from the comparison of these data. (8 refs.)

112149 Excitation of the isoscalar giant quadrupole resonance in $^{118}\text{Sn}(\pi^{\pm}, \pi^{\pm})$. J.L.Ullmann, J.J.Kraushaar, T.G.Masterson, R.J.Peterson, R.S.Raymond, R.A.Ristinen (Univ. of Colorado, Boulder, CO, USA), N.S.P.King, R.L.Boudrie, C.L.Morris, W.W.True, R.E.Anderson, E.R.Siciliano.
Phys. Rev. Lett. (USA), vol.51, no.12, p.1038-41 (19 Sept. 1983).
The isoscalar giant quadrupole resonance is studied in $^{118}\text{Sn}(\pi^{\pm}, \pi^{\pm})$ at 130 MeV. It is found that the ratio of π^{-} to π^{+} cross sections at their maximum is 1.9 and that 57% of the energy-weighted sum rule is exhausted in π^{-} scattering. This large ratio of π^{-} to π^{+} cross sections is not anticipated by conventional models, and may be interpreted as evidence for substantial isovector strength. (17 refs.)

112150 Landau damping in the degenerate Fermi liquid. T.Yukawa, H.Kurasawa (KEK, Ibaraki, Japan).
Phys. Lett. B (Netherlands), vol.129B, no.3-4, p.162-6 (22 Sept. 1983).
The authors study the dispersion law of sound propagation in the degenerate Fermi liquid. In contrast with the Landau theory at zero temperature they find the damped oscillation mode (Landau damping) due to quantum effects. The relation between the frequency and the width of this mode has a similar character as found in giant resonances. (8 refs.)

112151 Charged pion electroproduction, a selective probe of nuclear spin-isospin responses. G.Chanfray, J.Delorme (Inst. de Phys. Nucleaire de Lyon, Univ. Claude Bernard, Villeurbanne, France).
Phys. Lett. B (Netherlands), vol.129B, no.3-4, p.167-71 (22 Sept. 1983).
The authors study the reaction of pion electroproduction on nuclei in the quasi-elastic region. They show that detection of the pion in the direction of the virtual photon permits the separation of the longitudinal and transverse spin responses through a Rosenbluth plot. Emphasis is also put on consistency between medium effects and gauge invariance. (10 refs.)

112152 Giant resonance splitting in deformed nuclei. M.Di Nardo, M.Di Toro, G.Giansiracusa, U.Lombardo, G.Russo (Istituto di Fisica, Univ. di Catania, Sezione di Catania, Catania, Italy).
Phys. Rev. C (USA), vol.28, no.2, p.929-32 (Aug. 1983).
The authors describe the giant resonances as simple scaling solutions of a linearized Vlasov equation obtained from a time-dependent Hartree-Fock theory in phase space. For ellipsoidal deformed nuclei they get a splitting of the isoscalar giant quadrupole resonance proportional to the ground state charge quadrupole moment. The lower energy state ($\hbar\omega_{\parallel}$ for prolate nuclei, $\hbar\omega_{\perp}$ for oblate) always gets the larger electromagnetic strength. (18 refs.)

112153 Observation of $2\hbar\omega$ hexadecapole strength in lead nuclei from 200 MeV inelastic proton scattering. J.R.Tinsley, D.K.McDaniels, J.Lisanti, L.W.Swensen, R.Liljestrang, D.M.Drake (Univ. of Oregon, Eugene, OR, USA), F.E.Bertrand, E.E.Gross, D.J.Horen, T.P.Sjoreen.
Phys. Rev. C (USA), vol.28, no.3, p.1417-20 (Sept. 1983).
Excitation of strength packed at 12.0 MeV is observed in ^{208}Pb and ^{206}Pb via the inelastic scattering of 200 MeV protons. Based upon angular distribution measurements in ^{208}Pb the authors interpret the strength as an isoscalar $2\hbar\omega$, $L=4$, excitation. (16 refs.)

112154 Gamow-Teller resonances. C.Gaarde (Niels Bohr Inst., Roskilde, Denmark).
Phys. Scr. (Sweden), vol.T5, p.55-62 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
Data from recent (p,n) and ($^3\text{H},t$) experiments at intermediate energies are presented. The reactions show a spectacular selectivity for excitation of isospin-spin models in nuclei. From the zero degree (p, n) spectra Gamow-Teller strength can be deduced, and only half the sum rule strength is observed. The very general nature of the sum rule for charge exchange modes suggests that internal degrees of freedom of the nucleon could be involved. The ($^3\text{He}, t$) reaction at 2 GeV shows a strong excitation of the Δ -resonance, indicating that this resonance could be important for the isospin-spin excitations in nuclei. (21 refs.)

112155 Inelastic electron scattering, fine structure of M1 giant resonances and Gamow-Teller states. A.Richter (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany).
Phys. Scr. (Sweden), vol.T5, p.63-73 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
Recent progress in obtaining detailed fine structure distributions of magnetic giant resonances in nuclei using high resolution inelastic electron scattering at low energy is discussed. The author considers $^{40,42,44,48}\text{Ca}$ in which M1 excitations are due to neutron spin-flip transitions, and the N-28 isotones ^{50}Ti , ^{52}Cr and ^{54}Fe where in addition proton excitations contribute to the measured M1 strength. It is found that the M1 strength is very fragmented and considerably quenched in comparison to predictions of shell model calculations. It is shown for two specific examples of M1 transitions in ^{48}Ca and ^{88}Sr that the $\Delta(1232)$ -hole model accounts for part of this quenching. The virtual Δ -isobar admixture in 1^{+} spin-isospin excitations in complex nuclei is estimated. Furthermore, the results from inelastic electron scattering are compared to (p,n) charge exchange reactions exciting Gamow-Teller states and to recent high resolution (p,p') results. Finally, the M1 strength in ^{208}Pb is studied and the results of a form factor measurement of a recently discovered low lying $J^{\pi}=1^{+}$ state are presented. (40 refs.)

112156 High spin resonances in heavy ion collisions. R.R.Betts, S.Saini (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Scr. (Sweden), vol.T5, p.204-6 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982).
Excitation functions for elastic scattering and reactions of $^{28}\text{Si}+^{28}\text{Si}$ show evidence for the existence of narrow ($\Gamma=100$ -200 keV) high-spin ($J\approx 40$ \hbar) resonances. The interpretation of these resonances as high-spin fissioning shape isomers is discussed with reference to data for the $^{28}\text{Si}+^{30}\text{Si}$ and $^{30}\text{Si}+^{30}\text{Si}$ systems. (10 refs.)

112157 Statistical properties of $3/2^{-}$ resonances in ^{45}Sc and ^{51}Mn . J.F.Shirner, Jr., K.M.Whatley, E.G.Bilpuch, C.R.Westerfeldt (Duke Univ., Durham, NC, USA), G.E.Mitchell.
Z. Phys. A (Germany), vol.313, no.1-2, p.51-6 (1983).
Magnitudes and relative signs of reduced width amplitudes for two inelastic decay channels were obtained for $3/2^{-}$ resonances in ^{45}Sc and ^{51}Mn . Width and amplitude correlations were determined, and the first large amplitude correlation has been observed for $l=1$ resonances over a broad range. These results are consistent with the large amplitude correlations previously observed for $3/2^{+}$ and $5/2^{+}$ resonances. (24 refs.)

112158 Excitation of M1 resonances by medium energy protons. G.M.Crawley (Inst. de Phys. Nucleaire, Orsay, France), C.Djalali, N.Marty, M.Morlet, A.Willis, J.C.Jourdain, N.Anantaraman, A.Galonsky, J.Duffy.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.153-75.
The results of 201 MeV (p,p') studies of $\Delta L=0$ spin-flip transitions at very forward angles are discussed. The reasons for making comparisons between (p,p'), (p,n) and electromagnetic measurements of M1 transitions are outlined. After presenting some of the experimental and theoretical uncertainties, a summary of the results on the Zr isotopes plus other nuclei to mass 140 is given. Results from ^{48}Ca , the N=28 nuclei ^{50}Ti , ^{51}V , ^{52}Cr and ^{54}Fe are discussed and compared with (p,n) and electromagnetic measurements. In the Ni isotopes, the T_0 and T_0+1 components of the 1^{+} spin-flip transition were observed both in (p,p') and in (p,n) reactions. (48 refs.)

112159 The giant isovector E2 resonance in calcium observed in radiative neutron capture. I. Bergqvist, A. Hakansson, A. Lika, A. Lindholm, L. Nilsson, N. Olsson, R. Zorro (Tandem Accelerator Lab., Univ. of Uppsala, Uppsala, Sweden).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.861-9

The reaction $^{40}\text{Ca}(n,\gamma)^{41}\text{Ca}$ has been studied in the neutron energy range 20-28 MeV, where the isovector giant quadrupole resonance may be localized. It is expected that interference between E1 and E2 radiation will give rise to a fore-aft asymmetry of the emitted γ rays. This is also observed. The results are compared with calculations based on the direct-semidirect capture model. Good agreement with the experimental data is obtained assuming an isovector E2 resonance located at 32 MeV with a strength exhausting about 35% of the isovector E2 sum rule. This corresponds to the full strength of the T_{-} component. (18 refs.)

112160 Nonequilibrium decay process of giant resonances studied by gamma transitions. M. Tanaka (Kobe Tokiwa Jr. Coll., Kobe, Japan), K. Iwamoto, T. Yamagata, K. Yuasa, S. Nakayama, T. Fukuda, T. Shimoda, K. Okada, M. Wakai, M. Inoue, H. Ogata.

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.877-87

Gamma-decay of the low-energy octupole resonance (LEOR) in ^{90}Zr and ^{58}Ni was studied by inelastic α scattering at 99.3 MeV and 110 MeV, respectively. Correlation functions measured for the ground state transition support a sign 3 assignment for the LEOR. Observed branching ratios to the ground and the low-lying states around $E_x \sim 2.2$ MeV for ^{90}Zr are respectively $(7.9 \pm 1.0)\%$ and $(32 \pm 10)\%$, which are significantly larger than those predicted by the statistical-decay model and the latter enhanced branching ratio suggests the coupling of the giant resonances to the nuclear surface vibration. Observed branching ratios to the ground and the 2_1^+ state for ^{58}Ni , on the other hand, were $\sim 1\%$ and $\sim 7\%$, respectively, which were roughly in agreement with the statistical decay model. (27 refs.)

24.50 DIRECT REACTIONS

112161 Assessment of the Feshbach-Kerman-Koonin approximations in multistep direct reaction theories. T. Udagawa, K.S. Low, T. Tamura (Dept. of Phys., Univ. of Texas, Austin, TX, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1033-9 (Sept. 1983).

The approximations made in the statistical multistep direct reaction theory of Feshbach, Kerman, and Koonin (1980) are examined. It is shown that these approximations individually produce rather large errors and that, although they sometimes cancel out partially, a significant amount of net error remains in general. (6 refs.)

112162 Fragmentation of light ions at relativistic energies. S. Garpman, G. Claesson, I. Lund, I. Otterlund (Div. of Cosmic & Subatomic Phys., Univ. of Lund, Lund, Sweden).

Phys. Scr. (Sweden), vol.T5, p.217-21 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglo, Denmark, 16-20 Aug. 1982).

Some simple reaction mechanisms for fragmentation of nuclei at relativistic energies are discussed. The inclusive spectra of fragments in longitudinal and transverse momenta give valuable information about the momentum distribution of a nucleon inside the fragmenting nuclei as well as effects of the nuclear mean field. The authors also report on preliminary results from the experiment R418 at the CERN ISR, where $p\alpha$ and $\alpha\alpha$ reactions were studied at CM energies: $\sqrt{s} \approx 88$ and 125 GeV respectively. By examining two-particle correlations they can study the process of simple fragmentation and the so called hard-scattering process. (18 refs.)

112163 Post-form DWBA description of coincidence spectra in light ion induced break-up reactions. R. Shyam (GSI, Darmstadt, Germany), G. Baur, F. Rosel, D. Trautmann.

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.541-57

Some of the recently measured angular correlations between outgoing fragments on the break-up reactions induced by the light projectiles (like deuteron, ^3He and α -particle) have been analysed in terms of a break-up theory developed in the framework of the post-form DWBA. It is shown that this theory provides a good description of the experimental data over a wide range of the bombarding energies and the target nuclei. In some cases the results of the present calculations have been compared with those performed with a different theoretical model, and the results are discussed. (29 refs.)

24.60 STATISTICAL THEORY AND FLUCTUATIONS

112164 Two body residual interaction in the statistical multistep compound and direct theories. R. Bonetti, L. Colombo (Istituto di Fisica Generale Appl., Univ. di Milano, Milano, Italy).

Phys. Rev. C (USA), vol.28, no.3, p.980-2 (Sept. 1983).

It is shown that within the multistep compound theory the use of matrix elements calculated with a density dependent two-body residual interaction of the Yukawa form makes possible reproduction of the experimental data of multistep compound reactions with an interaction strength V_0 which turns out to be consistent with the one used in the analysis of multistep direct processes. (19 refs.)

112165 Random-walk model of precompound decay. II. Stochastic uncertainties in the lifetimes and cross-sections. J.M. Akkermans (Netherlands Energy Res. Foundation ECN, Petten, Netherlands).

Z. Phys. A (Germany), vol.313, no.1-2, p.83-92 (1983).

For pt.I see *ibid.*, vol.300, p.345 (1981). The uncertainties arising from the stochastic nature of precompound decay nuclear reactions are analyzed in the framework of the preequilibrium exciton and random-walk models. It is demonstrated that the standard deviations and the mean values of the exciton-state lifetimes are of the same order of magnitude. Their correlations are weakly positive, except for exciton states near the equilibrium number, where the correlations are significant. The usefulness and the limitations of the never-come-back approximation are discussed. A general proof is presented of the conditions under which the master-equation and random-walk approaches to Markov processes are equivalent. Connections between different preequilibrium models, e.g. the multi-step compound model and the microscopic statistical theory of precompound decay, are pointed out. It is shown that the waiting time between subsequent collisions is governed by a Poisson process, suggesting that the variance associated with the nucleon mean free path in nuclear matter, as estimated from preequilibrium models, is considerable. The stochastic uncertainties in the emission cross-sections correspond to those of a Bernoulli process. (14 refs.)

112166 Angular distributions in pre-equilibrium reactions. A. Chatterjee (Nuclear Phys. Div., Bhabha Atomic Res. Centre, Bombay, India), S.K. Gupta.

Z. Phys. A (Germany), vol.313, no.1-2, p.93-8 (1983).

A new model is proposed for calculating angular distributions in preequilibrium reactions. In this model, as in the model of Feshbach et al. (1979) the system consisting of target plus projectile initially branches into two sets of states with either no particle in the continuum (multistep compound states) or with at least one particle in the continuum (multistep direct states). The multistep compound emission is assumed to be isotropic while the angular distribution of the multistep direct emission is described using the fast particle model of Mantzouranis et al. (1975). A similar master equation is used for both chains of states differing only in the angular dependence of the emission rates. The two chains of states are treated independently neglecting inter-branch transitions. The angular distributions for 14.6 MeV neutrons calculated using this model are found to be in better agreement with the data than the fast particle model. (18 refs.)

24.75 GENERAL PROPERTIES OF FISSION

- 112167 A constrained approximation for nuclear barrier penetration and fission. H.H.K.Tang, J.W.Negele (Dept. of Phys., MIT, Cambridge, MA, USA). *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.205-35 (19 Sept. 1983). An approximation to the time-dependent mean-field theory for barrier penetration by a nucleus is obtained in terms of constrained Hartree-Fock wave functions and a coherent velocity field. A discrete approximation to the continuum theory suitable for practical numerical calculations is presented and applied to three illustrative models. Potential application of the theory to the study of nuclear fission is discussed. (12 refs.)
- 112168 Quantal dynamics of dissipation in heavy ion nuclear fission. S.N.Mukherjee, L.N.Pandey (Dept. of Phys., Banaras Hindu Univ., Varanasi, India). *Phys. Rev. C (USA)*, vol.28, no.3, p.1104-8 (Sept. 1983). Energy dissipation during heavy ion nuclear fission has been calculated by employing the one-dimensional time dependent frictional Schrodinger equation. The variation of loss of energy with respect to the shape of the fissioning system follows the same trend as the classical frictional matrix. The dissipative loss of kinetic energy with respect to time is also shown. (14 refs.)
- 112169 Effect of dissipation on the eigensolutions near the fission saddle point. K.Thomas, R.Davies (Phys. Dept., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), J.Rayford Nix, A.J.Sierk. *Phys. Rev. C (USA)*, vol.28, no.3, p.1181-7 (Sept. 1983). Two equivalent methods are developed for solving the problem of small oscillations near equilibrium when dissipative forces are included in the dynamical equations of motion. One method relies on the Lagrangian formulation of the equations of motion, and the other method relies on the Hamiltonian formulation. The eigenvalues are in general complex, but for unstable or overdamped motion they are purely real. The authors use the Lagrangian formulation to calculate the two lowest symmetric eigensolutions at the fission saddle point for nuclei with Z^2/A ranging from 18.0 to 44.6 for ordinary two-body viscosity, one-body wall-formula dissipation, and one-body wall-and-window dissipation. (20 refs.)

25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

- 112170 The photoneutron cross section of ^{151}Eu , ^{153}Eu and ^{156}Gd in the giant resonance region. T.J.Boal, E.G.Muirhead (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia), D.J.S.Findley. *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.257-68 (19 Sept. 1983). The ^{151}Eu , ^{153}Eu and ^{156}Gd photoneutron cross sections in the giant dipole resonance region have been measured using bremsstrahlung from the University of Melbourne betatron. Absolute cross-section values, lorentzian parameters, intrinsic quadrupole moments, deformation parameters and integrated cross-section values are derived. For ^{151}Eu and ^{153}Eu the measured cross sections are in good agreement with the predictions of the extended dynamic collective model. (36 refs.)
- 112171 Pion photoproduction off nuclei: a sensitive test of the nuclear transition densities. R.A.Eramzhyan (Inst. of Nuclear Res., Acad. of Sci., Moscow, USSR), M.Gmitro, S.S.Kamalov. *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.371-4 (8 Sept. 1983). The available (e,e') data in most cases constrain just weakly the nuclear transition densities. As an example the authors have analysed the $^{16}\text{O}(\gamma, \pi^+)^{16}\text{N}$ (bound) reaction using two sets of nuclear matrix elements both consistent with the electromagnetic constraint. In spite of that fact they produce dramatically different photoproduction cross sections. New precise electron scattering data are needed to elucidate the situation. (13 refs.)
- 112172 Charge symmetry breaking in ^4He . D.Halderson, R.J.Philpott (Dept. of Phys., Florida State Univ., Tallahassee, FL, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1000-4 (Sept. 1983). Calculations for $^4\text{He}(\gamma,p)^3\text{H}$ and $^4\text{He}(\gamma,n)^3\text{He}$ have been performed with the recoil-corrected continuum shell model. A charge-symmetry breaking interaction has been introduced in an effort to explain the large value (~ 2) observed in recent experiments for the cross section ratio $R = \sigma(\gamma,p)/\sigma(\gamma,n)$. The calculations indicate that it is highly unlikely that such a large value of the cross section ratio can be obtained within standard theoretical assumptions. (37 refs.)

25.30 LEPTON-INDUCED REACTIONS AND SCATTERING

- 112173 Test of vibrational current distributions in transverse electron scattering. E.Wust, U.Mosel (Inst. fur Theoretische Phys., Univ. Giessen, Giessen, Germany), J.Kunz, A.Schuh. *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.285-90 (19 Sept. 1983). The transition current distribution for the low-lying 2^+ state a 4.085 MeV in ^{208}Pb obtained in a realistic cranked shell-model calculation is used to calculate the transverse PWBA form factor for inelastic electron scattering to this state. By keeping the same density but changing the velocity field to that of irrotational, incompressible flow the sensitivity of the form factor to the dynamics of nuclear vibrational motion is explored. It is found that the two flow patterns lead to significant, observable differences in the form factors. (14 refs.)
- 112174 High-resolution (e,e') study of isovector M1 and M2 transitions in the oxygen isotopes. I. ^{16}O . G.Kuchler, A.Richter, E.Spamer, W.Steffen (Inst. fur Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), W.Knupfer. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.473-9 (26 Sept. 1983). The M1 and M2 transition strength distribution for ^{16}O in the excitation energy range from 16 to 20 MeV has been measured in a high-resolution electron scattering experiment. The M1 strength is concentrated in three sharp states at $E_x = 16.22$, 17.14 and 18.79 MeV (± 0.01 MeV) with $B(M1,k) = 0.20 \pm 0.02$, 0.32 ± 0.03 and $0.13 \pm 0.03 \mu_N^2$, respectively. An additional strength of $0.35 \pm 0.09 \mu_N^2$, distributed over eight weakly excited states with excitation energies $E_x = 17.4$ to 18.0 MeV, brings the total measured M1 strength to $B(M1,k) = 1.0 \pm 0.1 \mu_N^2$. The experimental M2 strength distributed over states at $E_x = 16.82$, 17.78, 18.50 and 19.0 MeV (± 0.01 MeV) with $B(M2,k) = 19 \pm 2$, 13 ± 2 , 59 ± 7 and $341 \pm 51 \mu_N^2 \cdot \text{fm}^2$, respectively. Electric transitions were also measured to states at $E_x = 16.45$ MeV (2^+ , E2), 17.30 MeV (1^+ , E1) and 18.20 MeV (2^+ , E2). Calculations were performed using the modified surface delta interaction in a 2p-2h shell model for the M1 transitions and the random phase approximation for the M2 transitions. The results show the sensitivity of the M1 strength as a measure of ground-

state correlations and compare well with results from the $^{15}\text{N}(\bar{p},\gamma)$ reaction. (21 refs.)

112175 High-resolution (e,e') study of isovector M1 and M2 transitions in the oxygen isotopes. II. ^{17}O . C.Rangacharyulu, E.J.Ansaldo (Dept. of Phys., Univ. of Saskatchewan, Saskatoon, Canada). *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.493-503 (26 Sept. 1983). For pt.I see *ibid.*, vol.406, p.473-492 (1983). In a high-resolution electron scattering experiment, six isospin $T=3/2$ levels in the excitation energy region of 11-15.3 MeV were populated in ^{17}O . Five transitions at $E_x=11.08, 12.47, 12.99, 14.23$ and 14.75 MeV are predominantly of M2 nature with transition strengths $B(\text{M}2,k)=6.1\pm 1.9, 6\pm 3, 6\pm 3, 46\pm 7$ and $27\pm 9 \mu\text{N}^2\text{fm}^2$, respectively. The transition to the 15.10 MeV level is mainly M1 with $B(\text{M}1,k)=0.14\pm 0.04 \mu\text{N}^2$. For this level, a tentative spin-parity assignment of $J^\pi=3/2^+$ is possible. Also, a spin assignment of $J^\pi=9/2^+$ is preferred for the 14.75 MeV level. The comparison of the transition strength to the level at 11.08 MeV with the prediction from the analogous unique first-forbidden β^- decay of the ^{17}N ground state indicates that it may be important to include $p_{3/2}$ -hole configurations in the ground-state wave function of ^{17}O . A comparison made with the corresponding E1 transitions in ^{17}Fe , by estimating the possible longitudinal component for the 14.23 MeV transition and assuming that the 12.99 MeV transition is pure E1, shows that mirror asymmetries in the mass 17 pair may be of non-zero magnitudes. (17 refs.)

112176 High-resolution (e,e') study of isovector M1 and M2 transitions in the oxygen isotopes. III. ^{18}O . D.Bender, A.Richter, E.Spamer (Inst. für Kernphys., Tech. Hochschule Darmstadt, Darmstadt, Germany), E.J.Ansaldo, C.Rangacharyulu, W.Knupfer. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.504-18 (26 Sept. 1983). For pt.II, see *ibid.*, vol.406, p.493-503 (1983). The excitation energy region in ^{18}O from about $E_x=11-27$ MeV has been studied with low-momentum transfer, but high-resolution inelastic electron scattering. Two sharp lines are prominent in the spectra, corresponding to the excitation of $T=2$ levels at 16.399 ± 0.005 MeV and 18.871 ± 0.005 MeV of $J^\pi=2^-$ and 1^+ , respectively. In contradiction to theoretical predictions no more strong M2 transitions could be found. Broad peaks were observed at 18.5, 19.7, 20.2, 22.5 and 23.8 MeV, that latter two are due to the giant dipole resonance as known from photonuclear reactions. The spectra show in addition considerable fine structure and the application of a cross correlation function technique for its analysis resulted in the location of twelve more low multipolarity weak transitions in the excitation energy range between 16 and 19 MeV. Tentative J^π assignments are given for these levels. The spectra of isospin $T=2$ states of $A=18$ nuclei are discussed in view of the existing experimental and theoretical work. Finally, the pattern of the isovector M1 and M2 strength distributions of all the three oxygen isotopes $^{16,17,18}\text{O}$ is discussed. (24 refs.)

112177 (e,e'\pi) reaction on light nuclei and spin-isospin strength distribution effects. J.Cohen, J.M.Eisenberg (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel). *Phys. Rev. C (USA)*, vol.28, no.3, p.1309-17 (Sept. 1983). The authors study threshold pion electroproduction on light $T=0$ nuclei. The probe is essentially interesting because it mixes longitudinal (spin component parallel to momentum transfer, $\vec{\sigma}\cdot\vec{k}$ coupling) and transverse ($\vec{\sigma}\times\vec{k}$ coupling) channels. Using the local density approximation for the treatment of possible nuclear spin-isospin mode enhancements, they calculate cross sections for both exclusive and inclusive measurements. For discrete nuclear levels they study differential cross sections of various pionlike levels, and these are compared with a nonpionlike excitation. The cross sections for exclusive excitations are extremely small except for forward angles. The inclusive cross sections, achieved by summing over all nuclear states, are considerably larger since these include the quasifree excitation. All cases are studied as a function of q' , the Migdal spin-isospin parameter. The authors find a strong influence of kinematical conditions (especially the energy transfer) and of nuclear density on enhancement phenomena. (12 refs.)

112178 Reaction $\mu^- + {}^6\text{Li} \rightarrow {}^3\text{H} + {}^3\text{H} + \nu_\mu$ and the axial current form factor in the timelike region. S.L.Mintz (Florida Internat. Univ., Miami, FL, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1389-92 (Sept. 1983). The differential muon-capture rate $d\Gamma/dE_T$ is obtained for the reaction $\mu^- + {}^6\text{Li} \rightarrow {}^3\text{H} + {}^3\text{H} + \nu_\mu$ over the allowed range of E_T , the tritium energy, for two assumptions concerning the behaviour of F_A , the axial current form factor, in the timelike region; analytic continuation from the spacelike region and mirror behaviour, $F_A(q^2, \text{timelike}) = F_A(q^2, \text{spacelike})$. The values of $d\Gamma/dE_T$ under these two assumptions are found to vary substantially in the timelike region as a function of the mass M_A in the dipole fit to F_A . Values of $d\Gamma/dE_T$ are given for $M_A^2 = 2m_\pi^2, 4.95 m_\pi^2$, and $8 m_\pi^2$. (10 refs.)

112179 Electromagnetic and weak currents in nuclei. T.W.Donnely (Center for Theoretical Phys., MIT, Cambridge, MA, USA). *Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure*, Dronen, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.1-33. The basic formalism used in descriptions of electromagnetic and weak interactions with nuclei is discussed. The author begins by considering the simple problem of electron scattering from a point Dirac proton. This description is improved by allowing the nucleon to have internal structure. Inclusive electron scattering from a nucleus is discussed. A general treatment of the (e,e') reaction is given. In this latter situation, a multipole analysis of the electromagnetic current is dictated. The author concludes the discussion of the electromagnetic interaction with the general formalism involved in treating exclusive electron scattering, (e,e'). The point Dirac nucleon and dressed nucleon weak currents are discussed, followed by consideration of general inclusive reactions and their nuclear response functions. The author concludes by displaying specific forms for a variety of charge-changing and neutral-current weak interaction cross sections. (11 refs.)

112180 Electron scattering. I.Sick (Dept. of Phys., Univ. of Basel, Basel, Switzerland). *Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure*, Dronen, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.223-50. The experimental equipment used for electron scattering experiments obviously is of great diversity. The author describes a 'typical' set by discussing some of the apparatus used at the three highest-energy facilities (Amsterdam, Bates and Saclay). The author discusses some of the development in the determination of ground state charge densities from the electron-nucleus scattering. He also deals with plastic scattering from nuclear magnetisation densities of high multipole order. (42 refs.)

25.40 NUCLEON-INDUCED REACTIONS AND SCATTERING

(see also 28.20 Neutron physics)

112181 Absolute cross sections of proton induced reactions on ^{65}Cu , ^{64}Ni and ^{63}Cu . M.E.Sevior, L.W.Mitchell, M.R.Anderson, C.I.W.Tingwell, D.G.Sargood (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.463-71 (1983). Absolute cross sections have been measured for (p,\gamma) reactions on ^{65}Cu , ^{64}Ni and ^{63}Cu over proton energy ranges of 1.05-3.25, 1.00-3.45 and 1.05-4.70 MeV respectively, for (p,n) reactions over proton energy ranges from threshold to 3.25, 3.80 and 4.86 MeV respectively, and for $^{63}\text{Cu}(p,p)^{63}\text{Cu}$ over a proton energy range of 1.05-4.00 MeV. All the data are compared with global statistical model calculations. The agreement, to within a factor of 2, between theory and experiment is regarded as satisfactory for a global code, but the ^{64}Ni data are suggestive of a closed shell effect at $Z=28$. (15 refs.)

112182 (n,2n) cross-section measurement of ^{93}Nb , ^{197}Au and ^{238}U with fission-neutron spectrum and its dependence on the asymmetry term. G.Shani (Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel). *Ann. Nucl. Energy (GB)*, vol.10, no.9, p.473-6 (1983). The (n,2n) reaction cross section was measured for ^{93}Nb , ^{197}Au and ^{238}U with fission-neutron spectrum from ^{252}Cf sources. The cross-section dependence on the asymmetry term $N-Z/A$ (where N , Z and A are the nucleus neutron, proton and mass numbers) was investigated and found to be an exponential growth. The mathematical function describing $\sigma_{n,2n}=f(N-Z/A)$ is dependent on the incoming neutron energy. The function at fission spectrum is of the shape e^{-x} while at 14-15 MeV it has the shape of $1-e^{-x}$ (where x stands for $N-Z/A$). Looking for an analogy between the asymmetry term dependence and energy dependence, a similar change occurs in the energy-dependent cross section near threshold. (24 refs.)

112183 Clustering effects on neutron elastic scattering from boron isotopes. S.Komoda, T.Sekiya (Dept. of Nuclear Engng., Osaka Univ., Osaka, Japan). *Atomkernenergie. Kerntechnik. (Germany)*, vol.42, no.2, p.101-4 (1983). The phenomenological optical model is applied to boron isotopes and the differential cross section data for neutron elastic scattering from ^{10}B and ^{11}B are reproduced at forward scattering angles at bombarding energies between 7 and 14 MeV. The magnitude of the discrepancy between the theoretical and experimental angular distributions at backward scattering angles decreases smoothly with the bombarding energy. (22 refs.)

112184 Measurement of the total neutron cross-section of germanium at energies below 2 eV. M.Salama (Reactor & Neutron Phys. Dept., Nuclear Res. Center, Atomic Energy Establish., Cairo, Egypt). *Atomkernenergie. Kerntechnik. (Germany)*, vol.42, no.2, p.105-6 (1983). The total neutron cross-section of germanium has been measured at room temperature as a function of neutron energy in the range between 2.2 eV and 7 meV for randomly distributed crystals of germanium by transmission method using a chopper time-of-flight spectrometer at ET-RR-1 research reactor. The measured cross-section showed an evidence of $1/v$ thermal slope in the energy range 1.20 eV to 0.20 eV. Crystal structure effects were also observed. Calculations were performed giving values for the coherent scattering amplitude as well as the coherent scattering cross-section. The results obtained showed also the absence of scattering nuclear spin dependence in case of germanium. (14 refs.)

112185 The activation cross-sections for (n,\gamma) reactions using ^{241}Am -Be neutron source. K.Kaminishi, S.Nureki (Dept. of Appl. Phys., Miyazaki Univ., Miyazaki, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1070 (June 1983). Reports the values of the activation cross-sections for more than twenty samples. The reported values were determined from the value of the thermal neutron cross-section of ^{197}Au , while previous results were obtained from that of aluminium. (2 refs.)

112186 On two-nucleon absorption of antiprotons by complex nuclei. A.S.Iljiov, V.L.Matushko (Inst. for Nuclear Res., Acad. of Sci., Moscow, USSR), G.Piragino. *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.3, p.83-6 (17 Sept. 1983). It is shown that the antiprotons can be absorbed by correlated pairs of intranuclear nucleons, with subsequent emission of a high-energy pion and nucleon pair. The estimation of the cross-section values of this process, performed on the framework of the quasi-deuteron model, shows the possibility of experimental detection of the \bar{p} two-nucleon absorption process. (11 refs.)

112187 Differential cross sections and analyzing powers for \bar{p} elastic scattering below 1.0 MeV. E.Hüttel, W.Arnold, H.Berg, H.H.Krause, J.Ulbricht, G.Clausnitzer (Inst. für Kernphys., Justus-Liebig-Universität Giessen, Giessen, Germany). *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.435-42 (26 Sept. 1983). Differential cross sections for the elastic \bar{p} scattering were measured at seven energies between 0.4 and 1.0 MeV for scattering angles from $\theta_{\text{c.m.}}=44.5^\circ$ to 149.2° . A mixture of D_2 and Kr was used as target gas and the \bar{p} differential cross sections were determined relative to those of pKr scattering with a statistical error of $\Delta\sigma/\sigma \sim 5 \times 10^{-3}$. Analyzing power for \bar{p} scattering were measured at 0.8, 0.9 and 1.0 MeV with a statistical error of $\Delta A_y \sim 5 \times 10^{-4}$. (27 refs.)

112188 Phase-shift analysis of \bar{p} elastic scattering below break-up threshold. E.Hüttel, W.Arnold, H.Baumgart, H.Berg, G.Clausnitzer (Inst. für Kernphys., Justus-Liebig-Universität Giessen, Giessen, Germany). *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.443-55 (26 Sept. 1983). A phase-shift analysis was performed for \bar{p} elastic scattering based on measurements of differential cross sections and proton and deuteron analyzing powers for energies below the break-up threshold. The angular momenta were restricted to $l \leq 3$; j -splitting and channel-spin mixing of the P-phases and the tensor coupling between the S- and D-phases were taken into account. The phase shifts were parameterized by the effective-range formalism and the corresponding parameters were directly deduced from the data. The results are compared with Faddeev calculations in which the Coulomb interaction is treated exactly or as a two-body approximation. (27 refs.)

112189 Investigation of the level scheme of ^{145}Nd in the $(n,n'\gamma)$ reaction. L.I.Govor, A.M.Demidov (Kurchatov Atomic Energy Inst., Moscow, USSR), M.A.Al-Amili, T.J.Al-Janabi, V.D.Avchukhov, K.A.Baskova, A.B.Vovk. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.456-72 (26 Sept. 1983). The spectrum of γ -rays from the inelastic scattering of reactor fast neutrons on ^{145}Nd is measured. The authors observed 169 γ -lines in the γ -ray spectrum and, among them, 94 γ -lines for the first time. The γ -transition scheme for ^{145}Nd is constructed. New levels are introduced for the most intense transitions. Multipole mixtures are determined from the measured angular distributions of γ -rays. The angular momenta for some of the levels are determined and the low-lying levels in ^{145}Nd are discussed. (13 refs.)

112190 Low-lying levels, γ -ray transitions, and vibrational structure in ^{198}Pt from $(n,n'\gamma)$ reaction spectroscopy. S.W.Yates, A.Khan, A.J.Filo (Dept. of Chem., Univ. of Kentucky, Lexington, KY, USA), M.c.Mirzaa, J.L.Weil, M.T.McEllistrem. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.519-32 (26 Sept. 1983).

Low-lying states in ^{198}Pt have been studied by $(n,n'\gamma)$ reaction spectroscopy at incident neutron energies below 2.5 MeV. Using detailed γ -ray excitation functions and angular distribution measurements, the authors have established a level scheme which includes 16 excited levels and is believed to include all levels below an excitation energy of 1.5 MeV. The positive-parity structure is believed to include all levels below an excitation energy of 1.5 MeV. The positive-parity structure is similar to the expected of an anharmonic vibrator; however, difficulties in asserting that the first 0^+ excited level is a collective excitation are encountered. Only two negative-parity states are observed, and they are adequately described in the semi-decoupled model. (22 refs.)

112191 Parity violation in neutron elastic scattering around compound nucleus resonances. S.Noguera, J.Bernabeu (Dept. de Física Teórica, Univ. de Valencia, Valencia, Spain).

Phys. Lett. B (Netherlands), vol.129B, no.1-2, p.125-9 (15 Sept. 1983). The parity-conserving asymmetry for elastic scattering of polarized neutrons in the energy region around compound nucleus resonances is considered. The mechanism of virtual excitation of the parity admixed compound nucleus state is used. The parity conserving elastic amplitudes are dominated by s wave, but the simultaneous presence of the p wave resonant state is crucial for the parity violating amplitudes. Effects for n - ^{117}Sn scattering are at the level of 10^{-5} - 10^{-6} , with a very peculiar energy dependence around the s wave resonance. (17 refs.)

112192 Gamma-ray transitions among levels of ^{206}Pb . J.K.Dickens (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Phys. Rev. C (USA), vol.28, no.2, p.916-18 (Aug. 1983). A study of γ -ray data produced by neutron inelastic scattering from a lead sample enriched in the isotope ^{206}Pb has resulted in placements of 106 γ rays as transitions among 88 known or postulated levels of the ^{206}Pb level structure. (16 refs.)

112193 Strong absorption limit of the Blankenbecler-Goldberger amplitude. R.J.Lombard (Div. de Phys. Théorique, CNRS, Inst. de Phys. Nucleaire, Orsay, France).

Phys. Rev. C (USA), vol.28, no.2, p.938-40 (Aug. 1983). The strong absorption limit of the Blankenbecler-Goldberger amplitude for hadron-nucleus elastic scattering is studied by calculating the total cross section using the optical theorem, and comparing the results to values obtained in the Glauber model. It is shown that in spite of many defects, the Blankenbecler-Goldberger amplitude yields results not too far from those of Glauber. This is due to the fact that most of the elastic scattering is concentrated in the nuclear surface, and that the two multiple scattering expansions agree in low density regions. (5 refs.)

112194 Search for two-phonon vibrations in ^{168}Er . E.W.Kleppinger, S.W.Yates (Dept. of Chem., Univ. of Kentucky, Lexington, KY, USA).

Phys. Rev. C (USA), vol.28, no.2, p.943-5 (Aug. 1983). The low-lying level structure of ^{168}Er has been examined by the $(n,n'\gamma)$ reaction and all known levels with $J < 7$ and $E \leq 2.0$ MeV are observed. The discovery of a level at 1893 keV calls for a reexamination of the completeness of the level scheme assumed previously for this nucleus. No new low-lying candidates for two-phonon γ vibrations are observed. (13 refs.)

112195 Yields of medium mass nuclear fragments: statistical emission. W.A.Friedman (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA), W.G.Lynch.

Phys. Rev. C (USA), vol.28, no.2, p.950-2 (Aug. 1983). The results of a calculation using a newly developed statistical emission formalism are compared with the recently published data of Finn et al. for nuclear fragment yields from high energy proton-nucleus interactions on ^{132}Xe . Good agreement is noted. (3 refs.)

112196 $^{14}\text{N}(\bar{p},p)^{14}\text{N}(2.31 \text{ MeV})$ reaction at 159.4 MeV. T.N.Taddeucci, J.Rapaport (Dept. of Phys., Ohio Univ., Athens, OH, USA), C.C.Foster, J.R.Comfort.

Phys. Rev. C (USA), vol.28, no.3, p.969-76 (Sept. 1983). Differential cross-section and analyzing-power angular distributions have been measured for the elastic scattering of 159.4 MeV protons on ^{14}N and for the inelastic transitions to the 2.31-MeV and 3.95-MeV states. Elastic-scattering data for \bar{p} - ^{12}C and inelastic data for the $^{12}\text{C}(\bar{p},p)^{12}\text{C}(4.44 \text{ MeV})$ reaction have also been obtained at the same energy as a normalization check. The $^{14}\text{N}(\bar{p},p)^{14}\text{N}(2.31 \text{ MeV})$ transition has been analyzed in the distorted-wave impulse approximation. This transition has long been regarded as a favorable test for the tensor component of the effective nucleon-nucleon interaction. Calculations employing wave functions that provide the necessary cancellation of the $L=0$ central-interaction transition strength do not provide a good description of the differential cross-section angular distribution. It is suggested that more complicated reaction mechanisms, e.g. (p,d)/(d,p') contributions, may be needed to describe this transition. (25 refs.)

112197 Measurements of the ^3He and ^4He total neutron cross sections up to 40 MeV. B.Haesner, W.Heeringa, H.O.Klages, H.Dobiasch, G.Schmalz, P.Schwarz, J.Wilczynski, B.Zeitnitz (Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

Phys. Rev. C (USA), vol.28, no.3, p.995-9 (Sept. 1983). The total neutron cross sections of the helium isotopes were measured in the energy range from 1.5 to 40 MeV. A continuous energy neutron source was used in connection with a 190 m long flight path and high resolution time-of-flight techniques. The energy resolution achieved enabled the authors to improve considerably the parameters of the narrow $^3/2^+$ resonance in the n - ^4He system. The position of the resonance was found to be 22133 ± 10 keV, with a total width of 76 ± 12 keV and a neutron width of 37 ± 5 keV. This agrees well with previous analyses, which yield $\Gamma_n \sim 1/2$. Absolute values for the cross sections were determined with an overall error smaller than 3%. Comparison with older data shows agreement within the total errors. The data are 4% to 5% higher than the most recent data set; however, in the case of ^3He , the data are still below the predictions from an R-matrix analysis. It was pointed out recently that a slight disagreement exists between the

total neutron cross section of ^3He and the sum of the partial n - ^3He cross sections. This discrepancy is removed by the new data. (16 refs.)

112198 Proton capture by ^{15}N above the giant dipole resonance. M.Ang-hinolfi, P.Corvisiero, G.Ricco, M.Sanzone, M.Taiuti, A.Zucchiatti (Istituto di Sci. Fisiche, Univ. di Genova, Genova, Italy).

Phys. Rev. C (USA), vol.28, no.3, p.1005-11 (Sept. 1983). The proton capture cross sections to the ground and excited states of ^{16}O have been measured at several angles in the proton energy interval between 18 and 40 MeV. The ground state angular distribution, which shows a significant $E1$ - $E2$ interference effect above 40 MeV, results in reasonable agreement with semidirect capture calculations. Transitions to final bound and unbound $1p$ - $1h$ states in ^{16}O having a dominant $1p_{1/2}^{-1}$ hole have also been measured. Resonances built on these residual states have been systematically observed above $E_p = 20$ MeV; the possible interpretation of these states as giant dipole resonances built on excited states is discussed. (27 refs.)

112199 Elastic and inelastic scattering of polarized protons from ^{206}Pb near isobaric analog resonances. N.L.Back, J.G.Cramer (Nuclear Phys. Lab., Univ. of Washington, Seattle, WA, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1040-59 (Sept. 1983). Excitation functions have been measured for the elastic and inelastic scattering of polarized protons from ^{206}Pb at $\theta_{\text{lab}} = 120^\circ$, 135° , 150° , and 165° in the energy range $E_p = 14.25$ - 18.00 MeV. Excellent fits to the elastic scattering data were obtained using a parametrized background and the isobaric analog resonances of 35 states in ^{207}Pb (the 'parent states') with $E_x = 2.3$ - 5.7 MeV; spin-parity assignments and resonance parameters were determined for all of these isobaric analog resonances. The data for inelastic scattering to the first excited state (2^+ , 0.803 MeV) were described using a distorted-wave Born approximation background and the same isobaric analog resonances; good fits to the data were obtained by varying only the inelastic partial width amplitudes. A set of spectroscopic amplitudes was then found, for both the single-particle and the particle-core components of the parent states, by comparing the best-fit resonance parameters with those given by model calculations. The internal consistency of this set was verified by using sum rules. The spectroscopic amplitudes are compared with those given by simple weak-coupling model predictions; there is considerable disagreement, probably because too few configurations were used in the theoretical calculations. (42 refs.)

112200 Highly excited hole strength observed in the $^{90}\text{Zr}(\bar{p},d)^{89}\text{Zr}$ reaction. J.Kasagi, G.M.Crawley, E.Kashy, J.Duffy (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA), S.Gales, E.Gerlic, D.Friesel.

Phys. Rev. C (USA), vol.28, no.3, p.1065-8 (Sept. 1983). The $^{90}\text{Zr}(\bar{p},d)^{89}\text{Zr}$ reaction has been studied at $E_p = 90$ MeV. Using analyzing power measurements, gross structures observed between $E_x \sim 3.4$ and $E_x \sim 7.0$ MeV are deduced to arise mainly from the pickup of $1f_{5/2}$ neutrons. Between 7.0 and 19 MeV, the main strength comes from the $1f_{7/2}$ transfer although $1d_{3/2}$ strength has also been observed between 16.0 and 20.0 MeV of excitation energy. (14 refs.)

112201 $^7\text{Be}(p,\gamma)^8\text{B}$ cross section at low energy. F.C.Barker (Dept. of Theoretical Phys., Australian Nat. Univ., Canberra, Australia).

Phys. Rev. C (USA), vol.28, no.3, p.1407-8 (Sept. 1983). The low-energy logarithmic derivative of the S factor for $^7\text{Be}(p,\gamma)^8\text{B}$ calculated by Williams and Koonin (1981) using only asymptotic wave functions differs from that obtained with a potential model. It is suggested that this is due at least in part to an inappropriate choice of nuclear phase shift in the former calculation. (9 refs.)

112202 Complex spin-orbit potential for $^{208}\text{Pb}(n,n)^{208}\text{Pb}$ at 10 MeV. J.P.Delaroche, C.E.Floyd, P.P.Guss, R.C.Byrd, K.Murphy, G.Tungate, R.L.Walter (Dept. of Phys., Duke Univ., Durham, NC, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1410-13 (Sept. 1983). The analyzing power $A_y(\theta)$ and differential cross section $\sigma(\theta)$ have been measured for elastic scattering of 10-MeV neutrons from ^{208}Pb . These data were analyzed with a spherical optical model which has a real spin-orbit potential with either a three-parameter conventional form or a one-parameter semimicroscopic form. The predictions with both spin-orbit potentials reproduce the data equally well, suggesting that fewer free parameters can be used in spherical optical model calculations. Including an imaginary spin-orbit term $W_{\text{SO}}(r)$ in the optical potential greatly improves the fits to the $A_y(\theta)$ measurements and establishes the need for $W_{\text{SO}}(r) \neq 0$ in the n - ^{208}Pb potential. (9 refs.)

112203 Energy dependence of the relativistic impulse approximation for proton-nucleus elastic scattering. B.C.Clark, S.Hama (Dept. of Phys., Ohio State Univ., Columbus, OH, USA), R.L.Mercer, L.Ray, G.W.Hoffman, B.D.Serot.

Phys. Rev. C (USA), vol.28, no.3, p.1421-4 (Sept. 1983). Results of relativistic and nonrelativistic impulse approximation calculations are compared for p - ^{40}Ca elastic scattering observables between 181 and 1040 MeV. At 400 MeV and above, the relativistic approach is superior, especially with regard to spin observables. Below 400 MeV, neither calculation agrees well with experiment. (17 refs.)

112204 Elastic scattering and inelastic scattering of 65 MeV polarised protons. H.Sakaguchi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.58-77. Elastic scattering of 65 MeV polarised protons from 35 nuclei (^{16}O - ^{209}Bi) and inelastic scattering from rare earth nuclei have been measured. Based on the analysis of the systematic data, the following topics are discussed: (1) mass number dependence of the mean square radius of the optical potential; (2) energy and mass number dependence of the volume integral of the optical potential; (3) anomaly observed in J_g and J_p for rare earth nuclei; (4) quadrupole moments measured by proton scattering are larger than quadrupole moments measured by electron scattering. (27 refs.)

112205 Polarizations, analysing powers and spin-current couplings in inelastic proton scattering. W.G.Love (Dept. of Phys. & Astron., Univ. of Georgia, Athens, GA, USA).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.110-23. Non-local spin-dependent couplings in the effective nucleon-nucleon interaction are shown to probe current-spin correlations in inelastic nuclear excitations. Together, these couplings and correlations provide an important dynamical source of polarisation-analyzing power differences observed in inelastic proton scattering. In most of the presently used models of inelastic scattering this type of coupling arises from knockon exchange effects. Plane wave impulse approximation (PWIA) results are given for $0^+ \rightarrow 1^+$ transitions to illustrate explicitly the role of these current-spin couplings in calculations of

P and A. The very selective $0^+ \rightarrow 0^-$ transitions are also briefly considered. (28 refs.)

112206 Effective interactions in (p,p') and (p,n) excitations. M.Yabe (Dept. of Phys., Faculty of Sci., Tokyo Metropolitan Univ., Setagaya-ku, Tokyo, Japan), A.Mori, K.Kubo. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.124-8
The authors analysed the proton inelastic scatterings and the charge exchange reactions to investigate the effective interactions and the reaction mechanisms. Firstly they report necessity of modification of the M3Y effective interaction in the framework of one-step and two-step processes. Secondly they compare this modified M3Y interaction with one constructed from the transition matrix based on Brueckner-Hartree-Fock treatment. The interaction is dependent on nuclear density with complex Gaussian form. Justification of the modification is then argued. (12 refs.)

112207 Unnatural parity states studied in high resolution (p,p') experiments at 65 MeV and the effective nucleon-nucleon interaction. M.Fujiwara, S.Imanishi, Y.Fujita, S.Morinobu, I.Katayama, T.Yamazaki, T.Itahashi, H.Ikegami (Res. Centre for Nuclear Phys., Osaka Univ., Ibaraki, Osaka, Japan), K.Katori, S.I.Hayakawa. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.134-52
The authors present experimental results and microscopic PWBA analyses of the (p,p') reactions at 65 MeV performed at RCNP. They focus mainly on the excitation of unnatural parity states in ^{40}Ca , ^{90}Zr , and ^{208}Pb . It was found that in order to fit the experimental data of the 1p-1h neutron excitations by the microscopic DWBA calculations using the M3Y interaction, a common renormalisation factor of about 0.3 was needed. (39 refs.)

112208 Magnetic states observed in high-resolution (p,n) experiments. H.Orihara, C.D.Zafiratos (Cyclotron & Radioisotope Center, Tohoku Univ., Sendai, Japan), S.Nishihara, K.Furukawa, M.Kabasawa, T.Nakagawa, K.Maeda, K.Miura, G.C.Kiang, H.Ohnuma. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.176-95
A study of magnetic (unnatural-parity) states observed in charge-exchange (p,n) experiments is presented. The (p,n) reactions on ^{12}C , ^{14}C , ^{16}O , ^{24}Mg and ^{28}Si have been investigated at $E_p=35$ MeV by means of the time-of-flight technique. Feasibility of analyses for the low-energy (p,n) data with use of the proposed realistic nucleon-nucleon interactions is discussed. Analyses for angular distributions of the differential cross section for the transitions of the spin-isospin type such as from 0^+ to 0^- , 2^- , 4^- and 6^- states are presented. (20 refs.)

112209 Lane model analysis of 80 MeV (p,n) IAS reactions. D.A.Lind, T.G.Masterson, R.S.Raymond, E.Sugarbaker, C.D.Zafiratos (Univ. of Colorado, Boulder, CO, USA), C.C.Foster. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.206-13
Angular distributions for the (p,n) IAS transition were measured for the targets $^{90,92,94}\text{Zr}$ and $^{112,116,124}\text{Sn}$ at $E_p=80$ MeV. These data were compared to a Lane model calculation using an existing global optical potential for protons. The real central isovector portion of that potential was a volume form and failed to fit the shape of the angular distribution, although the magnitude was reasonable. Changing the volume form to a surface-peaked form led to improved agreement with the data. Predictions of (p,n) IAS analyzing powers were made with this modified isovector potential and they differ considerably from those obtained with the global parameters. Measurement of those analyzing powers would help test the validity of the Lane model at 80 MeV. (8 refs.)

112210 Energy dependence of analyzing powers for the isoscalar and isovector transitions in (p,p') reaction. K.Hosono, N.Matsuoka, K.Hatanaka, M.Fujiwara, Y.Fujita, T.Saito, T.Noro, M.Kondo (Res. Centre for Nuclear Phys., Osaka Univ., Osaka, Japan), S.Kato, K.Okada, K.Ogino, Y.Kadota, S.Matsuki. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.246-9
Cross sections and analyzing powers in proton inelastic scattering leading to the 1^+ ($T=0$ and $T=1$) states in ^{12}C , the 6^- ($T=0$ and $T=1$) states in ^{28}Si and the 10.218 MeV, 1^+ state in ^{48}Ca were measured at 65 MeV. The data is compared with the results obtained at higher incident energies. In ^{12}C and ^{28}Si , the shapes of the analysing powers for the $T=0$ transitions vary drastically while those for the $T=1$ transitions do not vary with the incident energy. The authors briefly comment on the behaviour of the analysing power for the 10.218 MeV, 1^+ state in ^{48}Ca with the incident energy. (13 refs.)

112211 Characteristic 7^- and 5^- states observed in the (p,t) reactions on even-even rare earth nuclei. Y.Ishizaki, S.Kubono, Y.Iwasaki (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), T.Tohei, T.Nakagawa, J.Hirota, T.Suehiro, K.Miura, S.Kato, S.I.Hayakawa. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.468-72
The (p,t) reactions have been studied for the even-even rare earth nuclei with 40 MeV proton beam from the INS SF cyclotron. A pair of 7^- and 5^- states was observed with large cross sections in each of the nuclei with the neutron number (N) ranging from 86 to 100. For $^{140,142}\text{Nd}$ of $N=80$ and 82 the data were obtained at KVI in Groningen, and the data for ^{152}Sm of $N=90$ at MSU. Q value systematics of (p,t) reactions to these states seem to suggest that these are excited by the two neutron pick-up from the neutron core of $N=82$. The (p,t) cross sections leading to these states of N from 82 to 96 are nearly constant. (8 refs.)

112212 (p,t) and (p, ^3He) reactions on ^{52}Cr and ^{54}Fe populating analog final states with $T_1=T_2$. T.Yamazaki, Y.Fujita, M.Fujiwara, S.Morinobu (Res. Center for Nuclear Phys., Osaka Univ., Osaka, Japan), S.I.Hayakawa, K.Katori, S.Imanishi, M.Nomura, H.Ikegami. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.473-6
The angular distributions of the (p,t) and (p, ^3He) reactions on ^{52}Cr and ^{54}Fe to analog final states (isospin $T_1=T_2$) were studied. The contribution of the sequential p-d-t and p-d- ^3He processes is rather small. The difference of angular distributions to 4^+ states of $^{52}\text{Cr}(p,t)$ and $^{52}\text{Cr}(p,^3\text{He})$ reactions shows the possible presence of the sequential process. (6 refs.)

112213 Study of one- and two-step processes in $^{208}\text{Pb}(p,t)^{206}\text{Pb}(0^+, 0_2^+)$ reactions by using analyzing powers at $E_p=22$ and 50 MeV. H.Iida, Y.Aoki, K.Hashimoto, K.Nagano, H.Sakamoto, M.Takei, Y.Tagishi, K.Yagi (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.477-81
A marked difference between two $0^+ \rightarrow 0^+$ analyzing powers for $^{208}\text{Pb}(p,t)^{206}\text{Pb}$ (0_1^+ and 0_2^+) reactions is observed at $E_p=22$ and 50 MeV. The difference is explained successfully by taking into account sequential transfer processes as well as a one-step process at $E_p=22$ MeV. The difference of the interference between the one- and the two-step processes, which is due to the difference of nuclear-structure wave functions, is essential to explain the two $0^+ \rightarrow 0^+$ analyzing powers. The parameters employed in the (p,t) analyses reproduce the experimental data of the $^{208}\text{Pb}(p,d)^{207}\text{Pb}$ and $^{208}\text{Pb}(d,t)^{206}\text{Pb}$ reactions. The difference between the analyzing powers for the 0_1^+ and 0_2^+ transitions is not reproduced by taking into account only the one-step process. The two-step contributions play an important role at $E_p=50$ MeV. (5 refs.)

112214 Direct contribution to the $^{19}\text{F}(p,\alpha)^{16}\text{O}$ reaction. T.Inoue, A.Isoya (Faculty of Sci., Kyushu Univ., Fukuoka, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.482-6
The excitation functions have been measured for the reaction $^{19}\text{F}(p,\alpha)^{16}\text{O}$ leading to the first several states of ^{16}O in the incident proton energy range between 4.15 and 13.0 MeV in steps of 50 keV at $\theta_{\text{lab}}=30^\circ$, 70° , 120° and 160° . Ericson fluctuation analysis has been carried out and the fractions of direct reaction contributions in the differential cross sections have been deduced for the transitions to the ground state and to the first excited state of ^{16}O using a probability distribution formula of differential cross section. (13 refs.)

112215 Effects of indirect knockout process in quasifree scattering. Y.Ikebata, Y.Kudo (Dept. of Phys., Osaka City Univ., Osaka, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.512-16
Within the framework of the distorted wave impulse approximation (DWIA), the effects of the indirect proton-core nucleus knockout process (IK process) are investigated in the (p,2p) reactions for light target nuclei (^{14}N , ^{16}O and ^{19}F). (9 refs.)

112216 Analyzing power of neutron continuum spectra for the $^{93}\text{Nb}(\bar{p},nX)$ reaction at 65 MeV. H.Sakai, K.Hatanaka, N.Matusoka (Res. Center for Nuclear Phys., Osaka Univ., Osaka, Japan), T.Motobayashi, T.Saito, T.Shibata, A.Shimizu. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.610-16
Analyzing power of neutron continuum spectra for the $^{93}\text{Nb}(\bar{p},nX)$ reaction at 65 MeV has been measured for the wide angular range $\theta_n=20^\circ\text{--}130^\circ$. The analyzing powers are positive and large for the large angles $\theta_n>40^\circ$. The characteristic features in the analyzing power for the $^{93}\text{Nb}(\bar{p},nX)$ reaction are very similar to those for the $^{93}\text{Nb}(p,p'X)$ reaction indicating the importance of a common reaction mechanism for both reactions. A simple single step DWBA calculation was performed to compare with the data. (12 refs.)

112217 Evidence for a secondary doorway state in $A=13$ nuclei from unpolarized and polarized capture measurements. J.G.Woodworth (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), R.A. August, N.R. Roberson, D.R. Tilley, H.R. Weller, J.W. Jury. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.855-60
Cross section, angular distribution and analyzing power measurements show structure and interference effects in neutron, proton and deuteron capture into the $A=13$ system at about 20 MeV excitation energy. By introducing a secondary doorway state at 20.6 MeV with a 0.5 MeV width it is possible to explain the shape of the $^{12}\text{C}(n,\gamma_0)^{13}\text{C}$ and $^{12}\text{C}(p,\gamma_0)^{13}\text{N}$ cross sections as well as the fluctuations observed in the experimental angular distributions and analyzing powers. (5 refs.)

112218 Medium energy gamma rays following radiative capture of 40 and 50 MeV polarized protons on ^{11}B and ^{12}C . M.Noumachi, T.Shibata, K.Okada, T.Motobayashi (Dept. of Phys., Osaka Univ., Osaka, Japan), T.Kishimoto, F.Ohtani, H.Ejiri. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.870-6
Medium energy (40~60 MeV) γ -rays following radiative capture of 40 and 50 MeV polarized protons on ^{11}B and ^{12}C were studied for the first time by using the NaI detector ensemble 'HERMES' with good energy resolution and good S/N ratio. Discrete γ -rays feeding the low-lying states in ^{12}C and ^{13}N , and prominent γ peaks feeding the 19 and 22 MeV excitation regions in ^{12}C were identified. All these gamma rays show uniformly a forward peak angular distributions, while the analyzing powers depend on the microscopic configurations of the final states. (11 refs.)

25.50 ^2H - AND ^3H -INDUCED REACTIONS AND SCATTERING

- 112219 The $^{52}\text{Cr}(p)^{54}\text{Cr}$ reaction at $E_p=15$ MeV. D.L. Watson, M.A. Abouzeid (Postgraduate School of Studies in Phys., Univ. of Bradford, Bradford, England), H.T. Fortune, L.C. Bland, J.B. McGrory. *Nucl. Phys. A (Netherlands)*, vol. A406, no. 2, p.297-305 (19 Sept. 1983). Using the $^{52}\text{Cr}(p)^{54}\text{Cr}$ reaction at a bombarding energy of 15 MeV excitation energies have been measured for 30 levels up to $E_x=5.583$ MeV in ^{54}Cr . Angular distributions were obtained for all but one of these levels; these have been compared with distorted-wave Born approximation (DWBA) calculations to determine the L -transfer (and hence J^π). The measured cross sections have been compared to the predictions of DWBA calculations that use two-neutron transfer amplitudes from a shell-model calculation with the active neutrons restricted to the $(2p_{3/2}, 1f_{5/2}, 2p_{1/2})$ orbitals. (17 refs.)
- 112220 Calculation of proton-neutron coincidence cross sections in 56 MeV deuteron-induced breakup reactions by post form distorted-wave Born approximation. G. Baur, R. Shyam (Inst. fur Kernphys., KFA Julich, Julich, Germany), F. Rosel, D. Trautmann. *Phys. Rev. C (USA)*, vol. 28, no. 2, p.946-9 (Aug. 1983). Recently measured neutron-proton angular correlations in the deuteron-induced breakup reactions at 56 MeV incident energy have been analyzed in terms of the post form distorted-wave Born approximation theory of breakup reactions. Comparison of the present results is made with those of the prior form distorted-wave Born approximation calculations. It is found that the results of the post form distorted-wave Born approximation calculations are in better agreement with the experimental data than the prior form distorted-wave Born approximation results. (17 refs.)
- 112221 (d,α) reaction and the α particle D state. J.A. Tostevin (Dept. of Phys., Univ. of Surrey, Guildford, England). *Phys. Rev. C (USA)*, vol. 28, no. 2, p.94-4 (Aug. 1983). The recent suggestion that the effects of a D -state component of the α particle are being seen in (d,α) reaction tensor analyzing power data is reexamined using exact finite range distorted-wave Born approximation calculations. Results for $^{32}\text{S}(d,\alpha)^{30}\text{P(g.s.)}$, at $E=16$ MeV, are in considerable variance with two-nucleon-core relative motion amplitudes derived from shell model calculations. (15 refs.)
- 112222 Elastic and rearrangement scattering between two interacting deuterons as a four-body problem. A. Osman (Internat. Centre for Theoretical Phys., Trieste, Italy). *Phys. Rev. C (USA)*, vol. 28, no. 3, p.1025-32 (Sept. 1983). A four-body model is used in studying the four-nucleon system. This model is solvable and can be applied to nuclear reactions involving four nucleons. Intermediate quasiparticle states are used for the two- and three-body scattering leading to T matrices which are separable. The model leads to four-body equations which, by using partial wave decomposition, are reduced to single variable integral equations. Numerical calculations of the differential cross sections of the nuclear reactions $^2\text{H}(d,p)^3\text{H}$, $^2\text{H}(d,n)^3\text{He}$, and $^2\text{H}(d,d)^2\text{H}$ are carried out for different deuteron laboratory energies between 6.1 and 51.5 MeV. Inclusion of the p -wave three-body amplitudes is tested. Also, the simultaneous exchange of two nucleons between the incoming deuterons is investigated. The theoretically calculated angular distributions are in good agreement with the experimental measurements. The extracted values of the spectroscopic and normalization factors are reasonable. (18 refs.)
- 112223 Evidence for an imaginary spin-orbit term in deuteron optical potential from analysing power measurements of inelastic scattering. M. Takei, Y. Aoki, K. Hashimoto, H. Iida, K. Nagano, H. Sakamoto, H. Tanaka, Y. Tagishi, K. Yagi (Inst. of Phys. & Tandem Accelerator Centre, Univ. of Tsukuba, Ibaraki, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.53-7. Differential cross sections $\sigma(\theta)$, vector analysing powers $iT_{11}(\theta)$ and tensor analysing powers $T_{20}(\theta)$, $T_{21}(\theta)$ and $T_{22}(\theta)$ have been measured for elastic and inelastic scattering exciting the first 2^+ and 3^- states from $^{104,106}\text{Pd}$ by using a 21 MeV polarised deuteron beam. The analysis was made with the optical potential model and the first-order distorted-wave Born approximation calculations. It was found that an imaginary spin-orbit potential had a significant role in reproducing the iT_{11} data for the inelastic scattering. (4 refs.)
- 112224 The difference in $d\text{-}^{12}\text{C}$ total cross section for $P_{zz}=+1$ and -1 tensor polarised beam. K. Imai (Dept. of Phys., Kyoto Univ., Kyoto, Japan), K. Hatanaka, T. Ichihara, N. Matsuoka, K. Nisimura, T. Saito, H. Sakaguchi, T. Yoshida, M. Yosoi. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.129-33. The difference in $d\text{-}^{12}\text{C}$ total cross section for $P_{zz}=+1$ and -1 tensor polarised beam ($\Delta\sigma_{\text{tot}}$) has been measured for the first time. ($\Delta\sigma_{\text{tot}}$) is sensi-

tive to the tensor potential due to the D -state of the deuteron. The present result ($+2.4 \pm 2.0$ mb) is inconsistent with the value (-20 mb) predicted from folding model optical potential. (4 refs.)

112225 Polarization transfer in $A(d,pX)$ reactions. H. Sakamoto, M. Nakamura, H. Sakaguchi, H. Ogawa, S. Kobayashi (Dept. of Phys., Kyoto Univ., Kyoto, Japan), S. Kato, N. Matsuoka, K. Hatanaka, T. Noro. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.487-91. The transverse vector-to-vector polarization transfer coefficient K_y^y of inclusive protons emitted from deuteron induced reactions on targets on ^{12}C , ^{38}Ni and ^{209}Bi has been measured at 13.5° and 20.0° (lab) at $E_d=56$ MeV for the first time. The coefficient has been obtained for energy bins, center values of which are 22, 26, 31 and 36 MeV and width of which is ± 2 MeV. Though the K_y^y values obtained are roughly close to $2/3$ which is expected from a simple spectator model, a considerable decrease of K_y^y from $2/3$ is observed at the lower energy tail of the spectrum for all the targets studied. Another behavior of K_y^y lowered from $2/3$ can be seen at the higher tail. (6 refs.)

112226 DWBA with 'unrestricted' distorting potentials for (d,p) reactions with strongly coupled d - and p -channels. Y. Iseri, M. Kawai (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.492-7. Attempts have been made to justify DWBA in terms of the coupled-channel (CC) method. It has been maintained (Ichimura and Kawai, 1983) that for inelastic scattering DWBA works, even when the coupling between the initial and final channels is strong, the distorting potentials are adjusted to fit the CC elastic cross sections. On the other hand, it was shown that for (d,p) reactions DWBA failed to reproduce CC results as long as distorting potentials were restricted to the standard Woods-Saxon type. The purpose of the work is to examine the same problem, relaxing, however, the restriction on the distorting potential by allowing the potential to have a wine-bottle shape, l -dependence or non-locality. (4 refs.)

112227 Measurement of vector analyzing power in the reaction $^{12}\text{C}(\bar{d},^6\text{Li})^8\text{Be}$. T. Yamaya, K. Takimoto, S. Shimoura, A. Sakaguchi, M. Fukada (Dept. of Phys., Tohoku Univ., Sendai, Japan), S. Kato, J. I. Hirota, S. Kubono, M. Sugitani, T. Suehiro. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.498-501. The vector analyzing power and the differential cross sections have been measured for the ground state and the excited states of ^8Be in the reaction $^{12}\text{C}(\bar{d},^6\text{Li})$ at $E_d=51.7$ MeV. The results of the DWBA calculation with a finite-range interaction are in agreement with the experimental cross section and analyzing power. In the DWBA analysis, the spin-orbit term of the deuteron optical potential is significant but this term of the lithium optical potential had the minor effect on the angular distributions and the vector analyzing power. The extracted absolute alpha-spectroscopic factor for the ground state of ^8Be is in agreement with the theoretical value. (6 refs.)

112228 Vector and tensor analyzing powers for $(d,^6\text{Li})$ on ^{12}C . Y. Tagishi, M. Ishikawa, H. Iida, T. Sugiyama, K. Hashimoto, M. Takei (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.502-6. Differential cross sections, vector analyzing power (iT_{11}) and tensor analyzing powers (T_{20} , T_{21} and T_{22}) are measured for the reaction $^{12}\text{C}(d,^6\text{Li})^8\text{Be(g.s.)}$ at deuteron energies 18 and 22 MeV. The zero-range distorted-wave Born approximation calculations have been performed on the present data. Angular distributions of cross section and vector analyzing power are fairly well reproduced by these simple calculations; however, the calculations predicted very small tensor analyzing powers T_{20} , T_{21} and T_{22} . (3 refs.)

112229 Proton-neutron correlation in the deuteron breakup at 56 MeV and prior-form DWBA analysis. N. Matsuoka, K. Hatanaka, T. Saito, T. Itahashi, K. Hosono, A. Shimizu, M. Kondo (Res. Center for Nuclear Phys., Osaka Univ., Osaka, Japan), F. Ohtani, O. Cynshi. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.527-40. Proton-neutron angular correlations in the ^{12}C , ^{51}V and $^{118}\text{Sn}(d,pn)$ reactions have been measured at 56 MeV to investigate the deuteron breakup process. The elastic breakup which leaves the target nucleus in its ground state dominates the coincident spectra. The experimental data have been analyzed using the prior-form DWBA. For both nuclear and Coulomb breakup, sufficient convergence of the calculations is obtained by including the pn angular momenta up to $l=2$. For the nuclear breakup calculations, the $l=0$ and 2 contributions dominate the cross sections. For the Coulomb breakup the $l=1$ contribution is predominant. The DWBA calculations reproduce the experimental data in the angular region where the protons are emitted on the side of the beam opposite to the neutrons. On the other hand the calculations overestimate the breakup cross sections by a factor of 2 to 10 in the angular region where the protons are emitted on the same side of the beam as the neutrons. The disagreement may be due to the insufficient treatment of the final-state distorted wave in the prior-form DWBA. (18 refs.)

112230 Three-body coupled-channel study of projectile breakup effects in deuteron, ^6Li and ^{12}C induced reactions. M. Kamimura (Dept. of Phys., Kyushu Univ., Fukuoka, Japan), M. Yahiro, Y. Iseri, Y. Sakuragi, M. Nakano, Y. Fukushima. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.558-80. Method of coupled discretized continuum channels is employed for taking into account the projectile-breakup continuum states in the framework of the three-body model. Analyses are performed of the multi-step breakup processes in the $^{58}\text{Ni}(d,d')^{58}\text{Ni}$ reaction at $E_i=80$ MeV and of the p -n angular correlations for the $^{12}\text{C}(d,pn)$ and $^{51}\text{V}(d,pn)$ reactions at $E_d=56$ MeV. The ^6Li projectile breakup effect on the elastic scattering from ^{28}Si at $E_{\text{lab}}=99$ MeV and from ^{40}Ca at $E_{\text{lab}}=156$ MeV are investigated. Breakup into the α -d resonant and non-resonant states are investigated. The ^{12}C excitation and breakup effect on the elastic and inelastic ^{12}C - ^{12}C scattering is studied for $E_{\text{lab}}=140\sim 300$ MeV. The dynamical polarization potentials due to the breakup (excitation) of the ^6Li and ^{12}C projectiles are discussed. (29 refs.)

- 112231 Investigation of adiabatic approximation of projectile-breakup effect on the elastic scattering and the projectile-breakup reactions.** M.Yahiro (Shimonoseki Univ. of Fisheries, Shimonoseki, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.617-20
Validity of adiabatic approximation is investigated in d- and ^6Li -induced reactions. The approximation is good for both the elastic scattering and the breakup reaction at the high incident energy. At the low incident energy the approximation is applicable only to the elastic scattering and poor for the breakup reaction. A modification of the approximation is discussed. (4 refs.)
- 112232 Deuteron projectile breakup on ^{28}Si at $E_d=17.85$ MeV.** C.A.Fields, R.J.Peterson, R.S.Raymond, J.L.Ullmann (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA), R.J.DeMeijer, E.H.L.Aarts, M.B.Greenfield. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.621-5
Deuteron breakup on ^{28}Si has been studied at 17.85 MeV using both singles and p-n coincidence techniques. Angular correlation data were obtained between 144° and -144° for protons and between 120° and -120° for neutrons. These results allow the separation of the breakup reaction into elastic, inelastic, and absorptive parts, and the determination of the contribution of each part to the reaction cross-section. 25.60 ^3He - AND ^4He -INDUCED REACTIONS AND SCATTERING

- 112233 Two-steps analysis of alpha emission in $^{25}\text{Mg}(^3\text{He},\alpha)$ reaction.** F.Shahin, R.Bonetti (Phys. Dept., Mansoura Univ., Mansoura, Egypt). *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.1, p.61-3 (1983).
Recent results on ^3He induced reactions have shown the importance of statistical multi-step compound emission. This process can explain the largely differing Γ -values extracted from the fluctuating excitation functions. Recently the Ericson's autocorrelation function $C(E)$ was generalized to cover the case in which many stages with different Γ -values contribute to the reaction. Analyses have been made by means of the generalized autocorrelation function on the $^{25}\text{Mg}(^3\text{He},\alpha)$ reaction in the ^3He energy range from 8.05 to 20.425 MeV. The spectral density method was also applied to the same data and gave consistent results. (9 refs.)
- 112234 The α - ^7Li and α - ^{12}C elastic scattering at $E_\alpha=5$, and 6, MeV.** C.W.Wang, G.C.Kiang, L.L.Kiang, G.C.Jon, E.K.Lin (Inst. of Phys., Acad. Sinica, Taipei, Taiwan). *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.239 (Dec. 1982). [received: Sept. 1983]
The differential cross section of α - ^7Li and α - ^{12}C elastic scattering have been measured at energies $E_\alpha=5$ and 6 MeV. The results are interpreted by using real phase-shift analysis. The real phase-shifts interpreted the α - ^{12}C scattering data very well at the energies investigated. The α - ^7Li scattering data are also fitted quite well by the real phase-shifts. The states at $E_\alpha=0.4776$ MeV in ^7Li and at $E_\alpha=4.439$ MeV in ^{12}C play little role in this experiment. For scattering angles $\theta_{\text{CM}} > 150^\circ$, the results show very prominent glory scattering and fit to the glory model very well. (no refs.)
- 112235 Nuclear g-factor of the $17/2^+$ isomeric state in ^{63}Cu .** N.Kawamura, K.Iura, Y.Kimura, K.Katsube, M.Kikuchi, S.Ali, S.Hayashibe, T.Ishimatsu (Dept. of Phys., Tohoku Univ., Sendai, Japan), M.Fujioka, K.Abe. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.533-40 (26 Sept. 1983).
The nuclear g-factor of the 4498 keV $17/2^+$ isomeric state in ^{63}Cu was measured with the in-beam perturbed angular distribution method, through the $^{62}\text{Ni}(\alpha,p2n\gamma)^{63}\text{Cu}$ reaction, to be $g_{\text{exp}}=0.184 \pm 0.012$. This value is in good agreement with a semiempirical g-factor for the three quasiparticle configuration $[\pi 2p_{3/2}(\nu 1f_{7/2}, 1g_{9/2})]17/2^+$ calculated using the experimental single-particle g-factors of neighbouring nuclei. At the same time the internal magnetic field at the Cu nuclei in Ni metal was obtained to be $B_{\text{int}} = -46.6 \pm 1.3$ kG. (13 refs.)
- 112236 Transition probabilities between two-quasiparticle configurations in $^{176,172}\text{Yb}$ and ^{182}W .** L.K.Kostov, W.Andrejschiff (Inst. of Nuclear Res. & Nuclear Energy, Bulgarian Acad. of Sci., Sofia, Bulgaria), H.Rotter, H.Prade, F.Stary. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.541-56 (26 Sept. 1983).
Applying the generalized centroid-shift method in (α,n) reactions, the following half-lives of 2 q.p. states have been measured: $T_{1/2}(1375.8 \text{ keV})=0.20 \pm 0.07 \text{ ns}$, $T_{1/2}(1640.8 \text{ keV})=0.5 \pm 0.2 \text{ ns}$, $T_{1/2}(2689.5 \text{ keV})=0.7 \pm 0.1 \text{ ns}$, $T_{1/2}(2189.9 \text{ keV})=2.2 \pm 0.3 \text{ ns}$, $T_{1/2}(1851.5 \text{ keV}) < 0.2 \text{ ns}$, $T_{1/2}(170 \text{ Yb})$; $T_{1/2}(100.1 \text{ keV})=1.4 \pm 0.2 \text{ ns}$, $T_{1/2}(1809.7 \text{ keV})=0.25 \pm 0.10 \text{ ns}$, $T_{1/2}(1829.5 \text{ keV})=0.25 \pm 0.10 \text{ ns}$, $T_{1/2}(1756.8 \text{ keV}) < 0.5 \text{ ns}$ (^{182}W). The experimental E1, M1 and E2 transition rates are compared to calculations within the Nilsson-plus-pairing model. The band-head $K^\pi=4^-$ of a semi-aligned band in ^{172}Yb appears as a deformation-aligned 2 q.p. configuration. The E2 transition rates indicate configuration mixing between the 2 q.p. $K^\pi=4^-$, 5^- and 6^- states in ^{182}W . (21 refs.)

- 112237 Contributions of various particle-particle coincidences to the inclusive $(^3\text{He},p)$ spectra at $\theta_p=10^\circ$ on ^{12}C , ^{28}Si and ^{58}Ni at $E=52$ MeV.** E.H.L.Aarts, R.A.R.L.Malfliet, R.J.de Meijer, S.Y.van der Werf (Kernfys. Versneller Inst., Rijksuniv. Groningen, Groningen, Netherlands). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.581-9
The authors present information on the inclusive spectra and identify the processes that contribute to the inclusive proton spectrum at $\theta_p=10^\circ$. In addition they present a simple model that relates the dominant coincidence yields to the total inclusive cross sections. (3 refs.)

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

- 112238 Elastic scattering of ^7Li projectiles in the energy range of 20 to 34 MeV.** S.A.E.Khallaf (Dept. of Phys., Faculty of Sci., Aswan, Egypt). *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.2, p.126-8 (1983).
The author calculates the differential cross sections for ^7Li elastic scattering from ^{90}Zr , ^{48}Ca , ^{16}O and ^{12}C at incident energies of 20 to 34 MeV using the Watanabe folding model and studies the applicability of this model for ^7Li elastic scattering. The potentials of ^7Li ions are revealed by Taylor expansions of alpha and triton cluster potentials. The resulting differential cross sections are compared with the predicted cross sections using phenomenological potentials of ^7Li ions. (21 refs.)
- 112239 Strange encounters of the π kind.** D.W.Mingay. *Nucl. Active (S. Africa)*, no.29, p.5-9 (July 1983).
The Rutherford scattering cross section is the best established and tested of all theoretical predictions of nuclear reaction probabilities. An anomalously high yield, a factor greater than two larger than predicted, is seen when scattering is observed at an exact 180° angle for surface interactions. An investigation of this effect using a nitrogen ion beam together with a probable explanation of its cause are discussed. (10 refs.)
- 112240 Calculation of the imaginary part of the heavy ion potential.** G.Pollarolo, R.A.Brogia, A.Winther (The Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark). *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.369-89 (19 Sept. 1983).
The paper contains a numerical evaluation of the expressions for the absorptive potential in heavy ion reactions given earlier. With a standard folding expression for the real part of the ion-ion potential general good agreement is found with experimental data for the angular distributions of elastic and inelastic scattering. Special interest is attached to the case of $^{16}\text{O}+^{28}\text{Si}$ where the calculated imaginary potential is very small at low bombarding energies. (10 refs.)
- 112241 The role of particle transfer in large-angle scattering of 1p-shell nuclei.** J.Sromicki, M.Hugi, J.Lang, R.Muller, E.Ungriht (Lab. fur Kernphys., ETH, Zurich, Switzerland), L.Jarczyk, B.Kamys, A.Magiera, Z.Rudy, A.Strzalkowski, B.Zebik. *Nucl. Phys. A (Netherlands)*, vol.A406, no.2, p.390-412 (19 Sept. 1983).
The scattering of different 1p shell heavy ions on nuclei of the same species has been measured in the whole angular range up to 174° . Various pairs of interacting nuclei have been selected according to the different complexities of their properties which can influence the scattering through higher-order processes to different degrees. In general, the observed rise of the cross section in the backward region is satisfactorily described as a single-step transfer reaction. Second-order processes and compound-nucleus contributions are of no practical importance for the explanation of the elastic scattering data. The performed analysis, however, leaves some features in the experimental angular distributions not fully and satisfactorily understood. (51 refs.)
- 112242 Unified description of statistical excitations, deformations and charge transfer in a dynamical theory of deep-inelastic heavy-ion collisions.** P.Frobrich, B.Strack (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany), M.Durand. *Nucl. Phys. A (Netherlands)*, vol.A406, no.3, p.557-73 (26 Sept. 1983).
In order to describe dissipative heavy-ion collisions a multi-dimensional Fokker-Planck equation including relative motion, quadrupole deformations and

charge transfer is solved within the quasilinear approximation (moment expansion up to second order). The authors aim at a unified description of Coulomb-like, focusing and orbiting systems by using a universal parametrization. Calculations for $^{136}\text{Xe} + ^{209}\text{Bi}$ at $E_{\text{lab}} = 940, 1130$ and 1422 MeV are compared with the experimental data. (30 refs.)

112243 Microscopic study of heavy-particle transfer reactions: the ($^{16}\text{O}, \alpha$) reactions on ^{16}O and ^{28}Si . K.Langanke, R.Stademann, A.Weiguny (Inst. für Theoretische Phys., Univ. Münster, Münster, Germany). *Nucl. Phys. A (Netherlands)*, vol. A406, no.3, p.574-90 (26 Sept. 1983). The transfer reactions $^{28}\text{Si}(^{16}\text{O}, \alpha)^{40}\text{Ca}$ and $^{16}\text{O}(^{16}\text{O}, \alpha)^{28}\text{Si}$ have been studied within the framework of the two-channel generator coordinate method. The geometry of the reactions has been discussed in terms of the cross-channel overlap kernels of the generating functions. A clear connection between maxima in the reaction rate and entrance channel resonances has been established. A two-step reaction mechanism involving quasimolecular resonances of inelastic ^{16}O - ^{16}O channels is discussed as a possible explanation for narrow structures seen in the $^{16}\text{O}(^{16}\text{O}, \alpha)^{28}\text{Si}$ reaction cross section. (24 refs.)

112244 High-spin states in ^{222}Th . D.Ward, G.D.Dracoulis, J.R.Leigh, R.J.Charity, D.J.Hinde, J.O.Newton (Dept. of Nuclear Phys., Australian Nat. Univ., Canberra, Australia). *Nucl. Phys. A (Netherlands)*, vol. A406, no.3, p.591-612 (26 Sept. 1983). Levels to spin 16^+ in the ground band and 17^- in the octupole band in ^{222}Th have been identified using the reaction $^{208}\text{Pb}(^{16}\text{O}, 4n)^{222}\text{Th}$ at 93 MeV. To suppress intense γ -ray background from fission a residue detector was built and operated in coincidence with the Ge(Li) and NaI(Tl) detectors. The apparent moment of inertia in the ground-state rotational band rises very rapidly with increasing spin, however, no indications of backbending were observed. The octupole band at low spin has an aligned angular momentum $J \approx 3\hbar$ relative to the ground-state band. Strong crossband E1 transitions competed with collective E2 transitions within each band. Analysis showed that the ratios $B(E1)/B(E2)$ were within experimental uncertainty independent of both the spin and parity of the parent state. The average γ -ray multiplicity per cascade was measured for ^{222}Th . The results were in reasonable agreement with the computer code ORNL-ALICE. (44 refs.)

112245 Gross structure resonance at 24.3 MeV in $^{12}\text{C} + ^{12}\text{C}(2^+)$. O.Tanimura, R.Wolf (Inst. für Theoretische Phys., Univ. Giessen, Giessen, Germany). *Phys. Lett. B (Netherlands)*, vol. 128B, no.6, p.375-80 (8 Sept. 1983). The 24.3 MeV peak observed in the integrated cross sections in the $^{12}\text{C} + ^{12}\text{C}(2^+)$ inelastic scattering is attributed to a $J^\pi = 16^+$ resonance; this assignment is based on a simultaneous coupled channel analysis of the angular distributions of the elastic and inelastic cross sections. (22 refs.)

112246 Atomic charge states of residual nuclei from compound nucleus reactions. W.S.Freeman, H.Ernst, D.F.Geesaman, W.Henning, T.J.Humanic, W.Kuhn, J.P.Schiffer, B.Zeidman (Argonne Nat. Lab., Argonne, IL, USA), F.W.Prosser. *Phys. Rev. C (USA)*, vol. 28, no.2, p.919-20 (Aug. 1983). The average energy-to-charge state ratios of evaporation residues from fusion of Ni+Sn are measured using an electrostatic deflector combined with ΔE - E particle identification. The deduced average atomic charge states are 5 to 13 units higher than the equilibrium values expected from stripping in the target, suggesting that nuclear decays outside the target foil play an important role. The importance of internal conversion in determining these anomalously high charge states is discussed. (8 refs.)

112247 Coulomb excitation of ^{189}Os . S.Jha (Inst. de Engenharia Nuclear, Rio de Janeiro, Brazil), W.A.Seale, R.V.Ribas, E.W.Cybulska, M.N.Rao, J.D.Rogers, G.M.Julian. *Phys. Rev. C (USA)*, vol. 28, no.2, p.921-2 (Aug. 1983). Coulomb excitation studies have been performed on an enriched ^{189}Os target with a 56 MeV ^{16}O beam. Gamma rays were measured in coincidence with the backscattered ^{16}O ions. Rotational bands built on $3/2^-$ [512], $1/2^-$ [510] up to spin $11/2$ have been identified. (5 refs.)

112248 Nucleus-nucleus potential at close contact from fusion at 'high' energies. J.Gomez del Campo, G.R.Satchler (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Phys. Rev. C (USA)*, vol. 28, no.2, p.952-4 (Aug. 1983). The authors compile the results of analyses, based upon the potential barrier penetration model, of fusion cross-section measurements at 'high' energies (those on the high-energy side of the bend in the σ_{fus} vs. $1/E_{\text{c.m.}}$ plot). A systematic correlation between the critical radius R_{cr} and the potential V_{cr} at that radius is demonstrated. These results provide information about the nucleus-nucleus potential at smaller distances than is usually available from scattering and 'low' energy fusion measurements. For some systems, nuclear potential depths of as much as -110 MeV are implied. (29 refs.)

112249 Charge and mass exchange in ^{56}Fe -induced reactions at 8.3 MeV/nucleon. H.Breuer, A.C.Mignerey (Univ. of Maryland, College Park, MD, USA), V.E.Viola, K.L.Wolf, J.R.Birkelund, D.Hilscher, J.R.Huizenga, W.U.Schroder, W.W.Wilcke. *Phys. Rev. C (USA)*, vol. 28, no.3, p.1080-103 (Sept. 1983). Projectilelike fragments from reactions of 465-MeV ^{56}Fe projectiles with targets of ^{56}Fe , ^{185}Ho , ^{209}Bi , and ^{238}U have been measured as a function of energy loss, and neutron and proton number. The mass and charge of each fragment were uniquely determined with discrete resolution. Data were analyzed as a function of energy loss by fitting a two-dimensional Gaussian function to the neutron-proton distributions. The fit parameters provide a convenient basis for comparison with theoretical predictions. In addition, centroids and variances derived from more detailed one-dimensional Gaussian fits to isobaric charge distributions are presented. Results are given for measured data as well as for the primary fragment distributions after correction for the dominant neutron evaporation. The centroid data show that in the asymmetric reactions proton transfer from projectile to target nucleus is preferred while the average fragment neutron number is largely preserved. This produces a charge equilibration process which is dependent on energy loss within the combined systems. The neutron and proton variances indicate an early dominant neutron flow followed by a constant relative neutron and proton exchange rate at energy losses above about 30 MeV. The degree of correlation of the neutron-proton distributions increases with energy loss and is found to be strongly related to the potential energy surface. Consistently observed negative correlation coefficients at low energy losses suggest the possible importance of processes other than particle exchange in the early stages of the interaction. Variances for constant N , Z , and A are found to saturate at energy losses and with magnitudes dependent on the target nucleus. (45 refs.)

112250 Sensitivity of phase shifts to the optical potentials in heavy ion scattering. C.S.Shastry, Y.K.Gambhir (Univ. Louis Pasteur de Strasbourg, Strasbourg, France). *Phys. Rev. C (USA)*, vol. 28, no.3, p.1109-18 (Sept. 1983). The authors formulate a procedure implicit in the Jost function formulation of the potential scattering in order to investigate the potential ambiguities occurring in two body scattering by a complex potential. The connection between this method and the distorted-wave Born approximation formalism is pointed out. They apply this method to study the potential ambiguities known to exist in heavy ion scattering by taking $^{18}\text{O} + ^{58}\text{Ni}$, $\alpha + ^{27}\text{Al}$, and $^6\text{Li} + ^{12}\text{C}$ for typical illustrative calculations. The calculations trace the origin of the potential ambiguities to the Coulomb potential and sizes and masses of the colliding nuclei. The regions of configuration space which contribute strongly to the partial wave S matrix are illustrated graphically. (17 refs.)

112251 Viscous fluid dynamical calculation of the reaction $^{12}\text{C}(85 \text{ MeV/nucleon}) + ^{197}\text{Au}$. G.Buchwald, G.Graebner, J.Theis, J.A.Maruhn, W.Greiner (Inst. für Theoretische Phys., J.W. Goethe Univ. Frankfurt, Frankfurt am Main, Germany), H.Stocker. *Phys. Rev. C (USA)*, vol. 28, no.3, p.1119-22 (Sept. 1983). Proton spectra have been calculated for the reaction $^{12}\text{C}(85 \text{ MeV/nucleon}) + ^{197}\text{Au}$ using a three-dimensional hydrodynamical model with viscosity and thermal conductivity and final thermal breakup. The theoretical results are compared to recent data. It is shown that the predicted flow effects are not observable as a result of the impact parameter averaging inherent in the inclusive proton spectra. In contrast, angular distributions of medium mass nuclei ($A > 3$) in nearly central collisions can provide signatures for flow effects. (20 refs.)

112252 Pion absorption versus compression effects in relativistic nucleus-nucleus collisions. R.Malfliet (Kernfys. Versneller Inst., Groningen, Netherlands), B.Schurmann. *Phys. Rev. C (USA)*, vol. 28, no.3, p.1136-9 (Sept. 1983). Inclusive particle spectra are calculated based on a multiple-collision model which fits the negative-pion multiplicity for central collisions using two different prescriptions. In one case pion absorption and in the other case compressional degrees of freedom are considered to effect this. From a comparison with measured proton, deuteron, triton, and negative pion inclusive spectra for the reaction Ar on KCl at 800 MeV/nucleon, no conclusive evidence for strong compression effects can be extracted. (15 refs.)

112253 ^6Li - ^6Li and ^7Li - ^7Li elastic scattering from 2.0 to 5.5 MeV. E.Norbeck, P.T.Wu, C.R.Chen, R.R.Carson (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA). *Phys. Rev. C (USA)*, vol. 28, no.3, p.1140-7 (Sept. 1983). Elastic scattering of ^6Li from ^6Li and ^7Li from ^7Li has been studied for beam energies from 2.0 to 5.5 MeV using very thin films of isotopically separated LiF as targets. A double-folding model optical potential provided a good fit for $^7\text{Li} + ^7\text{Li}$ for the entire energy range, and for $^6\text{Li} + ^6\text{Li}$ for energies low enough that the breakup $^6\text{Li} \rightarrow \alpha + d$ could not occur. For higher energies, the real part of the $^6\text{Li} + ^6\text{Li}$ potential falls off rapidly with energy so that by 5.5 MeV the potential well required to fit the data is only about 40% as deep as is predicted by the folding model. (18 refs.)

112254 Fusion and peripheral processes in the collisions of $^{20}\text{Ne} + ^{20}\text{Ne}$ and $^{20}\text{Ne} + ^{16}\text{O}$. D.Shapira, D.DiGregorio, J.Gomez del Campo, R.A.Dayras, J.L.C.Ford, Jr., A.H.Snell, P.H.Stelson, R.G.Stokstad (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), F.Pougeon. *Phys. Rev. C (USA)*, vol. 28, no.3, p.1148-60 (Sept. 1983). Reaction products from the bombardment of ^{20}Ne and ^{16}O gas targets with ^{20}Ne beams have been measured at five laboratory energies between 70 and 160 MeV. Fusion, deep inelastic, and quasielastic processes were studied. Large deep inelastic yields ($\sigma_{\text{DI}} \geq 600$ mb) with average Q values of -50 MeV are present at the highest energy. Analysis of the fusion cross sections for $^{20}\text{Ne} + ^{16}\text{O}$ suggests that the maximum angular momentum in ^{36}Ar populated via this entrance channel may be as low as $29 \pm 2\hbar$. (42 refs.)

112255 Penetration of the centrifugal barrier in the fusion of ^{16}O with heavy targets. R.Vandenbosch, B.B.Back, S.Gil, A.Lazzarini, A.Ray (Nuclear Phys. Lab., Univ. of Washington, Seattle, WA, USA). *Phys. Rev. C (USA)*, vol. 28, no.3, p.1161-6 (Sept. 1983). Gamma ray multiplicities and rotational band transition intensities have been measured for the $^{154}\text{Sm}(^{16}\text{O}, 4n)$ reaction for bombarding energies between 62.5 and 73.5 MeV. It is shown that centrifugal barrier penetration leads to a fairly broad spin distribution of the compound nucleus even at near-barrier energies. The results are discussed in terms of optical model absorption probabilities and parabolic barrier penetration probabilities. (20 refs.)

112256 Inclusive particle production at forward angles from collisions of light relativistic nuclei: nuclear fragments. L.Anderson, W.Bruckner, E.Moeller, S.Nagamiya, S.Nissen-Meyer, L.Schroeder, G.Shapiro, H.Steiner (Dept. of Phys., Univ. of California, Berkeley, CA, USA). *Phys. Rev. C (USA)*, vol. 28, no.3, p.1224-45 (Sept. 1983). The authors have measured the production of charged nuclear fragments in collisions of 1.05 GeV/nucleon and 2.1 GeV/nucleon proton, deuteron, alpha, and carbon projectiles as well as 0.4 GeV/nucleon alpha particles on targets of C, Cu, Pb, and H (from a CH_2 -C subtraction), using a double focusing spectrometer. They present single particle inclusive cross sections for the production of $Z=1$ and $Z=2$ fragments in the region $0.5 \leq (p/Z)_{\text{lab}} \leq 8.7$ GV/c and $0^\circ \leq \theta_{\text{lab}} \leq 12^\circ$. They discuss the relevance of the concept of limiting fragmentation to the data and point out possible uses of the data to study nuclear structure and particle production mechanisms. A detailed comparison is made with Glauber-type models and hard-scattering models as well as the coalescence model. (87 refs.)

112257 Inclusive particle production at forward angles from collisions of light relativistic nuclei: negative pions. E.Moeller, L.Anderson, W.Bruckner, S.Nagamiya, S.Nissen-Meyer, L.Schroeder, G.Shapiro, H.Steiner (Dept. of Phys., Univ. of California, Berkeley, CA, USA). *Phys. Rev. C (USA)*, vol. 28, no.3, p.1246-55 (Sept. 1983). The authors have measured single particle inclusive spectra of negative pions produced at angles from 0° to 12° (lab) in collision of 1.05 and 2.1 GeV/nucleon protons, deuterons, alpha particles, and carbon nuclei with targets of C, Cu, Pb, and H (from a CH_2 -C subtraction). Most of the pions are produced in the kinematical domains allowed in free nucleon-nucleon collisions but for alpha and carbon projectiles they have also observed pions whose energies range up to nearly twice the kinetic energy of a nucleon in the projectile. The results suggest that processes involving more than two colliding nucleons and/or high internal momentum components are involved in the production of these high energy pions. Comparison is made with several hypotheses of scaling including specific dynamical models, and some disagreement is observed. The authors present fits to the kinetic energy dependence of the data, and the target and projectile mass dependence. They also show transverse momentum distributions. (35 refs.)

- 112258 Pauli forbidden states and nucleus-nucleus potentials.** H.Friedrich, K.Langanke (W. K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA). *Phys. Rev. C (USA)*, vol.28, no.3, p.1385-8 (Sept. 1983). The authors discuss the tangible consequences of the existence of Pauli forbidden states of relative motion of two nuclei for the nucleus-nucleus interaction. The ranges of the influence of the Pauli forbidden states are tabulated for the systems ^{12}C , $^{12,13,14}\text{C}$, ^{14}C , ^{14}C , $^{12,14}\text{C}$, ^{16}O , ^{16}O , α , ^{40}Ca , and α - ^{40}Ca . (16 refs.)
- 112259 $^{16}\text{O}+^{28}\text{Si}$ elastic scattering near the barrier.** S.Kahana, J.Barrette, B.Berthier, E.Chavez, A.Greiner, M.C.Mermaz (Dept. de Phys. Nucleaire/Basses Energies, CENS, Gif-sur-Yvette, France). *Phys. Rev. C (USA)*, vol.28, no.3, p.1393-5 (Sept. 1983). Elastic scattering angular distribution and 180° c.m. excitation function are rather well reproduced just above the Coulomb barrier by a heavy ion nuclear potential having a repulsive core at short distances and a very strong attractive behaviour at the nuclear surface. An important prediction of this potential, a precipitous drop in differential cross section at 180° , is verified experimentally. (15 refs.)
- 112260 Survey of low energy heavy ion reaction mechanisms.** A.Winther (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark). *Phys. Scr. (Sweden)*, vol.T5, p.84-90 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The author surveys the efforts that a group in Copenhagen has made in recent years in order to establish a firmer basis for the understanding of heavy ion reactions at low bombarding energies. The topics cover phenomena from the calculation of the absorptive potential and excitation of giant resonances to fusion and critical angular momentum for fission. (16 refs.)
- 112261 Heavy-ion reaction mechanisms studied with the spin spectrometer.** M.L.Halbert, J.H.Barker, J.R.Beene, R.L.Ferguson, D.C.Hensley, G.R.Young (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), F.A.Dilmanian, M.Jaaskelainen, H.Puchta, D.G.Sarantidis, R.Woodward. *Phys. Scr. (Sweden)*, vol.T5, p.91-7 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Experimental data and statistical-model calculations for xn and axn products of the reaction $^{20}\text{Ne}+^{140}\text{Nd}$ at 136 MeV are shown to be in generally good agreement, indicating that equilibrium processes are dominant. Preliminary results on the heavy-ion ejectiles from $^{159}\text{F}+^{159}\text{Tb}$ are presented. (21 refs.)
- 112262 Energy dependence of light particle emission from intermediate energy heavy ion collisions.** G.D.Westfall (Nat. Superconducting Cyclotron Lab., Michigan State Univ., East Lansing, MI, USA). *Phys. Scr. (Sweden)*, vol.T5, p.103-7 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). High energy nucleus-nucleus collisions can provide a unique method of studying nuclear matter at densities and excitations far from the normal ground state. In these collisions a source can be identified with a velocity intermediate between the projectile and target velocities as well as sources that can be associated with decay of excited projectile and target nuclei. The study of light particle spectra (p, d, t and alpha) associated with this intermediate source can provide information on the equation of state of nuclear matter. Results are presented for O and Ne induced reactions on heavy targets ranging in energy from 9 to 800 MeV/nucleon. Analysis of these light particle data in terms of a single moving source model leads to a consistent description of a system in thermodynamic and chemical equilibrium. Extracted d/p and t/p ratios are almost independent of incident energy while the alpha/proton ratio increases dramatically at low bombarding energies. (14 refs.)
- 112263 Dynamics of medium energy nuclear collisions.** H.Stocker (Dept. of Phys. & Astron., Michigan State Univ., East Lansing, MI, USA), G.Buchwald, L.P.Csernai, G.Graebner, P.R.Subramanian, J.Theis, J.A.Maruhn, W.Greiner. *Phys. Scr. (Sweden)*, vol.T5, p.108-13 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Recent theoretical attempts to study high energy heavy ion reactions are reviewed. Special emphasis is given to the description of the dynamical evolution and to the production of pions and light fragments in the collision. Evidence for a collective quasi-hydrodynamic flow behaviour of compressed nuclear matter is presented. The authors show that the pion yield is sensitive to the nuclear equation of state and to the viscosity in hot dense nuclear matter. A 4π exclusive flow analysis of intermediate energy nuclear collisions can be used to reveal the compressibility coefficient of nuclear matter. (31 refs.)
- 112264 The physics of heavy ion collisions at 100 MeV per nucleon.** H.Ryde (Dept. of Phys., Univ. of Lund, Lund, Sweden). *Phys. Scr. (Sweden)*, vol.T5, p.114-17 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Nuclear reactions induced by intermediate energy heavy ions are discussed. The observation of large nuclear surface transparency and of nuclear rainbow scattering in elastic scattering of ^{12}C ions is presented. The data obtained for projectile-like fragments are compared with corresponding results from collisions involving relativistic heavy ions. Finally, a model for the production of light particle spectra emitted in heavy ion reactions is suggested and compared with the experimental data. (9 refs.)
- 112265 The dynamics of heavy ion reactions at relativistic energies.** J.Knoll (Gesellschaft für Schwerionenforschung, Darmstadt, Germany). *Phys. Scr. (Sweden)*, vol.T5, p.118-23 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Some selected aspects of nuclear reactions at beam energies below a couple of GeV/nucleon are reviewed. The different dynamical regimes from the micro- and to the macro-dynamics and the late expansion stage are discussed and compared with respect to their implications on specific observable like inclusive data or global event observations. (17 refs.)
- 112266 Quarkochemistry of the heavy ion reactions.** T.S.Biro, J.Zimanyi (Central Res. Inst. for Phys., Budapest, Hungary). *Phys. Scr. (Sweden)*, vol.T5, p.124-9 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). A review of a hadrochemical and quarkochemical model of relativistic heavy ion reactions is presented. It is pointed out that the minimal bombarding energy necessary to create baryonic gluon plasma is about 6 GeV/nucleon. The signature of the quark matter is also investigated in the strange meson production. (14 refs.)
- 112267 Compression effects in relativistic nucleus-nucleus collisions.** R.Stock, R.Bock, R.Brockmann (Gesellschaft für Schwerionenforschung, Darmstadt, Germany), A.Dacal, J.W.Harris, M.Maier, M.E.Ortiz, H.G.Pugh, R.E.Renfordt, A.Sandoval, L.S.Schroeder, H.Stroebele, K.L.Wolf. *Phys. Scr. (Sweden)*, vol.T5, p.130-5 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The negative pion multiplicity is measured for inelastic and central collisions of ^{40}Ar with KCl at eight energies from 0.36 to 1.8 GeV/nucleon and for ^{40}He and ^{40}Ar on BaF_2 at 977 and 772 MeV/nucleon, respectively. A systematic discrepancy in central collision data with a cascade model calculation which fits proton- and pion-nucleus cross sections but omits potential energy effects is used to derive the energy going into bulk compression of the system. A value of the compressibility constant of $K=240$ MeV is extracted in a parabolic form of the nuclear matter equation of state. (21 refs.)
- 112268 Pions produced in heavy reactions far below the free nucleon-nucleon scattering threshold.** B.Jakobsson (Dept. of Phys., Univ. of Lund, Lund, Sweden). *Phys. Scr. (Sweden)*, vol.T5, p.207-12 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Experimental data on pion production in heavy ion reactions at energies below 100 A MeV is presented. The inclusive spectra of π^+ and π^- from reactions at 50-100 A MeV are in general well reproduced by a first-nucleon-nucleon scattering mechanism when diffused internal momentum distributions, Pauli Blocking, and reabsorption is considered. (20 refs.)
- 112269 Multifragmentation of big nuclei.** D.H.E.Gross (Hahn-Meitner-Inst. für Kernforschung, Berlin, Germany). *Phys. Scr. (Sweden)*, vol.T5, p.213-16 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). Heavy target nuclei split into many fragments when bombarded by protons or heavy ions at very high energies ($E_p > 10$ GeV). A statistical model is presented, which calculates the relative phase-space available for the various multifragment decay channels. It is shown that the Coulomb-interaction between the fragments is crucial. Including it by a self-consistent mean field method leads to a significant enhancement of the survival of the most heavy fragments and a strong suppression of the probability for splitting into many medium fragments. At a temperature of ~ 5 MeV an U-shaped mass-yield curve results from the model calculations for most of the heavy targets, whereas they show a clear fission peak for U-targets. Over the whole fragment-mass region the experimental mass-yield distributions for limiting fragmentation can thus be reproduced. Further investigations and refinements of the model are needed before a final judgement about the importance of the multifragment phase-space relative to dynamical effects is possible. (10 refs.)
- 112270 Analysis of the evaporation-corrected mass and charge distributions in the Ar+Mo reactions.** W.Bohne, P.Frobrich, K.Grabisch, K.Hartmann, H.Lehr, H.Morgenstern, W.Stoffler (Hahn-Meitner-Inst. für Kernforschung, Berlin, Germany). *Z. Phys. A (Germany)*, vol.313, no.1-2, p.19-29 (1983). Partly and strongly damped fragments from the reactions $^{36}\text{Ar}+^{92}\text{Mo}$ and $^{40}\text{Ar}+^{100}\text{Mo}$ are measured at $E_{\text{lab}}=270$ MeV. The extracted mass and charge distributions are carefully corrected for γ , n, p and α particle evaporation. The resulting primary distributions are analysed with theoretical models which assume statistical neutron and proton exchange on the potential energy surface of the projectile-target system. Dynamical deformation effects in the framework of the surface friction model are included. (26 refs.)
- 112271 Light charged particle emission and fission in $^{238}\text{U}+^{238}\text{U}$ collisions at 1740 MeV.** M.Kaplan, D.J.Moses, D.O.Eriksen, M.Kildir, D.R.G.Logan (Dept. of Chem., Carnegie-Mellon Univ., Pittsburgh, PA, USA), M.S.Zisman, R.J.McDonald. *Z. Phys. A (Germany)*, vol.313, no.1-2, p.31-7 (1983). Inclusive ^4He and ^3He energy spectra and heavy fragment coincidence correlations have been measured for reactions of 7.31 MeV/u ^{238}U with ^{238}U and ^{197}Au targets. The H/He production cross sections are in the range 15-26 mb, and their emission spectra are very similar for the two systems. The observed strong kinematic shifts with angle are reproduced in shape and magnitude by Monte Carlo simulations of particle evaporation from projectile-like and target-like fragments, indicating competition between charged particle emission and sequential fission. No evidence is found for high energy charged particle emission associated with ultra-high Z composite systems. Heavy fragment measurements indicate an abundance of quasielastic and deeply inelastic reaction fragments, as well as sequential fission of target and projectile nuclei. The surprisingly high survival probabilities of high-Z fragments imply a preponderance of very soft collisions in these very-heavy-ion reactions, at least at energies not very far over the Coulomb barrier. (23 refs.)
- 112272 Formation and decay of the compound nucleus studied in the reaction $^{20}\text{Ne}+^{27}\text{Al}$.** H.Morgenstern, W.Bohne, K.Grabisch, H.Lehr, W.Stoffler (Hahn-Meitner-Inst. für Kernforschung, Berlin, Germany). *Z. Phys. A (Germany)*, vol.313, no.1-2, p.39-49 (1983). Energy and velocity spectra, angular and mass distributions have been measured for evaporation residue products of the $^{20,22}\text{Ne}+^{27}\text{Al}$ system in the energy range of $E_L(^{20}\text{Ne})=51$ to 395 MeV and in the angular range $\theta=2^\circ$ and 30° . Calculations with simple assumptions of the velocity and angular distributions of the evaporation residues are presented and compared to the data. The structure seen in the mass distributions, a competition between α -particle and nucleon evaporation in the deexcitation of the compound nucleus, is described well by calculations with the computer code CASCADE. The evaporation residues exhibit mass distributions varying systematically as a function of the excitation energy. The excitation function of the evaporation residue cross section is compared with theoretical models. At higher incident energies contributions of incomplete momentum transfer (incomplete fusion) are observed. A limitation for complete compound nucleus formation with following light particle evaporation is found. (33 refs.)
- 112273 On the fusion dynamics of $^{40}\text{Ar}+^{40}\text{Ca}$ -fusion-fission and fusion-evaporation.** J.Carter, C.Brendel, A.Richter, G.Schrieder (Inst. für Kernphys., Tech. Hochschule, Darmstadt, Germany), H.Feldmeier, W.Bohne, K.Grabisch, H.Lehr, H.Morgenstern. *Z. Phys. A (Germany)*, vol.313, no.1-2, p.57-67 (1983). Evaporation residue measurements have been made for the $^{40}\text{Ar}+^{40}\text{Ca}$ system at high incident energies, $E_{\text{lab}}=161, 190, 236$ and 273 MeV. A dynamical description of the fusion process is presented, where in a trajectory model both rotational and neck degrees-of-freedom are included. Using this model maximum l-values for fusion are determined and at high incident energies are found to be significantly lower than those found when using the more usual one-dimensional effective nucleus-nucleus potential. The fusion cross sections minus the fission component yields evaporation residue cross sections that are in good agreement with the data. Also, mass distributions of the evaporation residues compare well with statistical-decay model predictions. A comparison is made with the similarly mass-symmetric $^{40}\text{Ca}+^{40}\text{Ca}$ system. (31 refs.)
- 112274 Probing phase transitions via energetic nuclear collisions.** B.Lukacs, L.P.Csernai. **Report KFKI-1983-76**, Hungarian Acad. Sci., Budapest (1983), 16 pp. The possible effects of the nucleon-quark phase transition on the dynamics of heavy ion collisions are discussed. It is shown that the formation of the quark phase can be expected at recent experiments. Nevertheless, the compressibility of the two-phase mixture remains relatively low, thus the quark phase remains limited in both space and time, and the observables are not strongly affected. (20 refs.)

112275 The mechanism of the ($^6\text{Li},p$) reaction on light nuclei at $E_L=28$ MeV. D.L.Watson, M.J.Smithson (Dept. of Phys., Univ. of Bradford, Bradford, England), H.T.Fortune.
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.507-11

Angular distributions for the ($^6\text{Li},p$) reaction on ^{12}C and ^{13}C are reported. Some of these distributions are forward peaked, indicative of a direct reaction; however, the magnitude of the backward angle cross section suggests that other processes such as compound nucleus and multistep reactions may be involved. The overall magnitude of the cross-section for many of the distributions can be reproduced by Hauser-Feshbach calculations and the gross features of the distribution for the ground state of ^{17}O have been reproduced by an incoherent sum of a compound nucleus contribution with a direct five nucleon cluster contribution, and also by a sequential transfer of $^{12}\text{C}(^6\text{Li},d)(d,p)^{17}\text{O}$. It is considered that at 28 MeV the ($^6\text{Li},p$) reaction mechanism is a complex mixture of several processes and that the reaction must be carried out at higher energies if it is to be useful as a spectroscopic tool. (6 refs.)

112276 Projectile excitation and structure effects in polarized ^6Li scattering. H.Nishioka (Dept. of Phys., Univ. of Surrey, Guildford, England).
Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.600-9

The surprisingly large magnitude and opposite signs of the measured vector analysing powers of ^6Li and ^7Li elastic scattering from ^{58}Ni at $E_{\text{cm}}=20$ MeV are nicely reproduced by coupled-channel calculations including projectile excitation channels. The mechanism for producing an effective spin-orbit interaction between nuclei from projectile excitation is quite general and is applicable to other scatterings. The tensor analysing power of ^6Li scattering is found to be sensitive to the projectile surface structure. (20 refs.)

112277 Polarization in single-nucleon transfer reactions with ^{13}C and ^{11}B ions. N.Takahashi, R.Caplar, R.Wolski, H.Ho, E.Steffens, K.Busek, G.-Y.Fan, P.Wurm, N.Kato, A.Weller (Max-Planck-Inst. für Kernphys., Heidelberg, Germany).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.831-5

Single nucleon transfer reactions (^{13}C , ^{12}B) on the ^{27}Al , ^{nat}Cu and ^{nat}Mo targets and (^{11}B , ^{12}B) on the ^{nat}Cu target were studied at 70 MeV and 60 MeV, respectively. Energy spectra and polarization of $^{12}\text{B}_{\text{gs}}$ were measured at laboratory angles of 20° and 30° . Large negative polarization is observed for the (^{13}C , ^{12}B) reactions on the ^{27}Al and ^{nat}Cu targets at the largest kinetic energy of ^{12}B . Polarization tends to zero toward the smaller kinetic energy corresponding to the Coulomb energy. Other reactions exhibit polarization vanishingly small at the largest kinetic energy and at the Coulomb energy. Polarization is negative in sign but small in the middle of the ^{12}B kinetic energy axes. The difference in the behaviour of polarization reflects contributions of different reaction regimes. (11 refs.)

112278 Polarization of products ^{12}B in ^{14}N -induced reactions. K.H.Tanaka, K.Asahi, Y.Nojiri, T.Minamisono, N.Takahashi (Coll. of General Education, Osaka Univ., Toyonaka, Japan).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.836-40

Polarization of $^{12}\text{B}_{\text{gs}}$ ($I^\pi=1^+$, β^- decay to $^{12}\text{C}_{\text{gs}}$, $T_{1/2}=20.3$ ms) has been studied systematically at 120 MeV for two-nucleon transfer (^{14}N , ^{12}B) reactions on the ^{27}Al , ^{nat}Cu , ^{100}Mo and ^{232}Th targets. In the region near the largest kinetic energy of products, ^{12}B polarization is negative for the ^{nat}Cu , ^{100}Mo and ^{232}Th targets at angles around and forward of the grazing angle, but positive for ^{27}Al in the backward region of the grazing angle. As intermediates of these two cases, ^{nat}Fe and ^{45}Sc targets were used; polarization in the region of the largest kinetic energy is negative in sign for ^{nat}Fe and zero for ^{45}Sc intermediate of the lightest and the heavier targets. (8 refs.)

112279 Semiquantitative analysis of heavy-ion transfer reactions. Y.Miyama, T.Kammuri (Dept. of Phys., Osaka Univ., Osaka, Japan).

Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.850-4

In their semiquantitative approximation to the DWBA transition matrix of the heavy-ion transfer reaction, Hasan and Brink (1978, 1979) used the Fourier expansion method and took the recoil effect into account. The authors reformulate it in a more conventional way by treating the coupling of angular momenta exactly. They apply the theory to the analysis of angular distributions and energy spectra of ejectiles. The calculated energy spectrum is composed of the cross sections to the bound, resonant and non-resonant states of the residual nucleus. (8 refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

112280 Parametrization of the total cross section for $\pi d\rightarrow pp$ below 330 MeV. B.G.Ritchie (Dept. of Phys. & Astron., Univ. of South Carolina, Columbia, SC, USA).

Phys. Rev. C (USA), vol.28, no.2, p.926-8 (Aug. 1983).

The parametrizations developed by Spuller and Measday for the energy dependence of the total cross section for $\pi d\rightarrow pp$, which have been used to normalize some $\pi d\rightarrow pp$ angular distributions, are reviewed in light of high accuracy data taken since 1975. Slight modifications of the parameters of the earlier analysis yield significant improvement in the agreement with the newer data. A simpler parameterization which fits the data equally well is suggested for absolute normalizations of relative angular distributions for the process. (14 refs.)

112281 Systematics of pion-nucleus optical potentials from analysis of elastic scattering. E.Friedman (TRIUMF, Vancouver, BC, Canada).

Phys. Rev. C (USA), vol.28, no.3, p.1264-71 (Sept. 1983).

Most of the available data on the elastic scattering of pions by nuclei between 14 and 80 MeV are analyzed with a complex local optical potential which is parametrized by a bias-free Fourier-Bessel series, and is used as a means of extracting as much information from the data as possible without the explicit use of a model for the interaction. A typical shape of a negative real potential at large radii with a positive one at smaller radii is obtained and a systematic dependence on energy, charge of the pion, and isospin of the target is observed. The Kisslinger potential is shown to reproduce all these systematics, whereas the Laplacian potential fails to do so. Some results for energies of up to 230 MeV are also analyzed. The dependence of reaction cross sections on the real potential is discussed. (25 refs.)

112282 Nuclear medium effects in pion elastic scattering and charge exchange. W.B.Kaufmann, W.R.Gibbs (Dept. of Phys., Arizona State Univ., Tempe, AZ, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1286-300 (Sept. 1983).

The three body approximation of the pion-nucleus optical model is used to calculate effective strengths to be used in conventional calculations. The resulting wave functions are used to calculate pion elastic scattering and single charge exchange. It is found that observed energy shifts in elastic scattering can be understood. Considerable change in the magnitude and shape (as a function of energy) of the charge exchange section is a direct result of these corrections. (29 refs.)

112283 Analysis of elastic and inelastic scattering of 162 MeV pions from ^{13}C by an optical potential and a collective model. S.J.Seestrom-Morris, D.Dehnhard, M.A.Francy (Univ. of Minnesota, Minneapolis, MN, USA), C.L.Morris, R.L.Boudrie, H.A.Thiessen.

Phys. Rev. C (USA), vol.28, no.3, p.1301-8 (Sept. 1983).

Data for elastic scattering of π^+ and π^- from ^{13}C at $T_\pi=162$ MeV between $\theta_{\text{lab}}=22^\circ$ and 105° were analyzed by an optical model. Good fits were obtained with neutron and proton ground state densities of three-parameter Fermi shape having the same RMS radius. Inelastic data for the quadrupole transitions to the $3/2^-$ (3.68 MeV) and $5/2^-$ (7.55 MeV) states and the octupole transition to a proposed $5/2^+$, $7/2^+$ doublet (11.82 MeV) were analyzed using a collective model. The extracted strengths for the neutron and proton parts of the transitions are compared to the results of electron scattering and γ -ray studies. (25 refs.)

112284 Higher-order field effects in pion absorption on two nucleons. G.Kalbermann, J.M.Eisenberg (Dept. of Phys. & Astron., Tel Aviv Univ., Tel Aviv, Israel).

Phys. Rev. C (USA), vol.28, no.3, p.1318-23 (Sept. 1983).

The authors estimate the rescattering diagrams involving intrinsically third-order effects in the pionic field for the process of pion absorption at rest on a pair of nucleons. The calculation is performed using a chiral bag model adapted for the correct description of higher-order pionic effects. The model provides the form factors needed in order to achieve a convergent result. The third-order diagrams cancel in part; nevertheless, the net result is as important as the conventional second-order s -wave rescattering mechanism for reasonable bag radii $R\sim 1$ fm and becomes dominant for bag radii $R\leq 0.7$ fm for internucleon distances less than about 2 fm. (12 refs.)

112285 Positive pion absorption on deuterium at energies above the 3,3 resonance. E.L.Mathie, G.R.Smith, E.Boschitz, J.Hoftiezer (Inst. für Experimentelle Kernphys., Univ. Karlsruhe, Karlsruhe, Germany), M.Meyer.

Z. Phys. A (Germany), vol.313, no.1-2, p.105-10 (1983).

Angular distributions of the differential cross section for positive pion absorption on the deuteron have been measured at 170, 208 and 285 MeV. The data have been fitted with Legendre polynomials. Along with other recent experiments, these data are compared with recent theoretical descriptions. (17 refs.)

25.85 FISSION REACTIONS

112286 Isotopic and neutron yields of products from the asymmetric and near-symmetric proton-induced fission of ^{233}U and ^{235}U . P.A.Beeley, L.Yaffe, M.Chatterjee, H.Dautet, J.K.P.Lee (Foster Radiation Lab., McGill Univ., Montreal, Quebec, Canada).

Phys. Rev. C (USA), vol.28, no.3, p.1188-205 (Sept. 1983).

The isotopic yields of Rb, In, and Cs from the 40-100 MeV proton-induced fission of ^{233}U and ^{235}U , and the isotopic yields of Ga from the 80 and 100 MeV proton-induced fission of ^{233}U have been measured by on-line mass spectrometry. The yields have been normalized to the independent formation cross sections of selected isotopes measured radiochemically. Total numbers of neutrons emitted per fission event have been deduced from the centroids of the isotopic distributions. The equal charge displacement, minimum potential energy, and unchanged charge distribution mechanisms have been investigated. It is found that the charge-division mechanism is fragment-mass depen-

dent, the minimum potential energy postulate being attributed to asymmetric fission events and the unchanged charge distribution postulate being attributed to near-symmetric fission events. (48 refs.)

112287 Dependence of fragment angular momentum on entrance channel in ^{236}U fission. T.Datta, S.M.Sahakundu, S.P.Dange, N.Chakravarty, R.Guin, S.Prakash (Radiochem. Div., Bhabha Atomic Res. Centre, Bombay, India). *Phys. Rev. C (USA)*, vol.28, no.3, p.1206-11 (Sept. 1983). In the present work the influence of initial excitation energy and angular momentum of the fissioning system on the angular momenta of fission fragments corresponding to ^{131}Te and ^{133}Te was studied in the $^{232}\text{Th}(\alpha_{30}\text{ MeV})$ system. The fragment angular momenta were estimated from the radiochemically determined independent isomeric yield ratios using a statistical model. The obtained data are discussed along with the literature data on the fragment angular momenta in the same fissioning nucleus ^{236}U formed in the $^{235}\text{U}(n_{\text{th}},f)$ and $^{232}\text{Th}(\alpha,f)$ systems. (21 refs.)

112288 Neutron-induced fission of ^{232}Th near threshold. S.T.Lam, L.L.Yu, H.W.Fielding, W.K.Dawson, G.C.Neilson (Nuclear Res. Centre, Univ. of Alberta, Edmonton, Alberta, Canada). *Phys. Rev. C (USA)*, vol.28, no.3, p.1212-16 (Sept. 1983). Fission of ^{232}Th was induced by a pulsed beam of monoenergetic fast neutrons. A heavy-ion surface barrier detector was used for the detection of fission fragments. Fragment mass was determined from measured fragment energy and fragment flight time. Fragment mass distribution and correlation of fragment kinetic energy with fragment mass were obtained for neutron incident energies of 1.6, 3.1, and 5.2 MeV. A strong dependence on shell energy is suggested from the increase of the most probable total kinetic energy of the fission fragments with increase in excitation energy of the compound nucleus. (10 refs.)

112289 ^3He -induced fission of nuclei $159 < A < 232$. F.D.Becchetti (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA), K.H.Hicks, C.A.Fields, R.J.Peterson, R.S.Raymond, R.A.Ristinen, J.L.Ullmann, C.S.Zaidins. *Phys. Rev. C (USA)*, vol.28, no.3, p.1217-23 (Sept. 1983). The fission of nuclei with $159 \leq A \leq 232$ induced by the bombardment of 19.1 to 44.5 MeV ^3He ions has been measured using solid-state detectors with time-of-flight measurements. Analysis with statistical fission theory, including precompound nucleon emission, indicates fission barriers which decrease not only slightly relative to the liquid-drop model values with decreasing Z, approaching about 90% of the liquid-drop model barrier for $A \approx 160$. These results are in contrast with measurements at higher angular momenta which indicate much lower fission barriers (60 to 70% of the liquid-drop model) for this mass region. (39 refs.)

112290 Fission and pairing degrees of freedom in collective transport theory. A.S.Jensen, J.Leffers (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), H.Hofmann, P.J.Siemens. *Phys. Scr. (Sweden)*, vol.T5, p.186-9 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The relevant pieces of the collective transport theory is briefly sketched. Then numerical results for the fission and pairing degrees of freedom of the nucleus ^{238}U are presented. Quadrupole and hexadecapole vibrations around the equilibrium deformation are extracted. The β - and giant quadrupole vibrations are identified. One hexadecapole and two new quadrupole vibrations are predicted. Pairing vibrations are obtained and the number of broken pairs during descent from saddle to scission is estimated. (10 refs.)

112291 Reassessment of fission fragment angular distributions from continuum states in the context of transition-state theory. L.C.Vaz, J.M.Alexander (Dept. of Chem., State Univ. of New York, Stony Brook, NY, USA). *Phys. Rep. (Netherlands)*, vol.97, no.1, p.1-30 (July 1983). Fission angular distributions have been studied for years and have been treated as classic examples of transition-state theory. Early work involving composite nuclei of relatively low excitation energy E^* (≤ 35 MeV) and spin I ($\leq 25\hbar$) gave support to theory and delimited interesting properties of the transition-state nuclei. More recent research on fusion fission and sequential fission after deeply inelastic reactions involves composite nuclei of much higher energies (≤ 200 MeV) and spins ($\leq 100\hbar$). Extension of the basic ideas developed for low-spin nuclei requires detailed consideration of the role of these high spins and, in particular, the 'spin window' for fission. The authors have made empirical correlations of cross sections for evaporation residues and fission in order to get a description of this spin window. A systematic reanalysis has been made for fusion fission induced by H, He and heavier ions. Empirical correlations of K_0^2 ($K_0^2 = J_{\text{eff}}/h^2$) are presented along with comparisons of J_{eff} to moments of inertia for saddle-point nuclei from the rotating liquid drop model. This model gives an excellent guide for the intermediate spin zone ($30 \leq I \leq 65$), while strong shell and/or pairing effects are evident for excitations less than ≤ 35 MeV. Observations of strong anisotropies for very high-spin systems signal the demise of certain approximations commonly made in the theory, and suggestions are made toward this end. (120 refs.)

25.88 FUSION REACTIONS

112292 Incomplete-fusion reactions in the $^{12}\text{C} + ^{118}\text{Sn}$ system at $E(^{12}\text{C}) = 118$ MeV. S.E.Arnell, S.Mattsson, H.A.Roth, O.Skeppstedt (Chalmers Univ. of Technol., Goteborg, Sweden), S.A.Hjorth, A.Johnson, T.Lindblad, J.Nyberg, L.Westerberg. *Phys. Scr. (Sweden)*, vol.T5, p.199-203 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). The emission of charged particles in coincidence with γ -rays from the $^{12}\text{C} + ^{118}\text{Sn}$ system at $E(^{12}\text{C}) = 118$ MeV has been studied. Energy spectra and relative cross sections for He, Li, Be and B ejectiles have been measured. The results are compared to the sum-rule model of Wilczynski et al., (1980). (27 refs.)

112293 Complete and incomplete fusion-fission processes induced by light ions. T.Matsuse (CRN, Univ. Louis Pasteur, Strasbourg, France), S.M.Lee, A.Arima. Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.841-4. The authors discuss their model (1980, 1982) for understanding the heavy-ion fusion cross section quantitatively using a schematic diagram. The method for finding the fully equilibrated compound nucleus using the model is presented. In order to test the validity of the prediction for incomplete fusion, the model is applied to the $^{232}\text{U}(\alpha,X)$ system, whereas the complete fusion cross section is tested with $^{26}\text{Mg}(^{20}\text{Ne},X)$. 28.00 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

(see also 86.10 Energy resources and their utilisation)

28.20 NEUTRON PHYSICS

(see also 25.40 Nucleon-induced reactions and scattering)

112294 The implication of sensitivity analysis on the safety and delayed-neutron parameters for fast breeder reactors. R.J. Onega, R.J. Florian (Dept. of Mech. Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

Ann. Nucl. Energy (GB), vol.10, no.9, p.477-90 (1983).

The delayed-neutron energy spectra for LMFBRs are not as well known as those for LWRs. These spectra are necessary for kinetics calculations which play an important role in safety and accident analyses. A sensitivity analysis was performed to study the response of the reactor power and power density to uncertainties in the delayed-neutron spectra during a rod-ejection accident. The accidents studied were central control-rod ejections with ejection times of 2, 10 and 30 s. A two-energy group and two-precursor group model was formulated for the International Nuclear Fuel Cycle Evaluation (INFCE) reference design MOX-fueled LMFBR. The power and power-density responses were found to be most sensitive to uncertainties in the spectrum of the second delayed-neutron precursor group, resulting from the fission of ^{238}U , producing neutrons in the first energy group. It was found, for example, that for a rod-ejection time of 30 s, an uncertainty of 7.2% in the fast components of the spectra resulted in a 24% uncertainty in the predicted power and power density. These responses were recalculated by repeatedly solving the kinetics equations. The maximum discrepancy between the recalculated and the sensitivity analysis response was only 1.6%. The results of the sensitivity analysis indicate the need for improved delayed-neutron spectral data in order to reduce the uncertainties in accident analyses. (12 refs.)

112295 Reproduction of transport calculation results by diffusion theory employing albedo boundary conditions. W. Waschull (Forschungszentrum Geesthacht GmbH, Geesthacht, Germany).

Atomkernenerg. Kerntechnik (Germany), vol.42, no.1, p.39-49 (1983).

The results of a transport calculation in 45 energy groups for the PWR Obrigheim should be reproduced by diffusion calculations. Indicators taken into account are the multiplication factor, the maximal shape factor and the flux ratio between fast and thermal neutron flux. It is shown, that a reproduction with normal core and reflector group constants is not possible, because of the insufficient description of the reflector by diffusion theory. The correction of reflection diffusion constants, is proved to be useless. Assessing the influence of all theoretically possible values for the albedo on the indicators mentioned above a simple method was found to determine 2-group-albedos. These albedos reproduce the results of the 45-group-transport-calculation. (6 refs.)

112296 Numerical performance of the A_n method and comparisons with S_N calculations. G. Coppa, P. Ravetto, M. Sumini (Dipartimento de Energetica, Politecnico di Torino, Torino, Italy).

Atomkernenerg. Kerntechnik (Germany), vol.42, no.2, p.107-10 (1983).

The numerical S_N code ANISN is employed to perform A_n calculations using its multigroup diffusion feature, in order to test the applicability of the A_n method to neutron reactor calculations. Different geometrical configurations are analysed. It is found that the A_n approximate method, which reduces to a system of second order differential equations, might well be used to yield reliable results in all sorts of neutron transport calculations. (10 refs.)

112297 Limitation of the Mellin transform for small angle scattering by nearly spherical particles. S. Melone, P. Puliti (Dipartimento di Sci. dei Materiali e della Terra, Facoltà di Ingegneria, Univ. di Ancona, Ancona, Italy), F. Rustichelli.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.459-62 (1 Sept. 1983).

An analysis of the limit of validity of the Mellin transform when applied to small angle scattering curves produced by nearly spherical particles, i.e. by ellipsoids of semi-axes a , a , va , was performed. The width of the assumed Gaussian distribution for the v values was used as a parameter. When this width tends to zero the inaccuracy of the Mellin transform vanishes as expected. However the inaccuracy becomes appreciable for large values of the width. In spite of this, the total volume fraction and the average radius of the scattering particles is also obtained by the Mellin transform with very high accuracy for large values of the width of the Gaussian distribution. (4 refs.)

112298 Neutron spectra unfolding from measured detector activations. The computer programme SAND-MX2. L. Weise.

Report JUL-1837, Kernforschungsanlage, Jülich, Germany (March 1983), 137 pp. In German.

Our knowledge of the neutron spectrum in irradiation facilities essentially rests on the calculation of the unfolding adjustment based on measured activations. In this situation the neutronic calculation by no means renders superfluous the unfolding because the measurements can confirm or possibly improve the calculational results. The FORTRAN code SAND-MX2 is a contribution of the KFA to the international repertoire of unfolding codes. With regard to its contents it is one of the newer versions of the original code SAND-II. This report may serve as an instruction manual for routinely neutron spectrum unfolding by means of the code SAND-MX2. (49 refs.)

28.41 FISSION REACTOR THEORY AND DESIGN

112299 On the non-linear dynamical power-reactor model with temperature feedback. H. Konno (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan).

Ann. Nucl. Energy (GB), vol.10, no.9, p.451-6 (1983).

The author studies the non-linear dynamical power-reactor model which has a simple feedback loop from temperature and three external noise sources. By contracting the temperature, the reduced non-linear stochastic differential equation for neutrons is derived. Then, the influence of the inherent and external noises upon the stationary distribution of the neutrons is clarified. It is shown that: (1) the contraction method developed in non-equilibrium statistical physics is available for power-reactor modelling; and (2) the correlations among the external noise sources not only characterize the existence of multiple feedback loops in power reactors but also play a role in suppressing the deterministic transition by external noises. (17 refs.)

112300 Integration of the time-dependent heat equation in the fuel rod performance program IAMBUS. G. West.

Atomkernenerg. Kerntechnik (Germany), vol.41, no.4, p.281-4 (1982). In German. [received: Sept. 1983]

An iterative numerical method for integration of the time-dependent heat equation is described. No presuppositions are made for the dependency of the thermal conductivity and heat capacity on space, time and temperature. (5 refs.)

112301 SUPERC, a one-dimensional code system for the analysis of the seed-blanket core with movable fuel control. A. Galperin (Dept. of Nuclear Engng., Ben-Gurion Univ. of the Negev, Beer Sheva, Israel).

Atomkernenerg. Kerntechnik (Germany), vol.42, no.1, p.16-18 (1983).

SUPERC, a code system for the analysis of the seed-blanket cores with movable fuel control is presented. Two main modules of this system are the WIMS-D and ANISN codes. SUPERC is 'easy-to-operate' and a relatively fast tool, thus suitable for the initial feasibility studies and parametric optimization of the new concept involving seed-blanket geometry. It is shown that the effect of the seed-blanket interaction is not negligible, in some cases, and should be taken into account in the depletion calculations. (10 refs.)

112302 Some remarks on modeling uncertainties. Y. Ronen (Dept. of Nuclear Engng., Ben-Gurion Univ. of the Negev, Beer Sheva, Israel).

Atomkernenerg. Kerntechnik (Germany), vol.42, no.1, p.29-32 (1983).

Several topics related to the question of modeling uncertainties are considered. The first topic is related to the use of the generalized bias operator method for modeling uncertainties. The method is expanded to a more general form of operators. The generalized bias operator is also used in the inverse problem and applied to determine the anisotropic scattering law. The last topic discussed is related to the question of the limit to accuracy and how to establish its value. (33 refs.)

112303 A simulator of the nuclear power plant and its functions.

R. Szczerski (Zakład Energetyczny, Bielsko-Biala, Poland).

Energetyka (Poland), vol.37, no.4, p.145-8 (April 1983). In Polish. [received: Sept. 1983] (no refs.)

112304 Neutron design study of BN 600 type reactor with plutonium fuel.

J. Kujal (Ústav Jaderneho Vyzkumu, Rez, Czechoslovakia).

Jad. Energ. (Czechoslovakia), vol.29, no.8-9, p.297-301 (Aug.-Sept. 1983). In Czech.

This paper contains a brief description of neutron design study of the BN 600 type reactor with plutonium fuel. Reactor parameters for both fundamental states of an equilibrium fuel cycle after and before charge-discharge are presented as well as some parameters of fuel cycles. (5 refs.)

112305 Comparison of measured fission gas releases for Windscale AGR fuel irradiated above 18 GwD/tU with those predicted using the computer code MINIPAT D. N. Beatham, R. Hargreaves, R. D. Walker, R. Kirkbride.

Report ND-R-803(W), UKAEA, Risley, Lancs., England (Aug. 1982), 26 pp.

Available from HMSO, London, England.

MINIPAT D is a computer code for predicting fission product gas release into the voidage of thermal reactor fuel pins. It also calculates the variation of internal pressure within a pin during irradiation. This paper examines how well the code predicts fission gas release from high burn-up AGR fuel. All the data are provided from the Windscale prototype AGR. Fuel pins included in the investigation came from elements where the mean burn-up exceeded 18 GwD/tU. (1 ref.)

112306 CANSWEL-2: A computer model of the creep deformation of Zircaloy cladding under loss-of-coolant accident conditions. Part II. User notes. T. J. Hastie.

Report ND-R-814 (S) Part 2, UKAEA, Risley, Lancs., England (March 1983), 49 pp.

Available from HMSO, London, England.

For pt. I see UKAEA Report ND-R-814 (S) 1, (1982). Notes are provided on the use of CANSWEL-2 in its stand-alone form. They include descriptions of the input data format, job control language for IBM and ICL computers, and examples of the different output options.

112307 SIMULATE-E: A nodal core analysis program for light water reactors. Computer code user's manual. W. R. Cobb, R. S. Borland, P. L. Versteegen.

Report EPRI-NP-2792-CCM, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 416 pp.

Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.

Contains the method descriptions and user's manual for the LWR nodal core analysis computer program SIMULATE-E. A description of the coding, several sample problems, one benchmark problem, and code installation instructions are provided.

112308 Assessment of SPEAR-FCODE-BETA for fuel licensing.

I. B. Fiero, H. R. Freeburn, A. M. Garde, M. A. Krammen, P. L. Rotondo.

Report EPRI-NP-2939, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 74 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

The SPEAR-FCODE-BETA fuel performance code is assessed for adequacy in simulating fuel performance in fuel licensing proceedings. A detailed review of the thermal and mechanical performance models of greatest import and to fuel licensing—including fission gas release, fuel temperatures, and cladding uniform strain—is presented. The report recommends modelling and usability improvements.

112309 Berechnungsmethoden und Analysen zum dynamischen Verhalten von Kraftwerksanlagen mit Hochtemperaturreaktor (Computation methods and analyses on the dynamic behaviour of power plants with high temperature gas cooled reactors). J. Banaschek.

Report JUL-1841, Kernforschungsanlage, Jülich, Germany (April 1983), 107 pp. In German.

The author describes the computation models and methods used in a new developed computer code for the analysis of the dynamic behaviour of nuclear power plants with High Temperature Gas Cooled Reactor. The subprograms which have been united to an integrated code are described in detail. The field of application of this code reaches from investigations on transients under normal operation to the thorough description of the load laid on the plant under extreme accidental conditions. The application of the code is shown in two sample cases. The investigations are done for a controlled variation in load of the THTR-300 MW_e power station and the behaviour of a 200 MJ/s process-steam-plant in case of a failure of active after-heat-removal. (42 refs.)

112310 First investigations on a wrapped fibre blanket insulation with massive spacers consisting of carbon fibre composite. P.Brockhoff, D.Stausebach.

Report JUL-1840, Kernforschungsanlage, Julich, Germany (April 1983), 62 pp. In German.

The insulation for the secondary hot gas duct system of a High Temperature Reactor is described. This insulation has been designed by INTERATOM. It consists of inner tubes made of graphite on which fibre blankets are wrapped. Massive spacers consisting of Carbon Fibre Composite (CFC) bear the inner tubes. Experiments have been carried out in the high pressure wind tunnel with the media air and helium. Because of corrosion the temperature was restricted to 300°C when using air. The maximum helium temperature was about 400°C. The influence of temperature, pressure and velocity was studied. (15 refs.)

112311 New HTR conception for a modular system with block-fuel elements and its comparison with an HTR with ball-shaped fuel shaped elements. K.Yamashita.

Report JUL-1842, Kernforschungsanlage, Julich, Germany (April 1983), 87 pp. In German.

The concept of the modular High Temperature Reactor with block-fuel elements is developed and a comparison with the modular Pebble Bed High Temperature Reactor is performed. The fitting of a graphite column into the mean core zone serves to limit the maximum fuel element temperature to less than 1600°C in the case of a loss-of-coolant-accident. The 'Push through'-loading can decrease the fuel element temperature under normal operation. Under normal operation the Pebble Bed High Temperature Reactor is characterized by a low fuel element temperature. The loss of pressure in the core has a low value of 0.2 bar at a system pressure of 40 bar. In the primary cycle therefore the system pressure can be decreased with respect to the endothermal reaction by the nuclear process heat application. (27 refs.)

112312 VIPRE-01: A thermal-hydraulic analysis code for reactor cores. Vol.I: Mathematical modeling. C.W.Stewart, J.M.Cuta, A.S.Koontz, J.M.Kelly, K.L.Basehore, T.L.George, D.S.Rowe.

Report EPRI-NP-2511-CCM, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 274 pp.

Available from Research Report Center, Box 50390, Palo Alto, CA 94303, USA.

Details the mathematical modeling of the VIPRE code, which was developed for nuclear power utility thermal-hydraulic analysis applications. The theoretical development of the general questions, constitutive relationships, correlations, and numerical solution techniques are summarized.

112313 VIPRE-01: A thermal-hydraulic analysis code for reactor cores. Vol.II: User's manual. J.M.Cuta, A.S.Koontz, C.W.Stewart, S.D.Montgomery.

Report EPRI-NP-2511-CCM, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 668 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

For pt.I see EPRI Report EPRI-NP-2511-CCM (1983). Contains the user's manual for VIPRE, an EPRI computer code developed for nuclear power utility thermal-hydraulic analysis applications. Input requirements of VIPRE and its auxiliary programs—ASP, SPECSET, and DECCON—are described, and the input instructions for each code are provided.

112314 SPEAR-FCODE-GAMMA functional specifications. I.B.Fiero.

Report EPRI-NP-2941, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 44 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Documents SPEAR-FCODE-GAMMA (SFG), a conceptual fuel performance code for use in licensing analyses, which has been defined and characterized as a set of functional specifications. The potential licensing-related applications of SFG are established and discussed. General code specifications, including regulatory, interface, hardware application, code model and software, and operational specifications, are discussed as well as input and output data requirements, formatting aspects, and accuracy guidelines.

28.42 FISSION REACTOR MATERIALS

112315 Calculation of carburization profiles in stainless steel components in a liquid sodium environment. S.R.Srinivasan (Res. & Dev. Dept., Rourkela Steel Plant, Rourkela, India).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.285-9 (1982). [received: Sept. 1983]

A method has been developed to calculate the carbon concentration profiles in stainless steel clad and intermediate heat exchanger tubes in a sodium cooled LMFBFR (liquid metal cooled fast breeder reactor). The method is based on solving the differential equation for coupled diffusion cum precipitation kinetics using the implicit finite difference technique. In this method the 'ad-hoc' manner, adopted by Snyder et al. (1974), of treating the precipitation reaction is avoided. The present method has several advantages including a significant saving in computation time. (7 refs.)

112316 An advanced modular scheme for reactor and in-core fuel management calculations. Y.Abushady (Nuclear Engng. Dept., Alexandria Univ., Alexandria, Egypt).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.1, p.50-4 (1983).

ALUN, in its present version, is a modular system for reactor and in-core fuel management calculations, specially recommended for installations having limited computational capabilities. The module is capable for the calculation of the power distribution, power peaking factor, reactivity, operating cycle length, criticality searches, thermal constraints, material temperatures, density distribution, pressure drop, pumping power, isotopic concentrations of the spent fuel and other requirements. The module can propose suggestions for different nuclear fuel management decisions involving; the enrichment of the fuel, the number of fuel assemblies, the placement of the assemblies within the core and the operating history of the reactor. New aspects in the application of different mathematical models are included in different stages of the module. (16 refs.)

112317 Analysis of radioactive waste solutions by atomic absorption spectrometry with electrothermal atomization. G.Rossi, N.Omenetto, G.Pigozzi, R.Vivian (Chem. Div., Joint Res. Centre Establ., Ispra, Italy), U.Mattiaz, F.Mousty, G.Crabi.

At. Spectrosc. (USA), vol.4, no.4, p.113-17 (July-Aug. 1983).

The application of electrothermal atomic absorption spectrometry to the analysis of nuclear high- and medium-activity waste solutions is presented. An apparatus based on that analytical technique has been devised and used for remote operation under safe conditions. For this purpose, the graphite furnace and the associated auto-sampler are enclosed in a specially devised glove box. The assembly, which required marginal modifications of the commercial components, was shown to be successfully applicable to routine determination of Ba, Cr, Fe, Mn, Mo, Pd, Rh, and Sr. (2 refs.)

112318 Primary coolant treatment by ion exchangers—experience from the operation of nuclear power stations with pressurized water reactors. K.-H.Walter (Gemeinschaftskernkraftwerk Neckar GmbH, Neckarwestheim, Germany).

VGB Kraftwerkstechnik. (German Ed.) (Germany), vol.63, no.8, p.706-12 (Aug. 1983). In German.

A working party of the VGB Specialist Committee on Chemistry in Nuclear Power Stations has collated and evaluated experience with ion exchangers for primary coolant treatment in pressurized water reactors. In spite of difficulties from time to time, a generally favourable picture of the effectiveness of this method of treatment emerged. Radioactive waste can be minimized by good operational planning. (5 refs.)

112319 Investigation of material movement within steel test sections by means of high speed X-ray photography. H.Will, P.Menzenhauer, W.Peppler (Inst. für Reaktorentwicklung, Kernforschungszentrum Karlsruhe, Karlsruhe, Germany).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.16-21 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

In simulation experiments the consequences of hypothetical reactor accidents are investigated. The materials involved in the tests, as well as the temperatures, require test sections of steel. To follow the material movement and relocation X-ray cine equipment was developed. The test section is radiated from three axially positioned X-ray sources, electro-optical image amplifiers transform the material density distribution into a visible picture, which is picked up by high speed cameras with, typically, 1000 pictures per second. The resolution of the system is about 1 mm³ of steel with a small dependence on the total thickness of the test section. The technique, its main features and limitations are described and some experimental results are presented. The computer aided analysis of the X-ray high speed films is also explained. (2 refs.)

112320 The Synroc solution. A.E.Ringwood (Res School of Earth Sci., Australian Nat. Univ., Canberra, Australia).

Nucl. Active (S. Africa), no.29, p.16-20 (July 1983).

High-level radioactive wastes from nuclear reactors may be incorporated in synthetic rock (Synroc), claimed to be far more resistant to groundwater leaching than borosilicate glass. Australia's synthetic rock strategy simulates nature's method of immobilising radioactive elements. (11 refs.)

112321 More light on the U clan. S.A.de Waal (Potchefstroom Univ., Potchefstroom, S Africa).

Nucl. Active (S. Africa), no.29, p.21-3 (July 1983).

Uranium mineralogy has proved of vital importance in geological exploration and extraction engineering. As the demand for uranium as a fuel for nuclear power reactors escalates, research on the behaviour of uranium minerals in complex ores can be expected to intensify. (4 refs.)

112322 A risk count for nuclear waste. A.Jacobi,Jr. (Electrowatt Engng. Services Ltd., Zurich, Switzerland).

Nucl. Active (S. Africa), no.29, p.28-32 (July 1983).

Probabilistic risk assessment used increasingly to assess nuclear power plant safety could be applied equally well to nuclear waste repositories according to the author. He claims that the technique offers greater advantages than the classical, e.g. deterministic, safety analyses. (no refs.)

- 112323 Thermodynamic properties of $\text{Th}_{0.80}\text{U}_{0.20}\text{O}_{2+x}$ solid solution.** M.Ugajin, T.Shiratori, K.Shiba (Thorium Fuel Lab., JAERI, Tokai-mura, Ibaraki-ken, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.172-7 (June 1983). Oxygen-potential (ΔG_{O_2}) measurements employing a thermogravimetric method have been performed for $\text{Th}_{0.80}\text{U}_{0.20}\text{O}_{2+x}$. A complete set of data is presented at 1273-1473K in the ranges $2.000 \leq \text{O}/\text{M} \leq 2.024$ and $-95 \leq \Delta G_{\text{O}_2} \leq -32$ kcal/mol. Partial molar entropies and enthalpies of solution of oxygen in the mixed oxide were derived from the temperature variation of ΔG_{O_2} . Vapour pressures over $\text{Th}_{0.80}\text{U}_{0.20}\text{O}_{2+x}$ at 2000-2300K were calculated from experimental ΔG_{O_2} data and the known free energies of formation for gaseous and condensed oxides. It is predicted that with an increase in O/M ratio the vapour pressure of $\text{UO}_3(\text{g})$ increases rapidly while maintaining an extremely lower pressure of $\text{ThO}_2(\text{g})$. (22 refs.)
- 112324 Oxygen potential and lattice parameter measurements in (U, Ce) O_{2-x} .** D.I.R.Norris, P.Kay (Berkeley Nuclear Labs., CEGB, Berkeley, England). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.184-94 (June 1983). Studies have been carried out on (U, Ce) O_{2-x} to assist the understanding of oxygen behaviour in the fast reactor fuel (U, Pu) O_{2-x} . Oxygen potentials at 1123K and lattice parameters after rapid cooling to room temperature have been determined as functions of O/M ratio for Ce/(U+Ce) ratios of 0.148 and 0.282. The results show some similarities between the two mixed oxides, but also important differences. The Markin-McIver rule, that oxygen potential at a given temperature is a function only of the supposed plutonium valence, does not apply with cerium. Simple cluster models are basically inconsistent with experimental data and a complex cluster model requires further development before it can account for the oxygen potential behaviour of (U, Ce) O_{2-x} . The ratio of lattice parameter change to O/M ratio change in $\text{U}_{1-x}\text{Ce}_x\text{O}_{2-x}$ is not strongly dependent on y and averages 0.30 \AA , slightly greater than the corresponding value for $\text{U}_{1-y}\text{Pu}_y\text{O}_{2-x}$. A transition to a room-temperature two-phase structure occurs at an O/M ratio of about 1.985 for $y=0.282$. (20 refs.)
- 112325 Distribution of fission and activation products in the graphite sleeves of HTGR fuel rods: first and second OGL-1 fuels.** K.Hayashi, T.Kikuchi, F.Kobayashi, K.Minato, K.Fukuda, K.Ikawa (JAERI, Ibaraki-ken, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.233-43 (June 1983). In order to develop the fuel of a high temperature gas-cooled reactor, axial and radial profiles of fission and activation products in the graphite sleeves of the first and second fuel assemblies irradiated in the in-pile gas loop OGL-1 were measured by means of lathe sectioning, gamma spectrometry, and ion-exchange separation. Several sharp axial profile peaks of ^{90}Sr , ^{134}Cs , and ^{137}Cs were observed for the second fuel sleeves. The peaks are assigned to the failed coated fuel particles; the rest of the profiles to the contamination uranium contained in the fuel compact matrix. Fission products with lower diffusivity such as ^{90}Sr , ^{106}Ru , and ^{144}Ce were completely retained in the second fuel sleeve, whereas similar effectiveness in retention was not observed for ^{134}Cs and ^{137}Cs . Diffusion coefficients of cesium and strontium have been roughly estimated through the comparison between the measured and the simply calculated profiles in the sleeve. (15 refs.)
- 112326 Investigation of the oxygen activity of oxide fuels and fuel-fission product systems by solid electrolyte techniques. I. Qualification and limitations of the method.** K.Teske, H.Ullmann, D.Rettig (Central Inst. for Nuclear Res. Rossendorf, Dresden, Germany). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.260-6 (June 1983). The possibilities and limitations of the application of solid electrolyte techniques to the investigation of oxide nuclear fuel materials have been discussed. The solid electrolyte coulometry has been developed for the investigation of oxygen potentials and O/M-ratios of oxide samples. Example measurements on non-irradiated nuclear fuel oxide samples demonstrated the various possibilities of investigations such as O/M-determination, oxygen potential versus O/M-relations and simultaneous titration of impurities in oxide materials. The experimental arrangement and the small sample weights required are preferable conditions for the application of the method to alpha- or gamma-active materials. Solid electrolyte coulometry is recommended as a precise investigation method which works without calibration. (18 refs.)
- 112327 Thermal conductivity of near-stoichiometric (U, Pu, Nd) O_2 and (U, Pu, Eu) O_2 solid solutions.** S.Fukushima, T.Ohmichi, A.Maeda, M.Handa (JAERI, Tokai-mura, Naka-gun, Ibaraki-ken, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.287-96 (June 1983). The thermal conductivities of near-stoichiometric $(\text{U}_{0.8}\text{Pu}_{0.2})_2\text{R}_2\text{O}_2$ solid solutions containing $\text{RO}_{1.5}$ ($\text{R}=\text{Nd}$ or Eu) up to 10 mol.% were determined by the laser flash method in the temperature range 700-1900K. The thermal conductivities for the solid solutions up to about 1550K satisfied the phonon conduction equation, $K=(A+BT)^{-1}$. The thermal conductivity decreased gradually with the increase of the rare earth content. This decrease was mainly caused by the lattice defect thermal resistance. The measured defect thermal resistivities ($=A$) were in good agreement with the calculated results based on the lattice defect model in which U^{4+} , U^{5+} , Pu^{4+} and R^{3+} ions were considered as phonon scattering centers. The lattice strain parameter $e=97$ and 103 were obtained for (U, Pu, Nd) O_2 and (U, Pu, Eu) O_2 solid solutions, respectively. The lattice strain effects on the thermal resistivity was about 15 times larger than the mass difference one. (24 refs.)
- 112328 UO_2 fuel pellet microstructure modification through impurity additions.** K.C.Radford, J.M.Pope (Nuclear Materials Dept., Westinghouse Res. Labs., Pittsburgh, PA, USA). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.305-13 (June 1983). The thermal densification of UO_2 pellets containing small amounts of the sintering aids Ti, V, Nb and Ca+Ti has been studied to determine the changes in grain size and pore size distribution. Additive levels above 0.5 mol.% greatly increased the grain size and increased the size of the fine porosity, but also reduced the sintered density. A comparison was made between the microstructure of fuel whose density had been reduced by this means and that produced by the addition of small amounts of the known density suppressants, Ba and Sr. (30 refs.)
- 112329 Phase transitions, creep, and fission gas behaviour in actinide oxides.** L.Leibowitz, J.K.Fink (Argonne Nat. Lab., Chem. Technol. Div., Argonne, IL, USA), O.D.Slagle. *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.324-5 (June 1983). Summarises the data available on phase transitions in the actinide oxides and discusses and possible connection with fission-gas release. (14 refs.)
- 112330 On the role of strain and graphite interlayer in clad failure.** S.Mehedinteanu, F.Glodeanu (Inst. for Nuclear Power Reactors, Pitesti, Rumania). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.332-5 (June 1983). The role of a plane-stress state in the clad failure during power transients is examined. Comments are made on the role of graphite interlayer in pellet-clad interaction (PCI) mechanisms. (9 refs.)
- 112331 Flow in a mixed UO_2 -Pu O_2 pile.** C.Milet (CEA, Fontenay-aux-Roses, France), C.Picini. *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.195-9 (June 1983). In French. The flow under compression, of a mixed UO_2 -Pu O_2 file has been studied for stress values equal to or less than 26.5 MPa and temperatures from 500-1100°C. The results show that the rate of flow is proportional to the stress and to the fission rate in the region examined and up to a combustion rate of 4%. On the other hand the existence of a zone of transition from athermal to thermally active at 900°C has been established, and rates of flow have been measured of the same order of magnitude for a stoichiometric fuel (U,Pu) $\text{O}_{2.00}$ and a hypostoichiometric fuel (U,Pu) $\text{O}_{1.97}$ at a temperature around 800°C. (9 refs.) J.S.
- 112332 A new fission-gas release model.** R.J.White, M.O.Tucker (Berkeley Nuclear Labs., Central Electricity Generating Board, Berkeley, England). *J. Nucl. Mater. (Netherlands)*, vol.118, no.1, p.1-38 (Aug. 1983). The release of unstable fission products from irradiated UO_2 fuel is shown to be a sensitive function of many inter-related factors. The poly-granular-aggregate model for unstable gas release assumes that the release of fission products from the interior regions of UO_2 fuel occurs, first by direct diffusion to grain boundaries and, secondly by gaseous diffusive transfer through an intermittently open grain-edge tunnel network. During the early stages of irradiation a saturated network of grain-face lenticular porosity is established by the precipitation of stable fission-gas atoms. Lenticular bubbles which nucleate near to the grain edges—junctions of the three grains—will move to a lower free energy configuration on those edges and take up a triangulated cigar shape. Continued stable gas collection inflates these bubbles to a point of interlinkage beyond which point the fission gases are vented and tunnel collapse, by means of surface diffusion away from regions of high curvature, into a string of cigar-shaped bubbles occurs. A model incorporating the Speight-Turnbull stable gas release model (1969, 1974), the grain edge-corner swelling model and the Tucker-White percolation diffusion model from a polygranular aggregate is shown to account well for the experimental findings of Turnbull and Friskney (1978) on release rates of ^{131}I , ^{133}I , ^{135}Xe , ^{136}Xe , ^{88}Kr from 1.46% enriched stoichiometric UO_2 . (55 refs.)
- 112333 Modelling of fission-gas release from fuel undergoing isothermal heating.** I.R.Brearley, D.A.Macinnis (Safety & Reliability Directorate, UKAEA, Warrington, England). *J. Nucl. Mater. (Netherlands)*, vol.118, no.1, p.68-72 (Aug. 1983). Currently there is controversy surrounding the mechanism of fission-gas release from fuel subjected to transient heating. A recent model (SINGAR) suggests that the release mechanism is principally single-atom migration coupled with thermal resolution of atoms from intragranular bubbles. This contrasts markedly with the previous interpretation of the release in terms of biased gas bubble migration in the presence of a temperature gradient. The extensive release observed during isothermal annealing of irradiated fuel samples is modelled. This is major evidence in favour of the SINGAR model since, in the absence of a temperature gradient, the bubble migration model will predict no release, contrary to observation. (15 refs.)
- 112334 Stress analysis of core support post in a very high-temperature reactor.** K.Kikuchi (JAERI, Ibaraki-ken, Japan), T.Yokobori, K.Sanokawa, Y.Okamoto, T.Yokobori. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.23-31 (1982). [received: Sept. 1983] A very high-temperature gas-cooled reactor (VHTR) has been developed by Japan Atomic Energy Research Institute and its core consists of so-called fuel blocks, removable reflector blocks and so on. These graphite blocks are supported by thin cylindrical graphite bars called support posts. These posts are in contact with the blocks through hemispherical seats to absorb the relative displacement of blocks by small inclination or rotation of the posts. Stress distributions and stress concentration coefficients of the support post under the reactor core weight are analysed by means of photoelastic experiment and compared with two-dimensional calculation by using the finite element method. The following are the conclusions the authors have derived: (1) Stress concentration coefficients of the post are expressed uniquely as function of $Ed(1/r_p - 1/r_s)/\sigma_e$ regardless of the shapes of model and material properties. (2) Inclination of the post caused by small rotation has little effect on the stress concentration coefficients. (12 refs.)
- 112335 Thermoplastic analysis of a sphere-PAC fuel pin.** T.C.Kennedy (Dept. of Mech. Engng., Oregon State Univ., Corvallis, OR, USA), T.L.George, K.L.Peddicord. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.57-65 (1982). [received: Sept. 1983] This analysis is concerned with the thermomechanical response of a sphere-pac fuel pin. The fuel is modeled as an elastic-plastic continuum governed by the Mohr-Coulomb yield criterion and associated flow rule under plane strain conditions. Yielding is found to initiate at the outer edge of the fuel, and a plastic zone progresses inward. When the fuel has completely yielded, there exist three distinct plastic zones corresponding to stress states on different facets of the yield surface. Closed form expressions for the displacement and stresses in each of the plastic zones are presented. Numerical results illustrating the variation of displacement and stress with radial position are given. (11 refs.)
- 112336 Prepare for on-site storage of nuclear radwaste.** R.Beaudry (Detroit Edison Co., Detroit, MI, USA). *Power (USA)*, vol.127, no.8, p.51-4 (Aug. 1983). Faced with the steady disappearance of commercial disposal sites for radioactive waste material, Detroit Edison took matters into its own hands to make provision for the future at Fermi 2. (no refs.)
- 112337 Organisation of inspection of radioactive waste by the public health services.** P.Pellerin, M.-E.Gahinet. *Rev. Gen. Nucl. (France)*, no.3, p.194-203 (May-June 1983). In French. The liquid radioactive waste produced by nuclear plants is subjected to stringent regulations and strict controls by the administration for Public Health. The authors describe the principles underlying these regulations and the procedures and arrangements which they prescribe. They go on to examine the main aspects of the role played by the Central service for protection against ionic radiation (SCPRI) and how inspection of radioactive waste for which it is nationally responsible as part of its official public health vocation in the radioactive protection sector is organised. (9 refs.)
- 112338 Protection and control of nuclear materials: a pressing obligation.** Y.Duvaux. *Rev. Gen. Nucl. (France)*, no.3, p.219-21 (May-June 1983). In French. The author calls to mind the responsibilities of a country with an extensive nuclear programme and the associated increase in quantity of nuclear materials and those who stock them together with the necessity of taking stringent protective and control measures both within its own national territory and on an internal scale. The nature of the threat, the French laws and

regulations and the measures which have been taken are themes which are subsequently examined. (no refs.)

112339 Weld residual stress redistribution near growing cracks. D.F.Quinones, J.E.Reaugh.
Report EPRI-NP-2964, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 86 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
A numerical analysis is presented of intergranular stress corrosion cracking in a residual stress field of the heat-affected zone of a girth-butt weld. A complete preexisting circumferential crack, growing radially outward in a 10-cm schedule 80 recirculation line, is modelled using the elastic properties of BWR type-304 stainless steel. Results from these elastic calculations show that the axial extent of the initial residual stress field has little influence on the stress intensification and crack arrest for extents greater than three pipe wall thicknesses.

112340 Licensing applications and requirements of an ideal steady-state fuel performance code. I.B.Fiero.
Report EPRI-NP-2940, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 38 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
The author identifies and characterizes the licensing applications and requirements for an ideal steady-state fuel performance code. Fifteen licensing applications are examined with respect to specific requirements as set forth in the Code of Federal Regulations, the Nuclear Regulatory Guidelines and the NRC Standard Review Plans. Code input data needs and output requirements for each application as well as necessary models to represent the pertinent fuel behavior phenomena are identified.

112341 Constitutive equations for the creep behaviour of nickel-base alloys for HTR components in the temperature range 1023 - 1273 K. W.Osthoff, H.Schuster, P.J.Ennis, H.Nickel.
Report JUL-1843, Kernforschungsanlage, Julich, Germany (April 1983), 160 pp. In German.
The applicability and modification of constitutive equations for describing the creep and relaxation behaviour of the nickel-base alloys INCONEL 617, NIMONIC 86 and HASTELLOY S have been investigated. Creep tests at stresses in the range 10-150 MPa and temperatures in the range 1023-1273K were carried out for the three alloys and in addition for INCONEL 617 and HASTELLOY S relaxation and stress dip tests in the stress range 10-170 MPa and temperature range 1073-1223K were performed. The fitting of various creep equations to the measured creep curves showed that the best description of the primary and secondary creep regions was given by the equation formulated by Li (1963). (80 refs.)

112342 Experimental investigations of actinide release from coated fuel particles for high-temperature reactors. A.T.e Silva.
Report JUL-1833, Kernforschungsanlage, Julich, Germany (March 1983), 164 pp. In German.
The migrational behaviour of actinides in the coated fuel particles proposed for high-temperature reactors is investigated experimentally. Data are described in the framework of the diffusion model. The experimental procedures are presented and the necessary computer codes are discussed. The diffusion coefficients of the actinides—plutonium, americium and curium—as well as of the fission product cesium are derived from the experimental data by a nonlinear least squares fit procedure and are presented in the form of Arrhenius lines $D = D_0 e^{-Q/RT}$ for U(TH)-O₂, HTI-PyC and SiC. (37 refs.)

112343 Oxidation of Ni-Cr experimental alloys and the effectiveness of the oxide as a barrier against carburization in high-temperature reactor primary circuit helium. U.Thiele, H.Schuster, H.Nickel.
Report JUL-1790, Kernforschungsanlage, Julich, Germany (July 1982), 141 pp.
To study the corrosion mechanisms in the complex gas-metal systems of high temperature reactor (HTR) primary coolant circuits, 26 nickel-chromium experimental alloys have been exposed in different gas compositions. The alloys contained systematically varied Cr, Al, Ti and Si levels. For the first exposure of the specimens (oxidising conditions), the composition of the test gas was selected to give the same oxidation potential as the primary coolant of an HTR by adding to the helium controlled amounts of hydrogen and water. For the second exposure (carburising conditions) methane was added to the test gas to investigate the effectiveness of the oxide in preventing carburisation. The concentrations of the impurities in the test gases were a factor of 100 higher than in the PNP Standard helium, in order to accelerate the reactions, and so shorten the test durations. The results of these experiments were compared with those obtained for the same alloys exposed in PNP Standard helium. (73 refs.)

112344 Management and disposal of alpha-contaminated wastes. A survey of current practices, strategies and R & D activities in some EC countries and the USA. F.Mannone.
Report EUR 8574 EN, Comm. European Communities, Luxembourg (1983), 136 pp.
In view of the rationalization of radwaste pre-treatment, conditioning and storage procedures so far applied at the Ispra Establishment, a survey of alpha-waste management practices and strategies currently in use of under development in some EC countries and US has been carried out. In considering radwastes arising at nuclear research centres, and nuclear plants, the most importance has been here attached to their alpha- rather than to their beta, gamma-contamination degree. Various process technologies currently practised for pre-treatment, conditioning, storage and/or disposal of alpha-waste at several European nuclear centres and plants, as well as at some USDOE laboratories, have been surveyed, including also process operations aimed at recovering Pu, both for economical and ecological reasons. The present alpha-waste management and disposal scenario has been completed by the survey of research, development and demonstration work underway in Europe and USA in this field. Finally, national organizations, policies and strategies for radwaste management and disposal have been briefly outlined. (138 refs.)

112345 Verification of the GFLOW computer code using experimental data from the Maine Yankee spent-fuel storage pool. R.R.Gay, D.M.Gloski.
Report EPRI-NP-3097, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 94 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Presents the findings of a study to validate the GFLOW analytic model as an improved method for performing a thermal-hydraulic analysis of spent-fuel storage pools. In addition, a comparison of calculated results with experimental data taken at the Maine Yankee spent-fuel storage pool is discussed.

112346 Studsvik over-ramp project. S.Djurle.
Report EPRI-NP-3007, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 184 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Documents the results of ramp testing of 39 PWR design fuel rods under fast power increase. Failure thresholds were established within particular groups of rods having nearly identical design and base irradiation history, and the findings are presented. A useful data set on well-characterized rods is provided for nondestructive and destructive examinations. The data include both steady state and transient performance characteristics over a significant range of design and operating conditions.

112347 In-plant low-level radwaste technology needs. R.Baker, F.Feizollahi.
Report EPRI-NP-3117, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 116 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
An industry-wide survey of current low-level radwaste technology, focusing on waste processing and packaging in nuclear power plants, is outlined. A three-part technology improvement program, involving existing waste generation and treatment systems, alternative technologies, and alternative operation and maintenance practice, is proposed, and alternatives for each subprogram are described.

112348 Low-level waste disposal site performance assessment with the RQ/PQ computer program. V.C.Rogers, M.W.Grant, G.B.Merrell, P.J.Macbeth.
Report EPRI-NP-2664, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 76 pp.
Available from Research Report Center, Box 50490, CA 94303, USA.
Presents the RQ/PQ computer program and a pathway analysis for use in screening and selecting shallow-land burial sites for low-level waste (LLW). The code's ability to calculate potential radioactive LLW hazards is discussed as well as the characteristics of natural and man-made barriers caused by the disposal facility. The bases for modelling nuclide releases from nine potential pathways are described and compared with NUREG-0782 methods, and a summary of the equations solved, a FORTRAN listing, and a sample problem's input and output are given.

112349 Summary of methods for conditioning and immobilizing ion-exchange resins. R.A.Speranzini, L.P.Buckley.
Report AECL-7976, Atomic Energy Canada Ltd., Chalk River, Ont. (Feb. 1983), 36 pp.
Ion-exchange resins are used in CANDU-PHW nuclear power stations to purify heavy water in the primary heat transport and moderator systems. Two promising techniques for conditioning spent ion-exchange resins for disposal have been evaluated: direct immobilization and incineration combined with immobilization of the ash and scrubbed off-gases. When ion-exchange resins were immobilized directly, volumes of bitumen products were about 0.75 times the volumes of untreated resin, while the volumes of cement and polyester products were 2 to 3 times larger. While incinerating the resin is an extra processing step, much smaller volumes result from the latter option. Bitumen and glass product volumes were six and ten times smaller, respectively, than the volumes of untreated resin, while cement and polyester product volumes were about one-half the volume of untreated resin. (17 refs.)

112350 Nuclear fuel waste disposal: Long-term stability analysis. G.J.Merrett, P.A.Gillespie.
Report AECL-6820, Atomic Energy Canada Ltd., Chalk River, Ont. (July 1983), 41 pp.
Discusses events and processes that could adversely affect the long-term stability of a nuclear fuel waste disposal vault or the regions of the geosphere and the biosphere to which radionuclides might migrate from such a vault. (45 refs.)

112351 Development of a CVD silica coating for UK advanced gas-cooled nuclear reactor fuel pins. M.J.Bennett, M.R.Houlton (UKAEA, AERE Harwell, Didcot, England), D.A.Moore, A.I.Foster, M.A.M.Swidzinski.
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.395-400
Vapour deposited silica coatings could extend the life of the 20% Cr/25% Ni niobium stabilised (20/25/Nb) stainless steel fuel cladding of the UK advanced gas cooled reactors. A CVD coating process developed originally to be undertaken at atmospheric pressure has now been adapted for operation at reduced pressure. Trials on the LP CVD process have been pursued to the production scale using commercial equipment. The effectiveness of the LP CVD silica coatings in providing protection to 20/25/Nb steel surfaces against oxidation and carbonaceous deposition has been evaluated. (6 refs.)

28.42H Fuel preparation and reprocessing (inc. isotope separation and enrichment)

- 112352 Thorium fuel reprocessing with pulse columns. II. H.Fumoto, E.Zimmer, R.Kiyose, E.Merz (Inst. für Chem. Technol., KFA Jülich, Jülich, Germany). *Atomkernenerg. Kerntech. (Germany)*, vol.41, no.4, p.273-8 (1982). [received: Sept. 1983]
- For pt.1 see Technol., vol.58, p.447 (1982). The acid deficient Thorex process has been investigated in view of concentration profiles along the pulse columns in the co-extraction and the co-stripping procedure. Because of the lower acidity, the acid deficient feed is more suitable for zirconium and less suitable for ruthenium decontamination. In the co-stripping of thorium and uranium, unexpected high uranium concentrations have been observed in the lower part of the column. During the acid deficient feed adjustment, a violent reaction of entrained organic phase with the nitrates has taken place. (14 refs.)
- 112353 Depletion functions and their use in the calculation of isotope transmutations. A.I.Shlyakhter (Leningrad Nuclear Phys. Inst., Leningrad, USSR). *Atomkernenerg. Kerntech. (Germany)*, vol.42, no.1, p.33-8 (1983).
- The basic points in the calculation of transmutations of isotopes are analyzed using the so-called 'deletion functions'. It is shown that conventional criteria used for selecting the most important nuclide chains and for eliminating the short-lived isotopes from them are sometimes misleading. In particular, the usual neglect of the short-lived nuclides may appear to be incorrect. At small irradiation time t the error introduced by this approximation is about $\epsilon \approx (n-2)\lambda_k t$, where n is the number of nuclides in the chain and λ_k is the destruction rate of the neglected isotope. At large t is $\epsilon \approx \lambda_m/\lambda_k$ where λ_m is the lowest destruction rate in the chain. As a result, the error does not tend to zero when t goes to infinity unless at least one nuclide is not depleted at all. Simple formulae for the sensitivity of the calculated nuclide concentrations to the adopted value of nuclear constants are obtained. To illustrate the result the author considers production of actinides. (23 refs.)
- 112354 Reaction of lithium and sodium nitrates and carbonates with uranium oxides. T.Fujino, K.Ouchi, T.Yamashita, H.Natsume (Div. of Chem., JAERI, Tokai-mura, Ibaraki-ken, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.157-65 (June 1983).
- The reactivity and reaction conditions to form lithium and sodium uranates were studied in an attempt to group some useful head-end processes in nuclear fuel reprocessing. In the reactions between alkali metal carbonates and U_3O_8 in air at 800°C, the products with Na/U ratios 0.8 and 0.857 gave

the same X-ray diffraction patterns in which the peaks of $\alpha-U_3O_8$ were almost not detected. The observed peaks for uranates with Li/U=1.205, 2, 4 and Na/U=1 are well consistent with the values reported previously. No indication of formation of $Li_2U_6O_{19}$, Li_6UO_6 and Na_4UO_6 was observed. Thermogravimetric observations on the reactions between the carbonates and U_3O_8 revealed that they consisted of two processes, i.e. (1) the formation of uranates and (2) the oxidation of the uranates formed. The rate of reaction (1) was higher than that of reaction (2) when the M/U (M=Li, Na) ratio was 0.5. When the ratio was 1, the rate of reaction (1) lowered and became rate determining. The reactions between alkali metal nitrates and UO_2 showed that the minimum M/U ratios for obtaining the uranates without U_3O_8 were 0.667 and 0.8 for lithium and sodium uranates, respectively. They were formed by heating at 600°C for 3 h in oxygen or air. Mixing process of initial materials is not required for these reactions. The uranates formed were found to be dissolved in 1 M HNO_3 within 1 min. (27 refs.)

112355 Leaching uranylhydrogel as one of the technological operations of the sol-gel process. I. F.Melichar (Ústav Jaderneho Vyzkumu, Rez, Czechoslovakia). *Jad. Energ. (Czechoslovakia)*, vol.29, no.8-9, p.302-5 (Aug.-Sept. 1983). In Czech.

The paper describes process leaching of gel particles of solid uranyl compounds prepared by the sol-gel method. The possibility of access to the description and interpretation of leaching kinetics of the ballast components containing carbon and nitrogen compounds in the form NO_3^- and NH_4^+ is discussed. The ballast components influence the following consequential operation processes of uranyl xerogel and negatively influence the quality of the resulting uranium dioxide. (7 refs.)

112356 A kinetic model of UO_2 dissolution in acid, H_2O_2 solutions that includes uranium peroxide hydrate precipitation. L.E.Eary (Dept. of Geosci., Pennsylvania State Univ., University Park, PA, USA), L.M.Cathles. *Mettall. Trans. B (USA)*, vol.14B, no.3, p.325-34 (Sept. 1983).

Laboratory experiments have been carried out to determine the dissolution kinetics of UO_2 in the UO_2 - H_2O_2 - SO_4 - H_2O system under conditions similar to those which occur during acid in situ leaching of sandstone uranium deposits. UO_2 dissolution proceeds by an electrochemical reaction at the UO_2 surface. Sulfate ions adsorb onto the UO_2 surface and reduce the rate of UO_2 dissolution by blocking sites of potential oxidation. UO_2^{2+} precipitates as insoluble uranium peroxide hydrate ($UO_4 \cdot xH_2O$), and under even moderate pH conditions can greatly reduce the UO_2 dissolution rate. The overall UO_2 dissolution (including $UO_4 \cdot xH_2O$ precipitation) can be usefully described by a simple kinetic model that considers dissolution and precipitation to be independent processes. The model has the advantage that the dissolution rate at a given temperature is a function only of solution composition and UO_2 surface area. The chemical model can thus be easily combined with fluid flow models to obtain a full chemical-physical model of the leaching of uranium ore in a column experiment or in situ. (20 refs.)

112357 Heavy species of enrichment by pulsed gas diffusion. S.Tanisho, Y.Honjo, N.Wakao (Dept. of Chem. Engng., Yokohama Nat. Univ., Yokohama, Japan). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.43-8 (1982). [received: Sept. 1983]

Heavy species enrichment based on pulsed gas diffusion was tested with a constant volume concentration. The separation factors measured were in good agreement with theory. Enrichment/recovery of heavy species in a constant pressure concentrator is also discussed. (3 refs.)

112358 Neutron physical and thermohydraulic investigations on the fissile fuel production with spallation neutrons. T.Schilling. *Report JUL-1835*, Kernforschungsanlage, Jülich, Germany (March 1983), 67 pp. In German.

In case of an enhanced utilisation of nuclear energy from fission reactors it is necessary to preserve the natural deposits of fissile material. One possibility for this preservation could be the breeding of synthetic fuel by the means of spallation neutrons. The configuration discussed here consists of an integral spallation target/breeding blanket pebble bed of hollow Thorium spheres, which is cooled alternatively with helium gas or liquid sodium or lithium. (25 refs.)

112359 Investigation of the behaviour of TRISO coated UO_2 kernels in the head-end burning and experimental determination of the radioactive contents of irradiated particles. H.-G.Aschhoff. *Report JUL-1857*, Kernforschungsanlage, Jülich, Germany (June 1983), 109 pp.

Because of the introduction of the HTR Low Enriched Uranium fuel cycle, the behaviour of UO_2 TRISO-coated fuel particles was investigated in the various HEAD-END unit operations. The potential impact of this particle design on the HEAD-END unit operations was evaluated. The oxidation behaviour of uncoated UO_2 kernels was characterised in both static and fluidised bed combustion tests. Using unirradiated TRISO-coated UO_2 particles, the radioactive inventory of the SiC coating fragments, which are a waste stream from fluid-bed burning, were determined. The measurements showed that the SiC fragments must be classified as 'long-lived, highly radioactive, alpha-containing' waste, and thus its heat generation rate must be considered. A possible conditioning might be hot-pressing and sintering using a vitreous or ceramic powder matrix. The use of a jet mill to crush the SiC coating after burning of the matrix graphite was investigated. Crushing experiments with unirradiated particles demonstrated excellent efficiency in both coating breakage and kernel-coating separation. Because of this, it is proposed to utilise a jet mill to replace both the roll crushing and secondary burning steps in the reference HEAD-END process. (52 refs.)

28.43 FISSION REACTOR OPERATION

- 112360 Rationale for nuclear reactor control room data displays. R.W.Carson, J.L.Russell, Jr. (School of Nuclear Engng. & Health Phys., Georgia Inst. of Technol., Atlanta, GA, USA). *Ann. Nucl. Energy (GB)*, vol.10, no.9, p.457-65 (1983).
- One of the 'lessons learned' from the Three Mile Island accident focuses upon the need for a validated source of plant-status information in the control room. The utilization of computer-generated graphics to display the reduced readings of the plant instrumentation has introduced the need for a set of guidelines that focuses upon the mental image of plant conditions that the operators receive from viewing the computer monitors. The principles that

govern the design of displays are similar to those employed in the education process because the objective is the same, namely, to transfer information. The philosophy for the development of displays to portray the status of major plant systems bases the level of detail upon the needs of the user. Graphic displays that relate the plant system parameter to the plant systems are recommended along with bar-chart type representations of the relationship between plant parameters and allowable limits. (18 refs.)

112361 A fuzzy-logic approach to HTR nuclear power plant model control. M.Bubak, J.Moscinski (Inst. of Computer Sci. AGH, Cracow, Poland), J.Jewulski.

Ann. Nucl. Energy (GB), vol.10, no.9, p.467-71 (1983). The fuzzy-set theory is used to incorporate linguistic 'rules of thumb' of a human operator in the HTR nuclear power plant controller. The results of the extensive computer simulations are encouraging and confirm the usefulness of this approach in nuclear power plant control. In the Appendix a short introduction to fuzzy logic is given. (11 refs.)

112362 A simple teaching model for transient fuel-cycle analysis. J.D.Lewins (Dept. of Engng., Univ. of Cambridge, Cambridge, England). *Ann. Nucl. Energy (GB)*, vol.10, no.9, p.491-6 (1983). The author presents a 'lumped' model of batch loading fuel in a fission reactor. A linear representation of the increase in fuel utilisation is also made. (3 refs.)

112363 Power oscillations in a reactor with two temperature coefficients. R.S.Poddar, M.S.Trasi, V.Balaraman (Bhabha Atomic Res. Centre, Bombay, India).

Atomkernenerg. Kerntech. (Germany), vol.42, no.2, p.95-100 (1983). Oscillatory behaviour in a nuclear reactor with two temperature feedback is investigated using a perturbation technique. Necessary and sufficient conditions are established for the occurrence of oscillations, for the asymptotic damping, sustenance and divergence of oscillations, as well as for asymptotic stability under oscillatory conditions. Numerical methods are used for verifying the theoretical results and also to investigate the effect of large perturbations on an oscillatory system. (21 refs.)

112364 Simulation of THTR-steam generator control using artificial intelligence methods. J.Kitowski (Inst. of Computer Science, Univ. of Mining & Metall., Cracow, Poland).

Atomkernenerg. Kerntech. (Germany), vol.42, no.2, p.124-5 (1983). The author describes briefly and discusses the enlarged concept of the multi-dimensional heuristic learning controller with dynamic memory organization and linear reinforcement, equipped into multicriterial control ability. This was used for simulation of control of a THTR-steam generator. (8 refs.)

112365 Effect of pre-exposure of films on radiographic sensitivity. J.K.Ghosh, J.P.Panakkal, P.R.Roy (Radiometallurgy Div., Bhabha Atomic Res. Centre, Bombay, India).

Br. J. Non-Destr. Test. (GB), vol.25, no.5, p.238-9 (Sept. 1983). Fogging of films prior to actual radiography in nuclear fuel fabrication facilities using high burn-up recycled plutonium, affects the image quality. An investigation is presented on the effect of the pre-exposure on the radiographic sensitivity of industrial radiographic films evaluated by the use of conventional image quality indicators and micro-densitometry. (1 ref.)

112366 Measurement and evaluation of neutron spectra above 0.1 MeV in the JMTR. K.Sakurai (Div. of Japan Materials Testing Reactor, JAERI, Ibaraki-ken, Japan).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.359-71 (1 Aug. 1983).

The evaluation of fast neutron spectra from the Japan Materials Testing Reactor (JMTR) have been performed by using the critical facility of the JMTR and by a combination of the multi-foil activation method and the adjustment codes (SAND II and NEUPAC). In order to measure and evaluate the neutron spectra above 0.1 MeV, resonance detectors such as manganese, gold and copper have been used to determine the neutron flux level in the 1/E region and threshold detectors such as silver, rhodium, indium, uranium, aluminum, magnesium and titanium have been used to determine the neutron flux level above 0.1 MeV. The guess spectra for the neutron spectrum adjustment were calculated by using the one-dimensional discrete-ordinates code ANISN with the slab model for the JMTR core. Some important points were concluded through the adjustment procedure of the neutron spectrum: the adjusted spectrum from 0.1 to 1 MeV depends on the accuracy of the neutron cross section data for the threshold detectors such as silver and rhodium, and also on the accuracy of these reaction rates. The ratios of neutron flux above 0.183 MeV to neutron flux above 1 MeV were calculated from the guess spectra and the adjusted spectra, and the ratios were in good agreement with each other. (12 refs.)

112367 Post-critical heat flux heat transfer: a survey of current correlations and their applicability. S.W.Wang (Sargent & Lundy Engrs., Chicago, IL, USA), J.Weisman.

Prog. Nucl. Energy (GB), vol.12, no.2, p.149-68 (1983). Post-critical heat flux (CHF) heat transfer is of interest to nuclear engineers because of (a) the need to compute the consequences which immediately follow power in excess of the CHF and (b) the need to be able to determine when adequate cooling has been re-established once CHF has been exceeded. The information reported in this area has often seemed confusing because of the wide variety of conditions which have been considered. What appears as the poor performance of a given correlation is often due to inadvertent use of the correlation outside of the range of its derivation. The various regimes of post-CHF heat transfer pertaining to pool boiling and flow boiling are delineated. The correlations appropriate to each regime are indicated and an attempt is made to assess their utility. (71 refs.)

112368 Hodoscope cineradiography of nuclear fuel destruction experiments. A.De Volpi (Argonne Nat. Lab., Argonne, IL, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.22-9 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

Nuclear reactor safety studies have applied cineradiographic techniques to achieve key information regarding the durability of fuel elements that are subjected to destructive transients in test reactors. Beginning with its development in 1963, the fast-neutron hodoscope has recorded data at the TREAT reactor in the United States of America. Consisting of a collimator instrumented with several hundred parallel channels of detectors and associated instrumentation, the hodoscope measures fuel motion that takes place within thick-walled steel test containers. Fuel movement is determined by detecting the emission of fast neutrons induced in the test capsule by bursts of the test reactor that last from 0.3 to 30 s. The system has been designed so as to achieve under certain typical conditions (horizontal) spatial resolution less than 1 mm, time resolution close to 1 ms, mass resolution below 0.1 g, with adequate dynamic range and recording duration. A variety of imaging forms have been developed to display the results of processing and analyzing recorded data. (6 refs.)

112369 Survey of cineradiographic techniques applied to nuclear reactor safety experiments. A.De Volpi (Argonne Nat. Lab., Argonne, IL, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.30-9 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

After reviewing the role of in-pile and out-of-pile experiments in the United States fast-reactor safety testing program, The history of fuel-motion measurements is sketched. The fast neutron hodoscope is described, with particular emphasis on capabilities and principles of operation. Alternative devices for fuel-motion measurement are examined with a discussion of future improvements in material-motion diagnostics. Relationships of fuel-motion diagnostic techniques to other types of cineradiography are also covered. (22 refs.)

112370 MIRENE, a mini-nuclear reactor for neutronography—data and applications. M.Houelle, J.M.Gerberon (CEA, Tille, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.262-9 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

MIRENE is described and its characteristics are given. The core uses only 1 kg of enriched uranium in solution state. It works in a self-limited pulse mode. The neutron pulses are collimated in two beams which cross the concrete protection walls surrounding the reactor. Many applications of MIRENE in different fields are indicated. In nuclear engineering: testing of first neutron reactor fuel-pins; control of 'neutrophage screens' used in transport and storage of nuclear-fuel materials to secure the criticality-safety; observation of irradiated-oxide samples in order to determine the equation of state of the fuel used in fast-neutron reactors; observation of $\text{UO}_2\text{-H}_2\text{O}$ mixing conditions in the field of criticality experiments. In engineering, MIRENE has a large field of applications, two examples are given: the control of the sealing of an electric isolator; the visualization of the bonding layer between two high density metals. Finally an original application in agronomy is shown which has given very good results: the observation of the in-situ growth of a corn-root. (2 refs.)

112371 Development of key components for the heat transport system of prototype fast breeder reactor 'MONJU'. H.Ogasawara (Hitachi Works, Hitachi Ltd., Tokyo, Japan), A.Suzuoki.

Hitachi Rev. (Japan), vol.32, no.2, p.105-10 (April 1983). [received: Aug. 1983]

The heat transport system for the prototype fast breeder reactor 'MONJU' comprises a reactor vessel, intermediate heat exchangers for heat exchange between primary and intermediate sodium, steam generators for heat exchange between intermediate sodium and water/steam, main pumps for sodium circulation and pipings, etc. These components are required to absorb severe thermal shocks and expansions in high-temperature sodium environments. In order to improve the reliability of these components, extensive research and development programs are under way in the field of heat transfers and flow characteristics, materials, structures, strength evaluations, manufacturing and inspections. The paper describes the status in development of the intermediate heat exchanger, the primary main sodium pump and the steam generator, all of which are now under development by Hitachi Ltd, for 'MONJU'. (6 refs.)

112372 The development of high-temperature fission-counter chambers for nuclear-reactor control and protection. T.Tomoda, S.Fukakusa, S.Yamashita, N.Wakayama, H.Yamagishi.

Mitsubishi Denki Giho (Japan), vol.57, no.4, p.21-5 (1983). In Japanese.

The instrumentation for fast-breeder reactors, high-temperature gas reactors, and similar n-w reactors requires neutron detectors capable of operating at high temperatures. The authors have succeeded in developing fission-counter chambers possessing both improved operating characteristics and high heat resistance. The measurement range of these chambers is wide enough to cover all reactor conditions from start-up to full power. Measurements using them show no temperature dependence, and the chambers can withstand long-term operation at temperatures up to 600°C. In addition, the narrow, 100 ns pulse width enables neutron measurement to be performed under gamma-ray dosages of up to 10⁶R/h. (8 refs.)

112373 An investigation into the nature and significance of a new critical heat flux correlation. W.J.Green, D.R.H.Beattie (AAEC Res. Establ., Lucas Heights Res. Labs., Sutherland, Australia).

Nucl. Eng. & Des. (Netherlands), vol.75, no.1, p.33-41 (1982). [received: Sept. 1983]

An empirical critical heat flux correlation, which is based upon dimensionless groups, and which was developed from a wide range of experimental data for vertical upflow in uniformly heated tubes, has been further examined to determine if, because of its accuracy and generality, it might provide an insight into the mechanisms of boiling crisis. A parameter survey using the correlation showed that it was well able to predict the so-called 'crisis of the second kind' without needing to define any separate or distinct flow regimes. Comparison of the empirical correlation with a general form of theoretical correlation, developed from a combination of several simple physical models which occur during the crisis phenomenon, shows a strong similarity in the form of the dimensionless groups. It also indicates that a further dimensionless group may need to be incorporated in the empirical correlation to achieve complete generality. Rearrangement of the dimensionless groups, and the form of the empirical correlation, together with some minor approximations, indicate that boiling crisis is influenced by local hydrodynamic and thermal phenomena and can be related to pre- and post-crisis coolant conditions. (13 refs.)

112374 The prediction of critical mass flux by the use of Fanno lines. E.E.Michaelides, S.Parikh (Mech. & Aerospace Engrg., Univ. of Delaware, Newark, DE, USA).

Nucl. Eng. & Des. (Netherlands), vol.75, no.1, p.117-24 (1982). [received: Sept. 1983]

Fanno lines have been used extensively for the prediction of the critical flow in homogeneous single phase fluids. The authors attempt to apply this method for the prediction of critical flow in a two-phase evaporative fluid. Homogeneous and slip conditions are examined for water-steam flow. The criterion of critical flow is set as the turning point of the constant mass flow rate line in the entropy-enthalpy diagram. The proposed criterion gives very good agreement of the critical mass flux with experimental data, and with previous models on critical flows. (16 refs.)

112375 FBR wide-range neutron monitoring system. I.Tai, E.Seki, M.Sakamoto, T.Sakuma (Toshiba Corp., Kawasaki, Japan).

Toshiba Rev. (Int. Ed.) (Japan), no.143, p.11-13 (Spring 1983).

A new and practical wide-range neutron monitoring system for the fast breeder reactor was developed. The system can monitor all neutron flux levels from the startup to power range operation with only one neutron detector. This system was experimentally applied to the experimental RBR, JOYO. Its characteristics have been proved to be satisfactory and practical for reactor power monitoring based on application tests at JOYO. The realization of this

system is due to a new high performance preamplifier which was developed and manufactured by Toshiba. (2 refs.)

112376 Reactor physics and economic aspects of the CANDU reactor system.

Report AECL-7615, Atomic Energy Canada Ltd., Chalk River, Ont. (Feb. 1983), 269 pp.

Contains the material presented in nine lectures at the National School of Physics at Yogyakarta, Indonesia, 1981 November 9 to November 13. A history of the development of the CANDU system is given along with a fairly detailed description of the 600 MW(e) CANDU reactor. Reactor physics calculation methods are described as well as comparisons between calculated reactor physics parameters and those measured in research and power reactors. An examination of the economics of CANDU in the Ontario Hydro system and a comparison between fossil fuelled and light water reactors is presented. Some physics, economics and resource aspects are given for both low enriched uranium and thorium fuelled CANDU reactors. Finally the R&D program in Advanced Fuel Cycles is briefly described. (14 refs.)

112377 Evaluation of techniques to predict flow-induced tube vibration in a preheat steam generator. J.H.Stuhmiller, R.E.Ferguson, J.H.-Y.Yu, P.J.Masiello, C.J.Chuong.

Report EPRI-NP-2986, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 120 pp.

Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.

A mathematical modeling methodology is presented for combining steam generator geometry and operating conditions with structural and fluid dynamics in order to predict the location and severity of flow-induced tube vibration damage in a preheat generator. A description of the successful three-step mathematical technique is provided, and predictions are compared with the trends of laboratory data on separate effects and with field observations of damage.

112378 Thermal mixing in a model cold leg and downcomer at low flow rates. P.H.Rothe, M.W.Fanning.

Report EPRI-NP-2935, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 490 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

An experimental program of fluid mixing experiments performed in a 1/5-scale mixing facility to evaluate the effects of low flow rate and the thermal shield on the fluid and thermal mixing phenomena in the cold leg and downcomer of certain specified PWRs is described. Simulated steady-state conditions thought to be extreme for small-break loss-of-coolant accidents are analyzed, and details of the analysis of transient and steady-state temperature records documenting the mixing of the cold high-pressure injection coolant water and the hot primary coolant water are provided.

112379 Hydrazine usage for corrosion control in PWR plants with powdered resin condensate polishers. J.L.Barkich, P.J.Battaglia.

Report EPRI-NP-2969, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 44 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

The authors document the testing performed at North Anna Unit 2 to obtain the data necessary to determine the optimum injection point and amount of hydrazine to be used for oxygen control in PWR units with condensate polishing demineralizers. Conclusions and recommendations are presented.

112380 Diffusion and hideout in crevices. J.G.Cleary, G.E.Von Nieda, W.T.Lindsay, Jr..

Report EPRI-NP-2979, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 194 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

An investigation to identify and formulate the important variables that control contaminant hideout in and return from severely dented support plate crevices in steam generators is summarized. The results of the investigation are presented in four specific areas: (1) a literature review and estimation of diffusion coefficients for electrolytes in hot water, (2) an experimental study of diffusion rates through simulated crevice packing, (3) a study of contaminant hideout rates as a function of applied heat flux, and (4) the development of a mathematical model.

112381 Primary-side deposits on PWR steam generator tubes. C.A.Bergmann, J.Roesmer, D.W.Perone.

Report EPRI-NP-2968, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 82 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.

Analyses conducted to determine the chemical nature of the oxide deposits on the primary side of steam generator tubing samples taken from eight nuclear plants and the radioisotopes incorporated in those deposits are described. Results of the analyses, which included radiochemical, chemical, scanning electron microscope, and energy dispersive X-ray techniques, are presented, and an evaluation of the data obtained and a comparison with in-core crud data and with values calculated by a mathematical activity transport model are provided.

112382 Numerische Untersuchung der 3-dimensionalen stationären Temperatur- und Stromungsverteilung im Core eines Kugelhaufen-Hochtemperaturreaktors (Numerical investigation of the 3-dimensional steady-state temperature - and flow-distribution in a pebble bed high temperature reactor core). K.Verfondern.

Report JUL-1826, Kernforschungsanlage, Jülich, Germany (Jan. 1983), 130 pp. In German.

This work presents a computer model determining the steady-state temperature- and flow field in 3 dimensions in the core of a pebble bed high temperature reactor. The numerical sprinkler method, basing on the THERMIX-model, allows to describe the thermo-hydraulics of a nonrotational-symmetric core-geometry. The AVR-reactor in Jülich, in operation since 1967, represents a suitable investigation-object for the computer model of THERMIX-3D. It is in a 3D-mesh-structure to reproduce very precisely the so called 'graphite noses', in which the shut-down rods are conducted as well as the filling cones in the inner and outer area. The results of the final calculation of the normal operation condition for the AVR-reactor unambiguously show, that within the core reproduced in 3 dimensions there are evident deviations in the flow profile and in the temperatures of the cooling gas in contrast to a 2D-handling. (19 refs.)

112383 Experimental investigation for the thermohydraulics of packed beds in the comparison with the computer code THERMIX-2D: The investigation of the dispersive heat transfer examined by a cold gasstream. M.Schurenkramer, H.Barthels.

Report JUL-1839, Kernforschungsanlage, Jülich, Germany (April 1983), 34 pp. In German.

The computer code THERMIX-2D is tested with regard to the formalism for the effective heat conductivity by experimental data. Especially the part of dispersion is investigated. In addition to the heated main stream a cooler gas

stream is injected into the center of the packed bed. The thermal compensation is measured and calculated. (12 refs.)

112384 Assessment of control rooms of nuclear power plants. L.Norros, J.Ranta, B.Wahlstrom.

Report 184, Tech. Res. Centre Finland, Electr. Eng. Lab., Espoo (May 1983), 29 pp.

To identify and correct the lacks in control rooms of operating nuclear power plants and plants under construction an extensive program has been started in the USA. In Finland as in other countries using nuclear power, the development in the USA particularly with regard to the requirements imposed on nuclear power plants is carefully followed. The changes in these requirements are sooner or later also reflected in the guidelines given by the Finnish authorities. It is therefore important to be able to form a notation of how the new requirements apply to Finnish conditions. Especially it is important to review the latest assessment guidelines for control room implementation (NUREG-0700). Thus one can avoid possible overhasty conclusions. (10 refs.)

112385 NBS reactor: Summary of activities July 1981 through June 1982.

Report NBS-TN-1178, Nat. Bur. Stand., Washington, DC, USA (June 1983), viii+222 pp.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1981 through June 1982. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics and neutron standards to sample irradiations for activation analysis, isotope production, radiation effects studies, neutron radiography, and nondestructive evaluation.

112386 Secondary water chemistry at Millstone 2. T.A.Putkey, W.L.Pearl, S.G.Sawochka.

Report EPRI-NP-2974, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 112 pp.

Available from Research Reports Center, Box 50490, Palo Alto, CA 94303, USA.

Summarizes secondary-system chemistry and steam generator corrosion observations at the Millstone 2 PWR. A review of plant design characteristics, construction materials, and historical water chemistry performance is presented.

112387 On-line use of chelants in nuclear steam generators - Feasibility study. C.R.Wolfe, M.Ambrosino, Jr., W.M.Connor.

Report EPRI-NP-2973, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 190 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

A test program designed to determine the feasibility of using an on-line application of chelants in nuclear steam generators is detailed. The report includes (1) the results of tests involving a recommended chelant formulation with selected pH control additives and (2) the applicability of these tests to the field situation.

112388 Evaluation of steam generator fluid mixing during layup.

A.D.MacArthur.

Report EPRI-NP-2993, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 324 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

A project to develop practical methods of achieving an adequately mixed chemical environment on the secondary side of PWR steam generators during periods of shutdown, cold shutdown (layup), and startup is summarized. Systems for chemical feed, mixing, sampling, and removal of contaminant chemicals in the steam generator secondary side are evaluated, and recommendations are made. Test results from a Plexiglas model indicate that forced circulation and turbulent mixing are the most effective methods of achieving a rapid, homogeneous chemical environment.

112389 Condensate polisher resin leakage quantification and resin transport studies. C.C.Stauffer, P.L.Doss.

Report EPRI-NP-2981, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 240 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

The results are presented of a study conducted at nine operating PWR power plants to quantify the resin released to the secondary cycle from the condensate polisher systems and to determine resin transport throughout the secondary cycle. The results indicate that polisher systems, of both the powdered resin and deep-bed cycle, release some resin, the quantity being largely a function of flow transients on an individual polisher vessel.

112390 Implementation of boric acid in the field - Indian Point Unit 3 plant. B.J.Jusino.

Report EPRI-NP-3066, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 496 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Details the results of a field test of the use of boric acid to arrest steam generator denting. The results indicate that although denting had continued, it had progressed at a significantly slower rate than the immediate period before the boric acid treatment. An on-line hydrogen monitoring technique and steam generator inspections were used to determine the baseline condition of the steam generators and to provide an indication of the rate of denting progression. The effect of boric acid on corrosion products transported through the secondary system was also monitored.

112391 Time-resolved neutron radiography of reactor fuel. A.DeVolpi (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.661-9.

Under the US DOE fast-reactor safety program, fuel pins placed in a test container are irradiated to destruction at the TREAT reactor in Idaho. A diagnostic device called the fast-neutron hodoscope has been developed to generate time-resolved neutron radiographs of the fuel-destruction. The hodoscope records cineradiographic digital-data images of fuel motion during a transient experiment, which could be as brief as a few-hundred milliseconds or as long as a few minutes. Fission induced in the fuel produces fast neutrons that are collimated and detected by a multichannel array. Time resolution in the order of a millisecond is required during much of the power range of the transient. Vertical fuel-motion resolution of about half a centimeter and horizontal resolution of a millimeter or less can be achieved over an area of 6.6×121 cm. A very important and unusual feature of the hodoscope diagnostic system is the capability for data to be quantitatively analyzed in terms of mass of redistributed fuel. (6 refs.)

112392 Underwater neutron radiography facility utilizing small neutron generator. G.Matsumoto, K.Okubo, S.Doi (Nagoya Univ., Nagoya, Japan). Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.699-706. To investigate the feasibility of applying portable neutron generator for neutron radiography (NRG), an underwater NRG facility was designed and fabricated. This is the preliminary stage of a facility which will be designed for non-destructive test of spent reactor fuels in a spent-fuel pond. Using the scintillation converter at the NRG facility, it took about ten min. to take a NRG image. (no refs.)

112393 How good is nitrocellulose film for neutron radiography? J.C.Domanus (Nuclear Dept., Elsinore Shipbuilding & Engng. Co. Ltd., Helsingør, Denmark).

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.729-36. A comparison was made of radiographic quality and sensitivity of neutron radiographs taken on silver halide and nitrocellulose film. For the quality comparison a special calibration fuel pin was used, containing calibrated fuel-to-clad gaps between the UO_2 pellets and zircaloy cladding tube. The neutron radiographs of this pin were assessed by three observers for radiographic image quality referred to X-ray radiographs of the pin. The radiographic sensitivity was investigated with ASTM E 545 sensitivity indicators and assessed in the same way as the calibration fuel pin. Results of the quality and sensitivity assessment done for the nitrocellulose film were compared with those for the silver halide film used in the direct and transfer neutron radiography of the same objects. (8 refs.)

112394 Time delay estimation: application to flow rate measurement of cooling fluid in nuclear power plants. J.-M.Favennec, B.Gergel (Electricite de France, Chatou, France), J.Masson.

Proceedings of ICASSP 82. IEEE International Conference on Acoustics, Speech and Signal Processing, Paris, France, 3-5 May 1982 (New York, USA: IEEE 1982), p.379-82 vol.1

Precise measurement of the coolant flow rate is of utmost importance for the control and safety of PWR nuclear power plants. In this paper several methods based on generalized cross-correlation of γ -radioactivity signals are tested. The authors examine the influence of hydrodynamical parameters such as velocity profile and turbulence on the measurement. It is shown that recently proposed sophisticated estimates (PHAT-SCOT) are not efficient for the purpose and that the Hannan-Thomson (HT) estimate is just slightly better than classical cross correlation (CC). (8 refs.)

112395 Models for calculating the mass flow of a two-phase system on the basis of measured density and momentum flux values. H.Frohlich, E.Siefert (Battelle-Inst. e.V., Frankfurt, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.1, p.11-15 (1983). Several analytical functions have been developed which allow the closed form determination of the two-phase mass flow across a pipe cross-section by using an integral measurement of the density with a 3-beam- γ densitometer and a quasi-pointwise measurement of the momentum flux with dragbodies. Quadratic, cosine and arctangfunctions have been examined for their applicability as profile functions. The suitability of the proposed has been tested against measured blowdown data at the HDR facility and it is demonstrated that the proposed method consistently reproduces the profiles for annular and stratified flow regimes within the experimental limits of error. (10 refs.)

112396 Investigations of the system behaviour of a pressurized-water reactor during loss-of-coolant accidents. The PKL experiment. D.Hein, K.Riedle (Kraftwerk Union AG, Erlangen, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.1, p.19-27 (1983). In German.

The authors describe tests on pressurized-water-reactor system behaviour during a loss-of-coolant accident with the PKL test facility. These tests, carried out in a scaled-down model (1:134) of a 1300-MW reactor, have yielded a large amount of experimental data and supporting evidence for the efficiency of emergency core-cooling systems in the case of a large break. Tests dealing with loss of coolant following a small break concentrated on energy transport mechanisms from the core to the steam generators at different water inventories. (9 refs.)

112397 Variation of evaporation rate for a dynamic flow of water on stainless steel and aluminium rods. M.A.Bayoumi, M.E.Nagy, M.E.Sawan, G.A.Abu-Zaid (Arab Maritime Transport Acad. Engng. Dept., Alexandria, Egypt).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.1, p.55-7 (1983).

The experimental study has been carried out for investigating the parameters affecting the evaporation during an emergency cooling by bottom flooding in a loss of coolant accident (LOCA). The experiments have been done at different values of inlet subcooling, and initial surface temperatures for aluminium and stainless steel 304. For the same initial surface temperature and below the sputtering-Leidenfrost region, increasing of the coolant temperature increases the evaporation rate. Above the sputtering-Leidenfrost region, this relation is reversed. (5 refs.)

112398 Investigations of the reflood-phase after a loss-of-coolant-accident of an advanced pressurized water reactor (APWR). S.Schumann, W.Oldekop (Inst. für Raumflugtech. und Reaktortech., Tech. Univ. Braunschweig, Braunschweig, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.2, p.80-91 (1983). In German.

Differences between a high converting advanced pressurized-water reactor (APWR) and a conventional PWR, which are relevant to the reflood-phase after LOCA are presented. The used code and its verification by PWR-reflood experiments is explained. Comparative calculations for APWR and PWR with several conservative assumptions for example cold-leg-injection only, yield nearly the same maximum midplane-temperatures for the average-channel. For the APWR, however, the upper half of the rod shows higher temperatures. Quenchfront and core-water-level increase more slowly. The differences in the reflood-thermohydraulics are analysed in detail. A conservative hot-channel calculation shows maximum temperatures of about 920°C. Finally the influence of conservative assumptions is described and the necessity of experiments pointed out. (39 refs.)

112399 Simple analysis of very long term processes without operational and emergency energy supply in the PWR power plant. S.Benedek (Inst. for Electrical Power Res., Budapest, Hungary).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.2, p.91-4 (1983). Published calculational methods are cited and used for examination of PWR transients after a loss-of-coolant accident. For different sizes of breaks and breakdown of the pumps the long term transients—without operational and emergency power supply—were calculated. The results show the critical time interval until the operational or emergency/safety water pump/supply should be made into operation to avoid the core heat-up, melt down and the large radioactive issue. (27 refs.)

112400 Loss-of-coolant accident in the fluidized bed nuclear power reactor. F.Sefidvash (Dept. de Engenharia Nuclear, Rio Grande do Sul Univ., Porto Alegre, Brazil).

Atomkernenerg. Kerntechnik. (Germany), vol.42, no.2, p.125-6 (1983).

For the purpose of developing an independent national nuclear technology and an effective manner of transferring such a technology, as well as developing a simple and safe nuclear power reactor, a reactor system based on fluidized bed concept is under study. A preliminary analysis of the loss-of-coolant accident (LOCA) for this reactor is presented. (5 refs.)

112401 The ignition and burning behaviour of sodium metal in air. R.N.Newman (Berkeley Nuclear Labs., CEBG, Berkeley, England).

Prog. Nucl. Energy (GB), vol.12, no.2, p.119-47 (1983).

A review has been made of the ignition and combustion of sodium, both in terms of the fundamental chemistry and also with reference to its use as the heat transfer fluid of a fast breeder reactor. In the discussions of both the combustion chemistry and the scientific mechanisms of possible fire extinguishants comparisons are made with the burning of hydrocarbon fluids. A large part of the review is devoted to the considerable amount of quantitative data produced by various agencies in the world in their pursuit of commercial fast reactor technology. Both practical and theoretical studies have been carried out, some on a large scale, mainly in the field of spray fires and pool fires. Vapour combustion is briefly discussed as is the subject of passive and active fire extinction and possible corrosion damage to structures. Some suggestions are made as to which areas are adequately understood and which areas need significant further work in the context of sodium cooled fast reactors. (87 refs.)

112402 Analysis of parameter changes in the medium of the protective shield of a nuclear reactor after introducing a heat carrier to it. V.V.Fisenko, A.V.Alferov, V.V.Tosheva.

Izv. VUZ Energ. (USSR), no.6, p.59-63 (June 1983). In Russian.

A method is developed for calculating the rate of change of parameters of a water-air mixture in the protective shield of a reactor, for an arbitrary phase state of the water component. By introducing into the design formulae a thermodynamically balanced sound velocity and the Gruneisen factor, it is possible to evaluate directly the rate of change of the pressure, which is an important parameter in the estimation of the strength of the shield. The design formulae have an explicit significance, permitting a relatively straight

forward qualification and quantitative assessment of the process. (3 refs.)

112403 The Qualification Testing Evaluation (QTE) Program: NRC-sponsored research on safety-related equipment qualification methodologies. L.L.Bonzon (Sandia Nat. Lab., Albuquerque, NM, USA). *ISA Trans. (USA)*, vol.21, no.3, p.37-43 (1982).
The nuclear power industry is required to demonstrate that certain safety-related equipment is 'qualified' and will function even in the event of a severe reactor accident. Qualification testing of safety-related equipment must be demonstrated to be both realistic and conservative. The Nuclear Regulatory Commission is sponsoring the Qualification Testing Evaluation Program with the goal of obtaining data that will confirm or improve the technical bases for equipment qualification programs. This paper presents selected examples of results to illustrate the broad scope of research. (21 refs.)

112404 Measurement of vibrations caused by leakages between pressurized circuits during the 30 MW Czech, modular steam generator operation at BOR 60. O.Matal, J.Kunovsky, F.Varvarovsky, J.Rybnycek (Vyzkumny Ustav Energetických Zarizení, Brno, Czechoslovakia). *Jad. Energ. (Czechoslovakia)*, vol.29, no.8-9, p.311-15 (Aug.-Sept. 1983). In Slovenian.
The authors summarize and comment on chosen results of vibration measurements of accelerometers located in three places of a branch of the Czechoslovak modular 30 MW steam generator operating at the BOR 60 facility. (9 refs.)

112405 Concerning the Rayleigh-Ritz treatment of Flugge's equations. J.Bremer (Phys. Chem., Univ. of Sydney, New South Wales, Australia). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.1-3 (1982). [received: Sept. 1983]
Formulae for cross product integrals of Euler-Bernoulli functions are presented. It is established that cross products between derivatives are not orthogonal, and the implications are discussed in terms of an earlier Rayleigh-Ritz treatment of Flugge's equations (1973). (7 refs.)

112406 Analytical method for solving fluid-structure interactions in BWR pressure suppression pool. I.Namata, Y.Kukita, I.Takeshita (JAERI, Ibaraki-ken, Japan), Y.Shimoda. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.5-11 (1982). [received: Sept. 1983]
An analytical method is developed for solving the fluid-structure interactions (FSI) associated with hydraulic transients in the BWR pressure suppression pool during a hypothetical loss-of-coolant accident. The present method assumes inviscid and infinitesimal motion of pool water for which the governing fluid-dynamic equation reduces to a linear wave equation with inhomogeneous boundary conditions of flexible pool boundaries. The present method is applied to quantitative evaluation of the FSI effect on test data obtained from a large scale pressure suppression test which was performed to investigate the pressure oscillations in the pool induced by unstationary steam condensation. (8 refs.)

112407 A study of risk reduction for some mitigation features for PWRs. M.Gonzales-Cuesta, D.Okrent, W.E.Kastenbergh (Dept. of Mech. & Structures, Univ. of California, Los Angeles, CA, USA). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.13-22 (1982). [received: Sept. 1983]
The risk reduction attainable with mitigation features in a large-dry pressurized water nuclear reactor (PWR) is evaluated. The calculations are made in a probabilistic risk analysis framework, and they are based on Zion Probabilistic Safety Study. Some of the modifications made to this study are also taken into account. The mitigation designs considered consist of features for simultaneously controlling late containment overpressure, containment basement penetration, and hydrogen burning. The individual mitigation features include: a passive containment heat removal system (PCHRS), a filtered-vented containment system (FVCS), a core ladle, and controlled hydrogen burning. Emphasis is placed on comparison of PCHRS and FVCS design options. The results include calculations of the sensitivity to several failure mode probabilities and to the probability of core meltdowns with containment bypass. (9 refs.)

112408 A study on sodium spray combustion. R.Kawabe, A.Suzuoki, A.Minato (Energy Res. Lab., Hitachi Ltd., Hitachi-shi, Japan), N.Sagawa, S.Sakaguchi. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.49-56 (1982). [received: Sept. 1983]
Sodium spray combustion was studied through experiments and analysis, in order to clarify the burning rate, pressure and temperature transients in a sodium spray fire. In the experiments, about 400 g sodium was sprayed in a closed vessel of 2 m³, containing nitrogen and 0.21 vol.% oxygen. Pressure, temperature and oxygen concentration were measured during and after sodium injection. The experimental results revealed that the temperature in the spray outer region was higher than that of inner region and observed oxygen consumption was not more than 80% of that expected for complete combustion of sodium. Two analyze the experiments, a computer program SOFIA-II was developed based on an analytical single droplet combustion model and a two-dimensional temperature and oxygen concentration distribution model in the vessel. The calculated pressure agreed with the experimental pressure on the whole and the peak pressure difference was within 10% error. (no refs.)

112409 Liquid solidification in laminar tube flow with internal heat sources. Y.Kikuchi, Y.Shigemasa (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.73-80 (1982). [received: Sept. 1983]
The effect of liquid solidification (freezing) on the heat transfer characteristics for laminar flow of a heat-generating fluid in a cooled circular tube is investigated analytically. Steady-state conditions and a uniform wall temperature, which is lower than the liquid freezing temperature, are assumed. The radius of the liquid-solid interface and local Nusselt number are determined as a function of position along the tube for several different values of the wall temperature and internal heat-generating rate. The thickness of the solid-phase shell increases with distance down the tube and approaches to its fully developed value depending upon a single dimensionless freezing parameter which measures the relative rate of external cooling and internal heating. The local Nusselt number, however, first decreases rapidly, attains a minimum and then increases towards its fully developed value, which is identical with 6. (11 refs.)

112410 Film boiling from a vertical jet of fuel entering a water pool. S.H.Han, S.G.Bankoff (Chem. Engng. Dept., Northwestern Univ., Evanston, IL, USA). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.81-6 (1982). [received: Sept. 1983]
The rate of removal of coolant is examined by means of quasi-steady film boiling from a jet of fuel falling into a water pool during a core meltdown accident in a light water reactor. A two-layer turbulence model in the vapor film is used. Entrainment of droplets due to the high vapor velocity is taken into account, which, for a jet of diameter 0.5 m, increases the removal rate by factor of 5 at 0.7 m behind the leading edge. However, the water removal rate is only of the order of kilograms/second, and the total amount of coolant removed is still small compared to the coolant inventory in the lower plenum. (14 refs.)

112411 Void fraction under high pressure, low flow conditions in rod bundle geometry. T.M.Anklaam (Engng. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), R.F.Miller. *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.99-108 (1982). [received: Sept. 1983]
Void-fraction data are reported from a series of high pressure, low heat and mass flux experiments. Testing was performed in a heated vertical rod bundle with internal dimensions similar to a PWR fuel bundle. The results are of interest in analyses of small break loss of coolant accidents. The experiments showed that, at a given pressure, void-fraction data could be fitted to a drift-flux equation with a constant drift-velocity. The drift-velocity was observed to decrease with increasing pressure and was independent of void fraction; a characteristic normally associated with churn-turbulent flow. However, relevant drift-flux correlations found in the literature gave relatively poor predictions of void fraction. The best predictions were obtained from an empirical correlation based on dimensional analysis. (11 refs.)

112412 Component failure model dependent on time and causes. T.Matsuo (Ship Res. Inst., Nuclear Ship Div., Min. of Transport, Tokyo, Japan). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.109-16 (1982). [received: Sept. 1983]
Presents a failure model in which the failure rate is a function of cause, of severity of cause, of cause acting duration, and of failure mode. This model was constructed in order to treat the effects of an extreme environmental condition and the common mode failure on system reliability. Causes were classified into two types and failure modes in three types. The expressions of failure probabilities were obtained for combinations of these cause and failure mode types. This model was compared with failure data. The time dependence was well expressed by the α th power of time. The values of α were obtained in the range from 0 to 8. (12 refs.)

112413 The probability of a tornado missile hitting a target. J.Goodman, J.E.Koch (Bechtel Power Corp., Norwalk, CA, USA). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.125-55 (1982). [received: Sept. 1983]
It is shown that tornado missile transportation is a diffusion Markovian process. Therefore, the Green's function method is applied for the estimation of the probability of hitting a unit target area. This probability is expressed through a joint density of tornado intensity and path area, a probability of tornado missile injection and a tornado missile height distribution. (10 refs.)

112414 Transient analysis of glowdown thrust force under PWR LOCA. T.Yano, N.Miyazaki, T.Isozaki (Tokai Res. Establ., JAERI, Ibaraki-ken, Japan). *Nucl. Eng. & Des. (Netherlands)*, vol.75, no.1, p.157-68 (1982). [received: Sept. 1983]
The analytical results of blowdown characteristics and thrust forces were compared with the experiments, which were performed as pipe whip and jet discharge tests under the PWR LOCA conditions. The blowdown thrust forces were obtained by Navier-Stokes momentum equation for a single-phase, homogeneous and separated two-phase flow, assuming critical pressure at the exist if a critical flow condition was satisfied. The following results are obtained: (1) The node-junction method is useful for both the analyses of the blowdown thrust force and of the water hammer phenomena. (2) The Henry-Fauske model (1971) for subcooled critical flow is effective for the analysis of the maximum thrust force under the PWR LOCA conditions. The jet thrust parameter of the analysis and experiment is equal to 1.08. (3) The thrust parameter of saturated blowdown has the same one with the value under pressurized condition when the stagnant pressure is chosen as the saturated one. (4) The dominant terms of the blowdown thrust force in the momentum equation are the pressure and momentum terms except that the acceleration term has large contribution only just after the break. (15 refs.)

112415 Ten years of nuclear safety in France: administrative action. C.de Torquat (Min. de l'Industrie et de la Recherche, Paris, France). *Rev. Gen. Nucl. (France)*, no.3, p.187-93 (May-June 1983). In French.
Having recalled the general principles on which administrative action concerning nuclear safety has been based the author goes on to describe the three-principal and complementary aspects of this action: technical regulations; administrative procedure; inspection of plant being constructed or already in operation. Regarding nuclear safety, administrative action over the last ten years in France has focused on examining these three aspects in great depth. (no refs.)

112416 The importance of research for progress in nuclear safety. P.Tanguy, J.Pelce (Inst. de Protection et de Surete Nucleaire, Paris, France). *Rev. Gen. Nucl. (France)*, no.3, p.215-18 (May-June 1983). In French.
The authors describe the research programmes conducted in France with a view to laying down necessary safety arrangements which can be applied to nuclear reactors. They examine the case of light water reactors and then that of rapid neutron reactors. Results of studies up to the present show that the safety margins adopted are basically always valid. Although certain weaknesses have been highlighted (the accident at Three Mile Island is an example) this does not mean that the basic rules for reactor design need be questioned, say the authors. (no refs.)

112417 A study using the MABEL-2C code of the effects of pellet and cladding asymmetries on PWR fuel rod deformation under conditions relevant to the NRU MT-3 ballooning experiment. T.J.Haste. *Report ND-R-876 (S)*, UKAEA, Risley, Lancs., England (April 1983), 76 pp. Available from HMSO, London, England.
The presence of asymmetries in the positions of the fuel pellet stack with respect to the cladding, and of the rods with respect to each other, in PWR fuel bundles has a dominant effect in reducing the amount of strain and hence channel blockage under loss-of-coolant accident conditions. Multi-rod experiments in- and out-of-reactor show wide distributions in burst strain amongst the rods, indicating marked variations in heat source/cladding and rod-to-rod asymmetries. This phenomenon has been studied in detail using the MABEL-2C code, with the aim of assessing the relative importance of heat source asymmetry and thermal hydraulic effects. The transient studied was based on the thermal conditions experienced in the NRU MT-3 ballooning

experiment, where extensive deformation occurred in the high α -phase region. (22 refs.)

112418 Use of base isolation and energy-absorbing restrainers for the seismic protection of a large power plant component. J.M.Kelly.
Report EPRI-NP-2918, Electr. Power Res. Inst., Palo Alto, CA, USA (March 1983), 94 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.

An assessment of the significance of the interaction between large power plant components and the plant structure of the seismic response of large components is reviewed. The feasibility of using rubber bearing isolation as a retrofit strategy to improve the structural integrity of the component and the use of various energy-absorbing restrainers for connecting the component to the primary structure are reported. Four test model configurations are described, and results of seismic shake table tests with a comparison of the results between the various configurations are presented.

112419 Technical basis of 'spectral source terms' for assessing uncertainties in fission product release during accidents in PWRs with special reference to Sizewell-B. M.R.Hayns, F.Abbey, P.N.Clough, I.H.Dunbar, D.H.Walker.
Report SRD R 256, UKAEA, Culcheth, Lancs., England (Nov. 1982), 105 pp.
A probabilistic approach is described by which the conservatism inherent in the traditional approach to determine PWR accident release source terms, exemplified by the Reactor Safety Study (WASH-1400), may be assessed, and spectral source terms generated. The method is developed by analysing the mechanisms of fission product retention in the reactor primary circuit and the conservatisms built into the conventional treatment of transport through the containment and leak path to the release point. Detailed probability distributions are derived for the reduction factors applicable to the point value source term at successive transport stages in a number of accident sequences, and the general value and validity of the approach is discussed. (18 refs.)

112420 Seismic response analysis with liquid-structure interaction. R.G.Thomas, L.P.Harrop.
Report SRD R 259, UKAEA, Culcheth, Lancs., England (June 1983), 98 pp.
A linear transient finite element stress analysis of a water filled tank has been carried out using the proprietary computer code ANSYS. The containment structure was represented as rigidly fixed to ground. The flexibility of the tank wall was modelled together with the hydrostatic and hydrodynamic effects of the water contents and attached concentrated masses. The foundations were considered to be laid in solid rock, and no soil-structure interaction effects were included. The seismic input was a ground response spectrum conservatively representing both the Temblor and Parkfield modified time history records. It was found that the response of the structure was greatest at the front end (furthest from the point at which the tank is connected to a rigid internal structure), and that this was dominated by the fundamental mode. Higher modes are important at the back end. Buckling at the front end of the tank has been identified as a potential failure mechanism, and attention has also been called to the tensile capacity of the wall to base junction in this region. The requirement for a proper criterion against which to assess the margin against plastic collapse in a safe shutdown analysis has been noted. In certain regions the structure does not shake-down under the repeated reversed cyclic loading, and the need for an assessment of the implications of this for fatigue resistance has been indicated. (44 refs.)

112421 Hydrogen phenomena in PWR degraded core accidents. S.F.Hall, J.MacKenzie.
Report SRD R 271, UKAEA, Culcheth, Lancs., England (May 1983), 56 pp.
Reviews and discusses recent data concerning hydrogen in PWR severe accidents. The mechanisms whereby hydrogen is distributed and mixed with the containment atmosphere are discussed in relation to experimental data. Experimental data on both hydrogen deflagration and detonation has significantly increased understanding of the physics of such phenomena, and given considerable predictive capability. A discussion of these is followed by its application to the analysis of likely plant damage, which includes recent data from entries into the damaged Three Mile Island Unit 2 containment building. (25 refs.)

112422 Theoretical analysis of hydrogen concentration distribution and acoustic field in Na-water steam generator in presence of micro-leak. R.Kozma, T.Katona.
Report KFKI-1983-60, Hungarian Acad. Sci., Budapest (1983), 25 pp.
The theoretical foundations of hydrogen concentration distribution and the acoustic field in a Na-water steam generator in the presence of a micro-leak are considered. It is shown that both problems lead to the solution of the same boundary value problem for the two-dimensional Helmholtz equation. For the solution of the Helmholtz equation the multiple scattering method is applied. The application of the presented theory in practice is discussed too. (6 refs.)

112423 Two-group criticality models for safety analysis considerations. O.Schaffer.
Report JUL-1856, Kernforschungsanlage, Jülich, Germany (June 1983), 60 pp.
Mathematical models based on the P_1 -approximation of the Boltzmann neutron transport equation (diffusion approximation) in two energy groups are presented in closed form in order to solve many criticality safety problems in handling fissionable material accurately. With regard to the complex subject of criticality a high degree of flexibility is emphasised in dealing with fuel moderator mixing ratios, reflector conditions, fuel interactions, geometry effects and component arrangements. Selected applications are directed in the investigation of the reflector effectiveness on critical and safe masses of highly enriched uranium mixed with graphite and hydrogenous moderators, considering different reflector materials, their positions and effects produced by material shifting and fuel condensation as well as the safe under-water storage of special MTR fuel elements and the safe storage of fuel-graphite specimens in a strongly concrete-shielded rectangular parallelepiped under water-flooding accident conditions. (15 refs.)

112424 Bubble growth in variable pressure fields. G.Egely.
Report KFKI-1983-72, Hungarian Acad. Sci., Budapest (1983), 24 pp.
Presents a study for the bubble behaviour in variable pressure fields. The presentation is started with the deduction of mass momentum and energy conservation equations in spherical form, and continued until the solution is presented in a closed integral form. The author outlines the numerical solution, too. The main object is to present a useful numerical tool for the study of growing or collapsing bubbles, in order to study the interface mass and energy transform terms, and the interface area. This is useful in reactor safety analyses.

112425 Evaluation of critical flow for supercritical steam-water. D.H.Lee, D.Swinnerton.

Report EPRI-NP-3086, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 172 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Subcooled water critical flow data from four simple geometries over the pressure range of 500 to 4500 psia, obtained on the UKAEA Winfrith high-pressure rig, are presented. A comparison of the results of these critical flow data to predictions of three critical flow models and the Bernoulli equation in order to demonstrate the degree of applicability of existing models to these data is reviewed. Comparison of high-pressure heat transfer data to previously reported work is also included.

112426 Testing and evaluation of on-line leak sealing methods. G.A.Smith.
Report EPRI-NP-3111, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 88 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

A test program, conducted to evaluate the effectiveness of commercial leak repair services (with respect to the requirements of nuclear power plants), is summarized. Sealants, fixtures, and techniques of three companies that are commercially engaged in on-line leak sealing are demonstrated. Test results and observations show that the effectiveness of an injected-sealant repair is determined by the quality of the initial repair and by its performance within the first 48 hours following repair.

112427 Transient cooldown in a model cold leg and downcomer. M.W.Fanning, P.H.Rothe.
Report EPRI-NP-3118, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 146 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Generation and evaluation of data obtained from an investigation of the cool-down transient of water in the cold leg and downcomer due to high-pressure injection in a stagnant loop are reviewed. Details are provided on fluid-mixing experiments, which were conducted in a 1/5-scale transparent PWR model, experimental results, which focus on the phenomena of buoyant-dominant fluid flow and mixing under stagnant loop flow; temperature data analysis; supportive flow visualization, and full data traces and tables.

112428 BWR spray nozzle performance in steam environment. H.J.Richter, G.G.C.Durkee.
Report EPRI-NP-3119, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 172 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Presents measurements of the water distribution below single full-scale BWR spray nozzles under different environmental conditions. Droplet velocities and size distribution were measured as well, and the findings are presented. The critical flow, bubbly flow, countercurrent flow, deentrainment, distribution, and condensation of droplet flow are discussed.

112429 Estimate of primary-system temperatures in severe reactor accidents. M.S.Hoseyni, A.T.Wassel, R.L.Ritzman.
Report EPRI-NP-3120, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 132 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Engineering calculations performed to provide estimates of primary coolant system conditions for several risk dominant LWR severe accident sequences are described. The specific time span and core locations under consideration are identified; predictions of the MARCH code for time-histories of temperature, flow rate, pressure, and composition of the gas stream exiting the core are provided; and results for the accident sequences of TMLB, S₂D, and AD for PWRs and TW and TC for BWRs are presented.

28.50 FISSION REACTOR TYPES AND APPLICATIONS

- 112430 Hitachi's large-scale FBR plant development programs. H.Yamaki (Hitachi Works, Hitachi Ltd., Tokyo, Japan), H.Yamamoto. *Hitachi Rev. (Japan)*, vol.32, no.2, p.100-4 (April 1983). [received: Aug. 1983]
- Hitachi is involved in the development of a large-scale fast breeder reactor (FBR) plant (1000 MWe) as part of its contribution to Japanese FBR development programs sponsored by various organizations. These programs follow the experimental reactor JOYO, now in stretched power level operation (MK-II), and the prototype reactor MONJU, which is in the final stage of the licensing process. In addition to these projects, Hitachi is proceeding with its own development programs. To meet large-scale FBR plant core design requirements, an axially heterogeneous core concept has been evaluated and applied to a 1000 MWe tank-type plant design study program. The plant design is supported by newly developed thermal-hydraulic or plant-dynamics evaluation codes. The paper summarizes recent progress made in Hitachi's large-scale FBR programs. (7 refs.)

28.52 FUSION REACTORS

(for confinement, see 52.55)

- 112431 Comments on 'Guidelines for the neutron scalar flux shaping of advanced nuclear energy device blankets' [and reply]. E.Greenspan (Dept. of Phys., Nuclear Res. Centre-Negev, Beer Sheva, Israel), S.Taczanowski. *Ann. Nucl. Energy (GB)*, vol.10, no.9, p.497, 499 (1983).
- Greenspan discusses the use of neutron scalar flux shaping for breeding in fusion reactor blankets. Taczanowski replies to his comments. (7 refs.)
- 112432 The basis mapping method for solving plasma equilibrium. Luo Zhengming (Southwestern Univ. of Phys., China). *Acta Mech. Sin. (China)*, no.3, p.233-40 (1983). In Chinese.
- By using the basis napping method, the solution of an improperly posed Cauchy problem of the magnetic flux equation is expressed by a series in which every term is a solution of a well-posed Dirichlet problem. Then this problem is further reduced to an overdetermined linear system. Using the Moore-Penrose theory of generalized inverses optimal least square solutions can be obtained. The numerical solutions of several plasma configurations and the corresponding current distribution of the maintaining coils have been obtained. Comparison with analytical solution shows that the precision of the method presented is good. (15 refs.)
- 112433 Various kinds of radiation implosion targets. F.Winterberg (Desert Res. Inst., Univ. of Nevada System, Reno, NV, USA). *Atomkernenergie. Kerntechnik. (Germany)*, vol.41, no.4, p.291-2 (1982). [received: Sept. 1983]
- In 'Hohlraum' or cavity targets for beam induced thermonuclear microexplosions, the beam energy is trapped and converted into black body radiation within a cavity. It is in turn the black body radiation which ablatively implodes the thermonuclear target placed inside the cavity. If one desires

smaller cavities one may implode the cavity by which one can amplify the black body radiation entrapped in it, provided the implosion velocity is sufficiently large. The author reports another possibility to reduce the overall target dimension drastically. In this concept the cavity is filled with, or rather replaced by, a dense plasma of a low atomic weight substance, for example beryllium. The density can be less than solid state density, in which case the plasma is produced from a dense vapor or gas, but it can even have solid state density, in which case the cavity is filled with a solid, for example beryllium. (5 refs.)

112434 Interpenetration burn for controlled inertial confinement fusion driven by nonlinear laser forces. H.Hora (Dept. of Theoretical Phys., Univ. of New South Wales, Kensington, Australia). *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.1, p.7-10 (1983). Contrary to the usual calculations of self-sustained fusion combustion fronts on the basis of shock waves, an interpenetration model is developed, where the α -reheat of a hot DT fusion layer compensates the heating up of a cold fuel layer into which the hot layer is penetrating. The basis of this process is that the propagation of the hot layer is not faster than its thermal expansion against vacuum what is justified due to recent results of space charge effects preventing very fast electron heat waves into the cold fuel. The needed energy densities of 2×10^{17} Joules/cm² are about 10 times less than in the shock wave model, but the penetration burn needs a very fast energy transfer for initiation (200 psec). For the powder densities of 10^{17} W/cm² and >300 kJ energy input, the CO₂ laser systems are preferable. The initiation heating is then possible by a radiation pressure transfer of the optical energy to 50 MeV, 10^{10} Amp/cm² space charge neutral 'ion beams'. (31 refs.)

112435 Net energy balance of Tokamak fusion power plants. R.Bunde (Max-Planck-Institut für Plasmaphysik, Garching, Germany). *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.2, p.73-9 (1983). The net energy balance for a Tokamak fusion power plant of present day design is determined by using a PWR power plant as reference system, replacing the fission-specific components by fusion-specific components and adjusting the non-reactor-specific components to altered conditions. For determining the energy input to the fusion plant a method was developed that combines the advantages of the energy input-output method with those of process chain analysis. A comparison with PWR, HTR, FBR, and coal-fired power plants is made. As a result the energy expenditures of the fusion power plant turn out to be lower than that of the LWR, HTR, or coal-fired power plant of equal net electric power output and nearly in the same range as FBR power plants. (28 refs.)

112436 Neutron multiplier thermal stresses in pure fusion and fusion-fission reactor blankets. R.N.Kostoff (Office of Energy Res., US Dept. of Energy, Washington, DC, USA). *Res. Mech. (GB)*, vol.9, no.1, p.1-34 (1983). An algorithm was derived for computing cyclic thermal stresses in the cladding of flat plate (slab) neutron multipliers heated by fusion-produced neutrons and located in the blanket of a fusion reactor whose core operates at an arbitrary pulsing frequency. When the thermal time constant of the slab is large relative to the cycle length, the cladding thermal stresses are approximately the same for all of the five fusion core concepts examined and equal to the steady state value. As the slab thermal time constant is decreased by decreasing the thickness of the slab, the absolute values of the cladding thermal stresses decrease, but at substantially different rates for long- and short-pulse concepts. For small slab thermal time constants, the cladding thermal stresses of the long-pulse concepts are substantially smaller than those of the short-pulse concepts. (23 refs.)

112437 Multijoint inspection robot. K.Asano, M.Obama, Y.Arimura, M.Kondo, Y.Hitomi (Energy Sci. & Technol. Lab., Toshiba Corp., Kanagawa, Japan). *IEEE Trans. Ind. Electron. (USA)*, vol.IE-30, no.3, p.277-81 (Aug. 1983). Describes a newly developed multijoint inspection robot for use in a fusion reactor. The design philosophy of the CCTV inspection robot and its control system are discussed. Then, details of the robot's hardware and control system are presented. Several experiments were made with an inspection facility model, and it was verified that this robot can easily get to an inspection target by weaving through obstacles. It is believed that this robot will be used as a key component in a remote inspection system in physically difficult to reach or dangerous environments. (4 refs.)

112438 A class of similarity solutions for the nonlinear thermal conduction problem. F.J.Mayer, J.F.McGrath, J.W.Steele (KMS Fusion Inc., Ann Arbor, MI, USA). *J. Phys. A (GB)*, vol.16, no.14, p.3393-400 (1 Oct. 1983). A class of self-similar solutions are rederived for the nonlinear thermal conduction problem. Variational methods applied to the heat flux provide an expression valid over a broad range of physical parameters. The results are particularly useful for the understanding of heat flux in the plasmas of internal confinement fusion. They describe both rapid laser and radiant heating of matter. The developments are shown to correspond well to several classical examples. (6 refs.)

112439 Effect of ³He on a permeation membrane. M.Nishikawa (Dept. of Nuclear Engng., Kyushu Univ., Fukuoka, Japan). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.343-4 (June 1983). Discusses the behaviour of ³He, the decay product of tritium, in permeation membranes for extracting and purifying tritium in the fuelling and blanket cycles of conceptual fusion reactors. (4 refs.)

112440 The role of the jet projection in global fusion research. V.O.Jensen (Riso Nat. Lab., Riso Nat. Lab., Roskilde, Denmark). *Phys. Scr. (Sweden)*, vol.T5, p.136-9 (1983). (Proceedings of the 4th Nordic Meeting on Nuclear Physics, Fuglso, Denmark, 16-20 Aug. 1982). JET (Joint European Torus) is a major fusion experiment now under construction near Abingdon in the UK. It is aimed at producing conditions approximating those necessary in a fusion reactor. The results expected from JET should permit a realistic evaluation on the prospects for fusion power and serve as a basis for the design of the next major fusion experiment. (no refs.)

112441 Predicted behaviour of the single-null divertor of INTOR. M.F.A.Harrison, E.S.Holston. *Report CLM-R 226*, UKAEA, Culham, Abingdon, Oxon., England (1982), 24 pp. Available from HMSO, London, England.

The performance of the single-null divertor is modelled over a range of scrape-off plasma parameters appropriate to the concepts envisaged in the INTOR Phase I and Phase IIA and particular attention is given to a comparison of the behaviour of beryllium and tungsten targets. The models predict for INTOR conditions that the DT plasma within the divertor chamber is cooled by localised recycling and that most of the energy which flows into the chamber is eventually deposited upon the target by convective transport through the sheath. Catastrophic sputtering of a tungsten target is in principle

possible because the self-sputter yield of tungsten can exceed unity. However, the present analyses show that such conditions are unlikely when there is substantial recycling of DT within the divertor chamber; indeed the self-sputter rates predicted here for tungsten are less than those for beryllium. Moreover, the temperature of the plasma at the sheath edge and also the effective sputtering of impurity atoms are sensitive to the plasma density in the scrape-off region. Increasing the scrape-off density to about 8×10^{19} m⁻³ ensures that the effective sputter yield of tungsten does not exceed $\sim 10^{-4}$. (4 refs.)

112442 CVD coatings in fusion reactor technology. F.Brossa (Materials Sci. Div., Joint Res. Centre, Comm. of the European Communities, Ispra, Italy). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.340-9. A large number of coatings have been evaluated as a protective low Z layer for the first wall of a magnetically confined fusion reactor: B, Si, Al₂O₃, TiC, TiN, SiC and B₄C. High Z coatings Mo, Ta and W, have also been proposed for in-vessel component protection against heavy heat loads. CVD is the technique most commonly employed for coating first wall candidate materials (AISI 316, 310, 304, Inconel 600, Mo, Al and Cu). The coatings produced by this technique have a high adherence, are homogeneous and pore-free. The sputtering behaviour of these coatings has been tested under H⁺, D⁺ and He⁺ irradiation in the 100 eV-8 KeV energy regime. Other properties, such as arc erosion, evaporation rate, thermal fatigue resistance, compatibility and adherence to base material, have also been tested in laboratory scale equipment. (21 refs.)

28.58 INTEGRATED REACTOR SYSTEMS

112443 A fusion-fusion reactor driven by plasma-liner impact. J.G.Linhart. *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.1, p.1-6 (1983). It is shown that the impact of a quasi-spherical plasma liner on a spherical solid liner can produce a highly luminous source of soft X-rays. This radiation can be used for the ablation of an inner spherical liner, which can be thus accelerated to speeds above 10^7 cm/sec. Such a liner should be able to compress a core of fissionable material, surrounded by a D-T mantle to fission-criticality. The burst of the fission energy then ignites the D-T mantle which produces a larger burst of fusion energy. The energy liberated in such a microexplosion is estimated to be of the order of 1 GJ. An apparatus based on a symmetrical plasma-focus geometry should be able to produce the plasma liner. A reactor combining these concepts is described. (12 refs.)

112444 Möglichkeiten der Spaltstoffherzeugung für Hochtemperatur-Reaktoren im Verbundsystem von Hochtemperatur-Reaktor und Fusionsreaktor (Facilities for producing fissile fuel for high temperature gas-cooled reactors in a symbiotic fission-fusion system). S.Meuresch. *Report JUL-1827*, Kernforschungsanlage, Jülich, Germany (Jan. 1983), 75 pp. In German. In the blanket of a hybrid reactor the 14.1-MeV neutrons of the DT-fusion are used for breeding tritium and the fissile fuel U-233. Some different fertile materials are investigated. Best breeding results are achieved by using a Li-Pb-eutectic in conjunction with ThO₂ containing coated particles. The blanket region is subdivided in a 40-cm-thick breeding zone and a 59.2-cm-thick zone for fissile fuel production. A 60-cm-thick stainless-steel-boron carbide shield prevents radiation damage to the components of the superconducting magnet. The neutron and gamma-ray fluxes were calculated by solving the discrete ordinates form of the transport equation using the ANISN program in the P₃S₈ approximation in one-dimensional cylindrical geometry. The calculations for the isotope generation and depletion were performed using the ORIGEN code. Resonance calculations for Th-232 were done with the modul NITAWL of the AMPX code system. The nuclear cross sections were mainly taken from the ENDF/B-IV-Library. (28 refs.)

28.70 NUCLEAR EXPLOSIONS

(see also 47.40 Shock and detonation phenomena)

112445 Hot particles from nuclear atmospheric test of October 1980. S.Sonoc, C.Dovlete (Inst. de Meteorologie si Hidrologie, Bucuresti, Rumania). *Stud. & Cercet. Fiz. (Rumania)*, vol.35, no.8, p.744-7 (1983). In Rumanian. The first identification in Rumania of a hot particle from an atmospheric thermonuclear explosion is reported. The sample was collected by air filtration using a cellulose filter. Gamma spectroscopy with Ge(Li) detector measurement of the sample enabled one to identify Zr-95 and Nb-95. The presence of these radionuclides in quantities comparable to those reported by other authors in hot particles, as well as the absence of other radionuclides, agrees well with the models of hot particles generation and atmospheric transport. (7 refs.)

28.80 RADIATION TECHNOLOGY, INCLUDING SHIELDING

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

112446 Gamma dosimetry using lyoluminescence of tris (hydroxymethyl) aminomethane. S.K.Mehta, I.K.Oommen, S.Sengupta, S.D.Soman (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.393-6 (1 Aug. 1983).

Lyoluminescence (LL) of tris (hydroxymethyl) aminomethane has been studied and compared with the LL of glucose, mannose, valine and glutamine. Among these materials, tris (hydroxymethyl) aminomethane on dissolution in luminol shows the highest LL sensitivity and stability. The linear dosimetric range of this system is $0.1-2 \times 10^2$ Gy which makes it useful in the fields of radiotherapy and radiation processing of food. (8 refs.)

112447 Experience in the use of lapel air samplers at AWRE. E.W.Jones, R.G.Hopkins, D.L.E.Smith, D.M.Wallace (Atomic Weapons Res. Estab., Min. of Defence Procurement Executive, Aldermaston, England). *J. Soc. Radiol. Prot. (GB)*, vol.3, no.3, p.11-17 (Autumn 1983).

The authors outline the experience at AWRE in making intensive use of small air samplers, commonly described as personal air samplers or lapel air samplers and for convenience referred to hereafter as 'PAS'. It indicates the general pattern of results obtained, the interpretation which has been placed upon them, the difficulties which have been encountered in conducting a routine sampling programme and in maintaining the instruments and summarises the expenditure of resources which has been required. It is hoped that the information may be of value to others who are contemplating large scale use of PAS or endeavouring to assess the value of this technique for operational control or dosimetry purposes. (1 ref.)

112448 Summary report on development of an integral model of a radioactive jet (from a reactor accident). A.Badre, D.Grand. *Eur. Appl. Res. Rep. Nucl. Sci. Technol. Sect. (USA)*, vol.5, no.1, p.1-119 (1983).

In the present survey of studies on radioactive jets, the main point of view considered has been the prediction of concentration and trajectory. Although it may be more important for practical purposes to determine the direct risks to the environment viewed as a whole (human, agricultural, economic, etc.), this aspect of the problem remains underlying since its determination depends mainly on the results of the calculations of trajectory and concentration. The present study is concerned with the near-field of jets (the near-field being the relation of the jet close to its source where the dynamic of the jet is still relevant compared to that of the ambient atmosphere). The authors consider the rise of a moist plume that contains radioactive products, by means of an integral method. (61 refs.)

112449 Study of shielding characteristics of certain materials. II. Change of dosimetric characteristics during irradiation on a ^{252}Cf -source depending on the type of shielding and geometric arrangement. Z.Prouza, J.Hermanska (Inst. of Biophysics & Nuclear Medicine, Charles Univ., Prague, Czechoslovakia), O.Neruda, J.Cerny, F.Spurney. *Jad. Energ. (Czechoslovakia)*, vol.29, no.8-9, p.319-23 (Aug.-Sept. 1983). For pt.1 see *ibid.*, vol.29, p.267, (1983). For a set of 18 spectra measured on a ^{252}Cf -source after the passage of radiation through different types of shielding dosimetric quantities are presented. Relations between these quantities are studied. (12 refs.)

112450 Electret dosimeter. M.Ikeya (Tech. Coll., Yamaguchi Univ., Ube, Japan).

Oyo Buturi (Japan), vol.52, no.4, p.305-9 (April 1983). In Japanese. Describes the principles and development history of dosimeters using electrets, whose surface charge quantity is lost by radiant-ray irradiation. The materials applicable to this service include fluorine polymers such as PVDF. These materials are characterized by their high stopping power compared to glasses, which permits a small-volume detector for high-energy particles. The author's developed neutron dosimeter using a fluorine polymer electret is measurable up to 10^{-2} mGy. (24 refs.) K.B.

112451 Computer-based system enhances radiation data management. J.H.G.Zdzieborski, D.Kahn (United Engrs. & Constructors Inc., Philadelphia, PA, USA), G.L.Waldkoetter.

Power (USA), vol.127, no.8, p.81-5 (Aug. 1983). Safety of plant personnel and the public dictates effective radiation control at nuclear powerplants. A state-of-the-art digital system will simplify this demanding task at a plant nearing completion. (no refs.)

112452 Plans for safeguarding the population with respect to nuclear power stations. H.Rouanet (Min. de l'Interieur et de la Decentralisation, Paris, France).

Rev. Gen. Nucl. (France), no.3, p.206-8 (May-June 1983). In French.

The Directorate of Civil Safety has drawn up its measures for safeguarding the population in the event of accidents in nuclear plans as part of the 'ORSEC' plans. These general safety measures, which are completed by the specialised, so-called 'ORSEC-RAD' appendices, are being put into effect at the individual nuclear power plant level by the creation of Special Safety Measures (PPI) which form an integral part of the ORSECRAD plans. The author describes the organisation of these ORSECRAD-PPI plans and the allocation of the responsibilities involved. The author then sets out their contents together with the specialised methods which exist for the different types of safety measures to be implemented. (no refs.)

112453 Inter-ministerial nuclear security exercises. P.O.Halpern (Comite Interministeriel de la Securite Nucleaire, Paris, France).

Rev. Gen. Nucl. (France), no.3, p.209-14 (May-June 1983). In French.

If a nuclear incident or accident occurs, a series of measures are planned which are aimed at protecting both workers at the plant and the general

public. This 'emergency programme', the arrangements of which are described by the author, involves coordinated action on the part of the plant operators, the safety authorities and, in a more general way, the public authorities. The efficiency of this emergency system has been tested several times up to now when inter-ministerial exercises based on simulated accidents affecting various nuclear power stations have been carried out. The author describes the objectives sought, the practical details of these exercises and the lessons which have been learnt from them. (no refs.)

112454 Quantifizierende Bemerkungen zur Frage der Konservativitat der 'Allgemeinen Berechnungsgrundlagen' (Quantified remarks on the question of the conservation of general calculation inputs). H.D.Brenk, K.J.Vogt.

Report JUL-1821, Kernforschungsanlage, Julich, Germany (Dec. 1982), 147 pp. In German.

Dose prediction models are always subject to uncertainties due to a number of factors including deficiencies in the model structure and uncertainties of the model input parameter values. In lieu of validation experiments the evaluation of these uncertainties is restricted to scientific judgement. Several attempts have been made in the literature to evaluate the uncertainties of the current dose assessment models resulting from uncertainties of the model input parameter values using stochastic approaches. Less attention, however, has been paid to potential sources of systematic over- and underestimations of the predicted doses due to deficiencies in the model structure. The present study addresses this aspect with regard to dose assessment models currently used for regulatory purposes. The influence of a number of basic simplifications and conservative assumptions has been investigated. (82 refs.)

112455 Release of gaseous tritium during reprocessing. H.Brucher, K.Hartmann.

Report JUL-1838, Kernforschungsanlage, Julich, Germany (Jan. 1983), 132 pp.

About 50% of the tritium put through an LWR reprocessing plant is obtained as tritium-bearing water, HTO. Gaseous tritium, HT, has a radiotoxicity which is by 4 orders of magnitude lower than that of HTO. A possibility for the removal of HTO could therefore be its conversion into the gas phase with subsequent emission of the HT into the atmosphere. However, model computations which are, in part, supported by experimental data reveal that the radiation exposure caused by HT release is only by about one order of magnitude below that caused by HTO. This is being attributed to the relatively quick reoxidation of HT by soil bacteria. Two alternatives for producing HT from HTO (electrolysis; voloxidation with subsequent electrolysis) are presented and compared with the reference process of deep-well injection of HTO. The authors come to the conclusion that tritium removal by HT release into the atmosphere cannot be recommended at present under either radiological or economic aspects. (30 refs.)

112456 SARTEMP2 - A computer program to calculate power and temperatures in a transport flask during a criticality accident. P.M.Shaw.

Report SRD R 266, UKAEA, Culcheth, Lancs., England (April 1983), 31 pp.

The program SARTEMP calculates the fission release and temperatures obtained in a transport flask following a hypothetical criticality incident. This extended version of the program has been developed, in association with a collaborative study between staff of the Commissariat a l'Energie Atomique (CEA) and UKAEA, to study the effects of an accident during water filling of a particular design of transport flask carrying a particular arrangement of fuel pins. Two cases are considered. The first case assumes a slow rate of filling corresponding to the flask being lowered into a pond. It has been determined that the flask will reach delayed critical when the water height is 1 m. For the second case, a faster rate of filling is assumed and delayed critical occurs at a water height of 3.5 m. These values are specific to this particular design. The program can, however, be used to analyse more general designs of flask.

112457 Neutron response of several fission track detectors worn on the body. J.Palfalvi.

Report KFKI-65, Hungarian Acad. Sci., Budapest (1983), 11 pp.

The combined effect of incident and albedo neutrons on the response of several fission track detectors was investigated by calculations for monoenergetic neutrons and for neutrons from different energetic sources. The response functions are presented in tables and plots. (9 refs.)

112458 Results of environmental radioactivity measurements in the Member States of the European Community for air - deposition - water - milk 1981.

Report EUR 8308 DA/DE/EN/FR/IT/NL, Comm. European Communities, Luxembourg (1983), 287 pp.

This is the 21st report on environmental radioactivity published by the Health and Safety Directorate of the Commission of the European Communities. It has been prepared from data gathered at the stations which monitor environmental radioactivity in the Member States. The results are taken from the data communicated to the Commission of the European Communities in accordance with Article 36 of the Treaty of Rome establishing the European Atomic Energy Community. The results contained in the report refer to radioactivity measurements for air, deposition, surface water and milk during 1981 in the ten Member States of the European Community (Belgium, Denmark, Federal Republic of Germany, Greece, France, Ireland, Italy, Luxembourg, The Netherlands and United Kingdom).

112459 Progress report programme. Radiation protection 1982.

Report EUR 8486 DE/EN/FR, Comm. European Communities, Luxembourg (1983), viii + 1225 pp.

The progress report of the radiation protection programme outlines the research work carried out in 1982 under contracts between the Commission of the European Communities and research groups in the Member States. Results of about 320 individual projects are reported. They are grouped into 6 sectors: radiation dosimetry and its interpretation, behaviour and control of radionuclides in the environment, short-term somatic effects, late somatic effects as well as genetic effects of ionizing radiation and evaluation of radiation risks. More than 900 scientific publications are referred to in this report. The role of this scientific programme is: (i) to study methods of reducing radiation exposure and minimizing the radiation hazards in all circumstances, (ii) to study ways and means of acting rapidly and effectively in the event of an accident, (iii) to acquire the research results necessary to update the basic principles of radiation protection, and (iv) to supply sufficient information to contribute to a framework for making informed decisions on issues on which public opinion has become very sensitive.

112460 Instrumentation developed by the Bureau of Mines for continuously monitoring radon and radon daughters. J.C.Franklin (Bur. of Mines, US Dept. of Interior, Spokane Res. Center, Spokane, WA, USA), R.F.Drouillard. Instrumentation in the Mining and Metallurgy Industries. Vol.9. Proceedings of the 10th Annual Mining and Metallurgy Industries Symposium and Exhibit, Denver, CO, USA, 5-7 May 1982 (Research Triangle Park, NC, USA: ISA 1982), p.103-15.

The US Bureau of Mines has developed instrumentation to continuously monitor radon and radon daughters in underground uranium mines. These

monitors have been used for several years by the Bureau and Bureau contractors to collect data in both active and experimental mines. The working level monitors are used with an alarm system to alert surface personnel when the underground working level is excessive. Other sensors have been developed for the alarm system that will notify surface personnel on loss of power to fans or air doors left open. Also developed was a personal radon daughter dosimeter using a thermoluminescent detector. The dosimeters can be worn on the miners' belts to measure their actual exposures. Both laboratory and field testing of these dosimeters were satisfactory. (13 refs.)

28.90 OTHER TOPICS IN NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

112461 The significance of inertial confinement fusion for fundamental research. F.Winterberg (Desert Res. Inst., Univ. of Nevada System, Reno, NV, USA). *Atomkernenerg. Kerntech. (Germany)*, vol.41, no.4, p.267-72 (1982). [received: Sept. 1983]

Thermonuclear microexplosions have besides commercial energy production other very exciting applications. Rockets driven by thermonuclear microexplosions can lead to interstellar missions to neighboring solar systems. Particle accelerators capable of reaching ultrahigh energies, approaching the grand unification energy scale, are another exciting possibility. (no refs.)

112462 Proposal for decommissioning of contaminated steel parts from shut down nuclear power plants. W.M.Francioli (Eidgenössisches Inst. für Reaktorforschung, Würenlingen, Switzerland). *Atomkernenerg. Kerntech. (Germany)*, vol.41, no.4, p.279-80 (1982). In German. [received: Sept. 1983]

During the dismantling of a shut-down nuclear power plant a number of relatively strongly radioactive components (reactor internals, part of the pressure vessel) have to be removed from the reactor core region. These components need heavy shielding for the transport to their final disposal. Further, large amounts of contaminated steel parts have to be disposed of. It is suggested to melt down the contaminated steel and to use it as shielding material in the disposal of the highly radioactive components. On the basis of assumed contamination the dose rates for melt-down material are estimated. In addition, problems of melting are presented. (1 ref.)

Protection and control of nuclear materials: a pressing obligation See Entry 112338

29.00 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS

29.10 PREACCELERATION (INJECTION)

112463 An injector for RFQ1. M.R.Shubaly, M.S.de Jong (AECL, Res. Co., Chalk River Nuclear Labs., Chalk River, Ontario, Canada). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.3001-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

RFQ1 has been designed as a 600 keV, 75 mA CW radiofrequency quadrupole (RFQ) accelerator with a 50 kV injector that will be used to study the operation and current limits of an RFQ structure. Its injector must operate over a wide current range at a fixed energy and must match the acceptance of the RFQ structure over the entire range. This paper discusses the requirements and the final design of the injector. Experiments performed on existing test facilities to study some aspects of the design are also presented. (7 refs.)

29.15 ELECTROSTATIC AND LINEAR PARTICLE ACCELERATORS

112464 The FMIT accelerator. D.D.Armstrong (Los Alamos Nat. Lab., Los Alamos, NM, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2965-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A 35-MeV 100-mA CW linear accelerator is being designed by Los Alamos for use in the Fusion Materials Irradiation Test Facility. Essential to this

program is the design, construction, and evaluation of performance of the accelerator's injector, low-energy beam transport, and radio-frequency quadrupole sections before they are shipped to the facility site. The installation and testing of some of these sections have begun as well as the testing of the RF, noninterceptive beam diagnostics, computer control, DC power, and vacuum systems. An overview of the accelerator systems and the performance to date is given. (30 refs.)

112465 The advanced test accelerator (ATA), a 50-MeV, 10-kA induction linac. L.Reginato (Lawrence Livermore Nat. Lab., Livermore, CA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2970-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The ATA is an induction accelerator designed to produce 70 ns pulses of electrons at currents of 10 kA and energies in excess of 50 MeV. The accelerator is capable of operating at an average rate of 5 Hz or at 1 kHz for ten pulses. The parameters were chosen primarily to provide the experimental basis for advancing the understanding of electron beam propagation physics. The 85 m accelerator has been under construction for the past four years and has adopted mainly an improved version of the ETA technology to satisfy the required parameters. Initial operation of the facility and the energy conversion system from primary power to axial electric field is described; recent advances in magnetic switching which have been incorporated in the injector are also discussed.

112466 Design, construction and performance of the INS RFQ linac 'LITL'. N.Ueda, T.Nakanishi, S.Arai, T.Hattori, T.Fukushima, Y.Sakurada, T.Honma, N.Tokuda, S.Yamada, M.Takanaka (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), A.Itano, A.Mizobuchi, Y.Hirao. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2975-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

An RFQ linac 'LITL' (Lithium Ion Test Linac) was constructed and accelerated ion beams of H⁺, H₂⁺, H₃⁺, He⁺, Li⁺ and ⁷Li⁺. The machine was designed to accelerate particles with charge to mass ratio (q/A) of 1-1/7 injected at 5 keV/u up to 138 keV/u. The acceleration cavity of four vane structure is 56 cm in diameter and 138 cm in length. Transmission exceeding 90% has been obtained for proton beam of 80 μA. The acceleration characteristics agree well with the computer simulation with PARMTEQ. For the acceleration of ⁷Li⁺, an RF power of 22 kW is fed with a loop coupler. In CW operation, an electric field of 205 kV/cm has been applied, which is required for ⁷Li⁺ acceleration and corresponds to 1.8 times the Kilpatrick's criterion. A maximum field of 2.0 times the criterion has been achieved, in pulse operation, with a duration width of 5 ms and repetition period of 25 ms. Operation of the machine is easy and stable. (8 refs.)

112467 Status report on the upgraded Unilac. N.Angert (Gesellschaft für Schwerionenforschung mbH, Darmstadt, Germany).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2980-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

By adding two Alvarez tanks to the Unilac post-stripper maximum energies can be achieved of 19 MeV/u for uranium, and more than 20 MeV/u for ions of medium mass (A<150) using a second stripper in front of the single-gap cavity resonators. The injector beam transport system was modified, too, resulting, together with ion source developments, in an increase of beam intensities of about one order of magnitude. Operating experience of the first year after the upgrading is reported. (9 refs.)

112468 Improved performance of the Munich heavy ion postaccelerator. E.Nolte, R.Geier, U.Ratzinger, W.Schollmeier, S.Gustavsson, N.Gartner, H.Moringa (Fachbereich Phys., Tech. Univ. München, München, Germany). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2983-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Improvement of the shunt impedance and of the phase acceptance of the Munich heavy ion postaccelerator is described. The shunt impedance has been increased by using slimmer drift tubes, by mounting more drift tubes and by installing a drift tube configuration with flat gap voltage distribution along the resonator axis. The phase acceptance has been increased by means of a three-harmonics double-drift buncher on the high-energy side of the tandem. The phase acceptance of the system buncher-booster is about 70%. (4 refs.)

112469 Radio-frequency accelerators for multi-kiloampere electron beams. S.Humphries, Jr., Chang-Sing Hwang. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2986-8 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Most present work on intense pulsed electron beam accelerators is directed toward linear induction accelerators. The authors consider the application of resonant accelerators to the generation of pulsed, multi-kiloampere electron beams. The main relative advantages are: (1) low cost and high voltage gradient can be achieved by eliminating ferromagnetic isolation cores; (2) cavity designs are simpler (with optimum utilization of vacuum insulators); and (3) there are no high voltage shorting switches. The latter feature implies that RF (radio-frequency) accelerators may operate at higher repetition rate and duty cycle. (6 refs.)

112470 High charge picosecond pulses with a double gap subharmonic buncher. G.Mavrogenes (Argonne Nat. Lab., Argonne, IL, USA), W.Gallagher, T.Kohe, D.Ficht. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.4, pt.2, p.2989-91 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A new improved bunching system was designed in 1976 and installed in 1981 in the Argonne Electron Linac to replace the one installed in 1972. In the new bunching system a spiral loaded double gap 12th subharmonic buncher is replacing the previous single gap 6th subharmonic buncher and a one wavelength fundamental frequency traveling wave prebuncher has replaced the previous two wavelength prebuncher. Individual pulses of picosecond (25 to 36) duration and up to 40 nC Coulomb in charge, with ΔE/E<±0.5% at FWHM over the energy range of 4 to 22 MeV, and a repetition rate from one to 1000 psec are available to the experimenter on a routine basis. The design and the microwave properties of the cavity are discussed along with the general design of the injector and the results achieved. (5 refs.)

112471 Update on the high-current injector for the Stanford linear collider. M.B.James, J.E.Cledenin, S.D.Ecklund, R.H.Miller, J.C.Sheppard, C.K.Sinclair, J.Sodja (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2992-4 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The high current injector has become operational. There are two crucial areas where improvements must be made to meet collider specifications. While the injector can produce up to 10¹¹ e⁻ in a single S-band bucket, initially much

of this charge was captured in a low energy tail and was thus not suitable for transport through the accelerator and injection into the damping ring. Pulse to pulse position jitter has been observed, resulting in transverse wake fields which increase beam emittance. The problems described above contribute to substantial current loss during transport from the injector (40 MeV) to the SLC damping ring (1.2 GeV). Experimental studies are continuing with the aim of understanding and improving beam characteristics including bunch length, pulse to pulse stability and emittance. The present status of these studies is reported. (5 refs.)

112472 Transient beam loading calculations and experiment at the Saclay electron linac. B.Aune, J.Leroy, A.Mosnier (DPH-N/AL, CENS, Gif-sur-Yvette, France).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2995-7 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The transformation of the Saclay electron linac (ALS) into an injector for a 2 GeV stretcher ring is under study. One of the problems associated with this transformation is the use of the existing sections in a new mode of operation. The sections were optimized for low current operation (high attenuation, high internal resistance), they will be used in a high current, short pulse (1 μ s) mode resulting in a prohibitive transient beam loading energy spectrum broadening. The compensation method used at SLAC, which consists in delaying the turn-on of some klystrons, has been studied theoretically and an experiment has been performed with a 1 μ s pulse, at the same beam loading level as for the future plans. (5 refs.)

112473 Design and fabrication of the BNL radio frequency quadrupole. R.B.McKenzie-Wilson (Brookhaven Nat. Lab., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2998-3000 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The Brookhaven National Laboratory polarized H^- injection program for the AGS will utilize a Radio Frequency Quadrupole for acceleration between the polarized source and the Alvarez Linac. Although operation will commence with a few μ amperes of H^- current, it is anticipated that future polarized H^- sources will have a considerably improved output. The RFQ will operate at 201.25 MHz and will be capable of handling a beam current of 0.02 amperes with a duty cycle of 0.25%. The resulting low average power has allowed novel solutions to the problems of vane alignment, RF current contacts, and removal of heat from the vanes. The cavity design philosophy is discussed together with the thermodynamics of heat removal from the vane. Details of the fabrication are presented with a status report. (no refs.)

112474 Mechanical design of a heavy ion RFQ. S.Abbott, R.MacGill, R.Yourd (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3004-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The mechanical design and construction of a 199.3 MHz heavy ion RFQ for charge states q/A as low as 0.14 is described. The vane supports and positioning adjustments are significant features of this design. They provide the capability of achieving the precision vane alignment required. The maximum difference between calculated and measured apertures between the vanes is 0.0035 inches, and the average difference is 0.0010 inches. Various important aspects of the design and construction including material selection and plating, RF joints, thermal loading and vacuum system are described. Assembly techniques, methods of mechanical measurement, alignment and structure stability are discussed in detail. (6 refs.)

112475 Improved field stability in RFQ structures with vane coupling rings. H.R.Schneider, H.Lancaster (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3007-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The small aperture common in many RFQ linac designs lead to tuning difficulties, primarily because asymmetries in the quadrant fields can arise as a result of small non-uniformities in the vane to vane capacitances. Sensitivity to such capacitance or other tuning variation in the quadrants is greatly reduced by the introduction of pairs of vane coupling rings that provide periodic electrical connections between diametrically opposite vanes. Results of measurements on a cold model RFQ structure with and without vane coupling rings are presented. The number of rings required for field stabilization and the effect of rings on mode frequencies are discussed. (4 refs.)

112476 Conversion of the AGS linac to H^- acceleration. R.L.Witkov, D.S.Barton, R.K.Reece (Brookhaven Nat. Lab., Upton, NY, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3010-12 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The AGS 200 MeV linac was converted to an H^- accelerator during the summer of 1982 using a magnetron-type source in the column of the second pre-injector pit. Because of the re-entrant electrode design, a 20 keV transport line was required to carry the beam to the first electrode. Several changes were made to the source which enhanced its performance over previous designs. The same H^- beam current is available at 2.75 times the duty factor with reduced deterioration of its output over several months of operation. The source, 750 keV transport, and linac modifications and performance will be presented. (8 refs.)

112477 Post-coupler and stem current measurements for high current CW drift-tube linacs. J.Unguin, S.O.Schriber, R.A.Vokes (AECL, Res. Co., Chalk River Nuclear Labs., Chalk River, Ontario, Canada).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3013-15 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Post-coupler characteristics have been measured on a model Alvarez tank for drift-tube-to-outer tank diameter ratios from 0.10 to 0.25. A maximum ratio beyond which field stabilization is not possible and a minimum ratio where stabilization is difficult have been determined. Field stabilization has been studied using two to twenty-one post couplers in a 22 cell tank. A sensitive dependence of the drift-tube stem currents near the tank end walls on the end cell geometry has been found. (6 refs.)

112478 First operation of proton induction linac. S.Kawasaki (Faculty of Sci., Kanazawa Univ., Kanazawa, Japan), Y.Kubota, A.Miyahara, K.Yamamoto.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3016-18 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A prototype of proton induction linac was developed to study the beam dynamics and the operational characteristics in this type of the accelerator specifically in the case of the intense ion beam acceleration. The driver system is composed of three identical unit modules, each of which consists of three toroidal cores made of laminated silicon-iron foil of 0.1 mm thickness

and the driving circuit linked with the cores. The accelerating field of 28 kV/module is obtained typically during a period of 2-3 μ sec. A proton beam of about 200 mA is extracted directly with the field driven inductively by the first module and then accelerated with succeeding two units to give the particles of about 60 keV at the output of the modules. Preliminary results of the measurements of the beam characters are given with the design of the device. (3 refs.)

112479 Subharmonic beam-loading in electron linear accelerators. W.J.Gallagher (Boeing Aerospace Co., Seattle, WA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3019-20 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The intention of operating an electron linear accelerator subharmonically beam loaded for free electron laser (FEL) application requires justification of the beam-loaded energy gain equation. The mode of operation typically planned is 5-10 nanoCoulombs single RF cycle pulses at 25-50 nanosecond intervals. This inquiry investigates details of that sort of beam loading and the performance achievable. (6 refs.)

112480 NBS-LANL RTM injector installation. M.A.Wilson, R.I.Cutler, E.R.Lindstrom, S.Penner, N.R.Yoder, R.L.Ayres, D.L.Mohr (NBS, Washington, DC, USA), L.M.Young, E.R.Martin.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3021-3 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The injector for the NBS-LANL CW racetrack microtron (RTM) consists of a 100 keV electron gun and beam transport line followed by a 5 MeV linac. The function of the gun and transport line, which have been installed at NBS, is to provide a chopped and bunched, 100 keV, and up to 0.67 mA DC or pulsed beam of very low transverse emittance ($<5\pi$ mm-mrad) for matched insertion into the linac. The authors present both design and construction details of the 100 keV system and the results of preliminary beam tests. The tests conducted thus far show the gun and transport system to be performing well within design specifications. (3 refs.)

112481 Research on electron linear accelerators with traveling wave resonators. II. Wang Yuan-ling (Dept. of Phys., Univ. of Nanjing, Nanjing, China).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3024-6 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

For pt.1 see *ibid.*, vol.NS28, p.3526 (1981). In the first part, under beam loading conditions, the formula of the energy gain of the electron linac with the traveling wave resonator was given by: $V_0 = M_0 E_0 L (1 - e^{-\tau}) / \tau - i r L (1 - (1 - e^{-\tau}) / \tau)$. In this paper, under beam loading conditions the field multiplication factor M_0 is derived. It makes this type of accelerator (including accelerators with feedback) design according to the same way as general electron traveling wave linacs. Under test of the electron linac with the traveling wave resonator, unstable phenomena are described. Their causes are discussed. They have been overcome. (3 refs.)

112482 A multidimensional study of a 50-MeV, 1500-rad/pulse radiographic linac, using the stagger-tuning concept. R.K.Owen, M.V.Fazio, T.J.Boyd (Los Alamos Nat. Lab., Los Alamos, NM, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3027-9 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Stagger tuning of accelerator cavities, or blocks of cavities, can significantly enhance the achievable charge transfer through an electron linac operating in the stored-energy mode. The output bremsstrahlung flux can be increased over a conventional approach by an order of magnitude without any significant degradation in emittance growth or energy spread. Given a suitable injector, a 1500-rad/pulse, 50-MeV radiographic linac appears to be practical at a 400-MHz operating frequency; a 150-rad/pulse, 50-MeV radiographic linac will operate at 1300 MHz. A multidimensional study was made using the PARMELA code where several parameters, including beam current, synchronous phase angle, and beam radius were varied while observing the effects on emittance and transmission efficiency. (no refs.)

112483 Recent performance improvements on FXR. B.Kulke, R.Kihara (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3030-2 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The FXR machine is a nominal 4 kA, 20 MeV, linear induction, electron accelerator for flash radiography at LLNL. The machine met its baseline requirements in March 1982. Since then, the performance has been greatly improved. Stable and repeatable beam acceleration and transport have been achieved, with over 80% transmission to the tungsten bremsstrahlung target located some 35 m downstream. For best stability, external beam steering has been eliminated almost entirely. Over 500 Roentgen at 1 m from the target (TLD measurement) are regularly produced, with a radiographic spot size of 3-5 mm. Present efforts are directed towards the development of a 4 kA tune, working interactively with particle-field and beam transport code models. A remaining uncertainty is the possible onset of RF instabilities at the higher current levels. (3 refs.)

112484 Operation experience of the Riken variable-frequency heavy-ion linac, RILAC. M.Kase, M.Odera (Linac Lab., Inst. Phys. & Chem. Res., Saitama, Japan), Y.Chiba, Y.Miyazawa, M.Hemmi, T.Tonuma, T.Inoue, T.Kambara, M.Yanokura, T.Kubo, E.Ikezawa.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3033-5 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

The RILAC, the variable-frequency heavy-ion linac, which will be used as an injector to the separated sector cyclotron, has provided useful beams to experimental groups. The frequency range available now is 18-30 MHz. The upper limit is determined by the parasitics mode at 35 MHz in the RF system. The beam energy can be varied in a wide range by changing the beam phase without degrading the beam quality so much. (5 refs.)

112485 4 π -mode acceleration in KEK 20-MeV proton linac. E.Takasaki, T.Kato, Z.Igarashi, K.Ikegami, C.Kubota, Y.Mori, A.Takagi, T.Takenaka, S.Fukumoto (Nat. Lab. for High Energy Phys., Ibaraki, Japan).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.3036-8 (Aug. 1983). (1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

Ions of H_2^+ and He^{2+} were accelerated by 4 π -mode operation in the KEK 20 MeV proton linear accelerator. In this mode the same accelerating field distribution and the same focusing magnetic field strength as those for protons were used. This paper gives the experimental results of the relation between the injection energy and the accelerating field strength and of the beam intensity as a function of the field strength. (6 refs.)

112486 Collective acceleration of ions in straight relativistic electron beams. V.M.Bystritskii, A.N.Didenko (Inst. of Nuclear Phys., Tomsk, USSR).

Sov. J. Part. & Nucl. (USA), vol.14, no.1, p.76-97 (Jan.-Feb. 1983). Translation of: *Fiz. Elem. Chastits & At. Yadra (USSR)*, vol.14, no.1, p.181-226 (Jan.-Feb. 1983). [received: Sept. 1983]

A review is given of experimental and theoretical investigations on collective acceleration of ions in straight relativistic electron beams, an area which was first studied by V.I. Veksler (1956), G.I. Budker (1956) and B.Ya. Fainberg (1956). The acceleration methods considered are compared in relation to their promise of resulting in viable accelerators in the range up to several hundred MeV per nucleon. (115 refs.)

112487 Infrared synchrotron radiation from electron storage rings. W.D.Duncan (Royal Obs., Edinburgh, Scotland), G.P.Williams.

Appl. Opt. (USA), vol.22, no.18, p.2914-23 (15 Sept. 1983). Simple and useful approximations, valid at infrared wavelengths, to the equations for synchrotron radiation are presented and used to quantify the brightness and power advantage of current synchrotron radiation light sources over conventional infrared broadband laboratory sources. The Daresbury Synchrotron Radiation Source (SRS) and the Brookhaven National Synchrotron Light Source (vacuum ultraviolet) [NSLS(VUV)] storage rings are used as examples in the calculation of the properties of infrared synchrotron radiation. The pulsed nature of the emission is also discussed, and potential areas of application for the brightness, power, and time structure advantages are presented. The use of infrared free electron lasers and undulators on the next generation of storage ring light sources is briefly considered. (35 refs.)

112488 Betatron energy stabilization system. Yu.V.Kuznetsov, E.V.Lazutin, Yu.A.Novikov, V.M.Sorvin (Nuclear Phys. Res. Inst., Moscow State Univ., Moscow, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1333-7 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.21-4 (Nov.-Dec. 1982). [received: Sept. 1983]

A system is described for the stabilization and control of the energy of a betatron. The system can operate both autonomously and in conjunction with a computer. Schematic diagrams are presented for the system control block, for the digital-analog converter, and for the comparison circuit. The stabilization system is made up mainly of integrated circuits of the series K155 and K140. (11 refs.)

112489 Study of the magnetic forces acting on the trim coils, for the Milan superconducting cyclotron. G.Bellomo, L.Serfini.

Report INFN/TC-83/7, Ist. Naz. Fis. Nucl., Milan, Italy (7 March 1983), 19 pp.

A three sector superconducting cyclotron, with a $K=800$ and a $K_{FOC}=200$, is under construction at the University of Milan. The machine will operate with average magnetic fields between 22 and 48 kGauss; the trimming of the field is obtained by the independent excitation of the two main coil sections (each one carrying up to 3500 A/cm²) and by 20 trim coils wound around the hills (with a max excitation of 4000 ampereturns each). The aim is to evaluate the forces acting on the trim coils because of the cyclotron magnetic field. Four trim coils, out of twenty, have been selected as representative of the entire set and the corresponding distribution of the forces has been computed. The results obtained are presented in some detail and their implications for the design of the mechanical structure of the trim coils are discussed. (4 refs.)

112490 Triggering and filtering in collider experiments. D.Notz (DESY, Hamburg, Germany).

Proceedings of the 1982 CERN School of Computing, Zinal, Valais, Switzerland, 29 Aug.-11 Sept. 1982 (Geneva, Switzerland: CERN 1983), p.229-36. Discusses rates for events and background in $p\bar{p}$ and e^+e^- storage rings. Electronic systems recognizing tracks within a few microseconds are presented. These systems work either in parallel or sequentially. (1 ref.)

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling: targets)

112491 The general concept for a spallation neutron source in the Federal Republic of Germany. G.S.Bauer (KFA Julich, Julich, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.234-42 (1982). [received: Sept. 1983]

In a collaborative effort between the two German nuclear research centres at Karlsruhe and at Julich, a reference concept for a spallation neutron source has been studied which would be suitable to satisfy the medium term needs in neutrons for fundamental research and to service a large number of other scientific disciplines as well. The reference facility, consisting of a high power proton linac for 5 mA time average current of 1.1 GeV protons and a rotating lead target with hybrid H₂O-D₂O moderators can deliver a thermal neutron

flux equivalent to 7×10^{14} cm⁻² s⁻¹ at the beam tube noses. Pulsed operation of the accelerator results in an intensity modulation of this flux at a repetition rate of 100 Hz with a peak flux of 1.3×10^{16} cm⁻² s⁻¹ and a pulse width of 510 μ s. Further possible improvements were considered, consisting in the use of uranium as target material and in the addition of a proton pulse compressor to increase the neutron peak flux especially in the epithermal energy range and to provide a time structure suitable for neutrino and muon research. To realize this concept in a fashion compatible with existing constraints while still serving a maximum number of users at the earliest possible date, a staged concept is being considered by KFA Julich. (17 refs.)

112492 Nuclear assessment of the DIANE target station. P.Cloth, D.Filges, R.Hecker (Inst. fur Reaktorenentwicklung, KFA Julich GmbH, Julich, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.243-52 (1982). [received: Sept. 1983]

Presents results of calculations that have been made for a spallation neutron source. The emphasis of this theoretical work has been directed toward assessing physics feasibility. Most of the calculations are related to predicting the neutronics output for a realistic target configuration with 'slow' and 'fast' moderators. The calculational approach has been to use the latest state-of-the-art radiation transport computer codes. The codes used allow three-dimensional target descriptions and employ Monte Carlo techniques, so it is possible to treat in detail the spallation reactions, the transport on the high-energy particles, low-energy neutrons and gammas created. An overview of the computer codes used is given. The main conclusion of the calculations is that, for the beam parameters of the proton accelerator (1100 MeV protons, average current of 5 milliamperes) and target parameters (target material of lead, clad with aluminium and cooled with water) considered, the peak and average thermal neutron flux goals of $\Phi_{th}=1.2 \times 10^{16}$, $\Phi_{th}=6.0 \times 10^{14}$ n cm⁻² s⁻¹ can be attained. Furthermore, results of the calculations for other important design questions, such as heating at the target and target station components, radiation environments for material damage and induced radioactivity are also described. (21 refs.)

112493 Behaviour of the spallation neutron source target wheel under thermal and mechanical loads. J.F.Stelzer (KFA Julich, Julich, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.253-8 (1982). [received: Sept. 1983]

Calculations dealing with the temperatures and stresses in the maximally loaded parts of the target wheel are described. They were carried out using the finite element method. There are three highly loaded areas: the outer housing, the beam window and the lead-filled target rods. The construction of the mathematical models is shown. The results are introduced and discussed. The design satisfies the mechanical demands. (11 refs.)

112494 Mechanical design of the target station DIANE of the German spallation neutron source project and its rotating target. H.Stechemesser (Zentralabteilung fur Allgemeine Technol., KFA Julich, Julich, Germany).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.259-63 (1982). [received: Sept. 1983]

The spallation neutron source is designed to substitute the beamhole reactors currently in use. Owing to the method of neutron production there are typical design features, which are described special for the spallation target, the surrounding shielding block and handling aspects. The design of the rotating wheel shaped target is lined out to give a good view to the detail design. (3 refs.)

112495 Dependence of the experimentally obtained age of the Am-Be neutrons ($\tau_{1.46}$) in water on the source-foil geometry. S.E.Simopoulos, D.J.Leonidou, M.G.Angelopoulos (Lab. of Nuclear Engng., Nat. Tech. Univ., Athens, Greece).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.293-4 (1982). [received: Sept. 1983]

In a previous publication by Simopoulos and Leonidou (1981) the measured age to indium resonance ($\tau_{1.46}$), in natural water, of neutrons from a 5 Curie Am-Be cylindrical source (diameter 1", length 1.5") was reported. This age was evaluated by the usual technique, i.e. from the saturation activity of pure indium foils (0.5" in diameter, 0.005" thick, 92.8 mg/cm²) enclosed in 0.020" thick cadmium boxes, positioned along the axis of the cylindrical source and facing one of its bases. The final average value of $\tau_{1.46}$ reported was: $\tau_{1.46}=65.2 \pm 1.5$ cm². This value was obtained without considering the possible combined effects of the finite size of the source and of the cubic water tank (1 m \times 1 m \times 1 m) used for the experiments. The possible effects of the above factors were investigated and a more representative value of the age $\tau_{1.46}$ was obtained when an arrangement of a finite Am-Be source and water tank was used and detailed measurements were performed. A short reference to the basic experimental procedure and the data reduction and pressing followed by a detailed description of the experiments and the results obtained are given. (3 refs.)

112496 Converting thermal neutrons into 14 MeV DT neutrons using the suprathermal fusion principle. W.Seifritz (Swiss Federal Inst. for Reactor Res., Wurenlingen, Switzerland).

Atomkernenerg. Kerntechnik. (Germany), vol.41, no.4, p.295-6 (1982). [received: Sept. 1983]

A severe problem to the experimental study of the neutronics of pure or hybrid fusion reactor blankets is the lack of a 14 MeV neutron source being strong enough to allow foil activation measurements up to a blanket thickness of at least 50 cm. It would be therefore preferable if thermal neutrons being abundantly available in fission reactors could be used for this task. (5 refs.)

112497 The new high intensity polarized proton and deuteron source for the Bonn isochronous cyclotron. H.-G.Mathews (Inst. fur Angewandte Phys., Univ. Bonn, Bonn, Germany), A.Kruger, S.Penselin, A.Weinig.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.155-64 (1 Aug. 1983).

An atomic-beam polarized ion source for the production of polarized protons and deuterons is described. Beam intensities of 160 μ A for polarized protons and deuterons are obtained at an emittance of 9π cm.rad./eV. Within the phase space accepted by the Bonn isochronous cyclotron 50 μ A of deuterons and 35 μ A of protons were measured. The atomic beam emerging from a liquid nitrogen cooled dissociator nozzle is polarized and focused by two tapered sextupole magnets. Two radiofrequency transitions can be mounted either before or behind the second sextupole, leading to theoretical values for deuterium vector and tensor polarizations of $P_z=\pm 1$ and $P_{zz}=-2$, respectively. The polarized atoms are ionized by electron impact inside a cold-cathode Penning ionizer working at a magnetic field of 4 T produced by a superconducting solenoid. The efficiency for this ionizer is estimated to be $\eta=6.2 \times 10^{-2}$. (11 refs.)

112498 Study of the production of metallic ions in the multiply charged ion source MINIMAFIOS. M.Delaunay, S.Dousson, R.Geller, B.Jacquot (CENG, Grenoble, France).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.165-9 (1 Aug. 1983). In French.

The authors show that multiply charged metallic ions can be produced inside an electron cyclotron resonance plasma (ECR) by utilizing directly the energy contained inside the plasma. The results corroborate the feasibility of the method. Experimental charge state distributions for ions of Al, Ni, Mo, W, Ta, Au etc. are shown. (4 refs.)

112499 Charged particle beam envelopes. E.V.Shpak (Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.171-8 (1 Aug. 1983).

A method for the calculation of charged particle beam envelopes of various shapes is proposed. Expressions for the envelopes are obtained both in the paraxial approximation and taking into account some kinds of aberration. The two-dimensional quadrupole lens is used to illustrate the possibility of finding the envelopes for cases where exact equations of the particle trajectories are known. (3 refs.)

112500 Envelope equation for a beam accelerated by a rotationally symmetric electrostatic field. Jiang Bin-Yao (Shanghai Inst. of Metall., Acad. of Sci. of China, Shanghai, China), P.Tangy, Xia Jin-Zhi.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.179-85 (1 Aug. 1983). In French.

The envelope equation for heavy ion beams accelerated in a rotationally symmetric electric field is set up. Two cases are considered: beams with uniform distribution in cross section and beams with non-uniform distribution for which the RMS envelopes equation is obtained. An example of application is presented and possible improvements of calculations are discussed. (9 refs.)

112501 Design of a passive magnetic shunt for the extraction of electron beams from a photon tagging spectrometer. R.M.Laszewski (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.195-200 (1 Aug. 1983).

A method is described in which a passive magnetic shunt is used to provide clean extraction of primary electron beams from a photon tagging spectrometer. For a wide range of magnetic fields and incident electron energies, the point at which the primary beam leaves the system can be very well localized. The design, fabrication and testing of the magnetic shunt are described. (10 refs.)

112502 Absolute beam intensity measurements with a 200 watt calorimeter. A.E.Vlieks, M.Hilgemeier, C.Rolfs (Inst. fur Kernphys., Univ. Munster, Munster, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.291-9 (1 Aug. 1983).

A calorimeter has been constructed for absolute intensity measurements of ion beams with up to 200 W power. The technical aspects and features of the calorimeter are described. (7 refs.)

112503 A versatile high intensity negative ion source. R.Middleton (Phys. Dept., Univ. of Pennsylvania, Philadelphia, PA, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.139-50 (1 Sept. 1983).

A new type of sputter negative ion source has been developed in which the sputter target and the surface ionizer are enclosed in a common chamber containing cesium vapor. Optimal neutral cesium coverage of the sputter target can be achieved resulting in efficient ionization and high intensities. Some typical negative ion currents are: 30 μA of $^{11}\text{B}^-$, 300 μA of $^{12}\text{C}^-$, 250 μA of $^{16}\text{O}^-$, 4 μA of $^{27}\text{Al}^-$, 200 μA of $^{28}\text{Si}^-$, 150 μA of $^{58}\text{Ni}^-$, 150 μA of $^{63}\text{Cu}^-$ and 200 μA of $^{197}\text{Au}^-$. Emission is relatively low, $\sim 2 \pi \text{ mm.mrad(MeV)}^{1/2}$ for 70% of the total current, and sputter targets can be changed in 5-10 min. Since the source operates efficiently with samples of a few milligrams and yields 5-10 μA of BeO^- ions from beryllium oxide and about 1 μA of $^{27}\text{Al}^-$ from aluminium oxide, it is likely to find application in accelerator mass spectrometry. (15 refs.)

112504 Fast kicker magnet system. L.J.Lindgren, A.Sandell, M.Eriksson (MAX Lab., Inst. of Phys., Lund, Sweden).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.175-8 (1 Sept. 1983).

A fast kicker magnet system has been developed to be used as a fast extraction device for electrons in a synchrotron. Measurements on pulse characteristics are presented. (6 refs.)

112505 Injection and extraction at MAX. L.J.Lindgren, M.Eriksson (MAX Lab., Inst. of Phys., Lund, Sweden).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.179-87 (1 Sept. 1983).

The MAX accelerator system will consist of a 100 MeV injector and a 550 MeV pulse-stretcher/storage ring. The authors describe the injection and extraction process. The third resonance extraction theory is outlined and discussed. (6 refs.)

112506 A superconducting accelerating cavity in PETRA. W.Bauer, A.Brandelik, A.Citron, F.Graf, L.Szecs (Kernforschungszentrum Karlsruhe, Univ. of Karlsruhe, Karlsruhe, Germany), D.Proch.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.189-99 (1 Sept. 1983).

To investigate the feasibility of superconducting accelerating cavities in electron-positron storage rings a single cell niobium cavity was constructed and tested in PETRA at DESY, Hamburg. The authors describe the experimental setup and summarize the results obtained. Accelerating field gradients of the order of 3 MV/m and Q -values of 10^9 can be obtained in an operating storage ring and maintained over many weeks. Synchrotron radiation impinging on the cavity surface does not affect the performance. Higher order mode excited by the beam were coupled out, their amplitudes were measured and agree with theory. PETRA could be operated at 5 GeV and 2 mA with the superconducting cavity alone. (21 refs.)

112507 Total neutron yields from 100 MeV protons on Pb and ^7Li targets. M.A.Lone, R.T.Jones, A.Okazaki, B.M.Townes, D.C.Santry, E.D.Earle (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada), J.K.P.Lee, J.M.Robson, R.B.Moore, L.Nikkinen, V.Raut.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.333-9 (1 Sept. 1983).

The neutron yield per proton from thick targets of Pb and ^7Li irradiated with 100 MeV protons has been measured and calculated. The water bath method was used to measure the neutron production and a Faraday cup was used to measure the proton beam current. Measured yields are 0.343 ± 0.021 for Pb and 0.123 ± 0.007 for ^7Li . Corresponding yields calculated with the nucleon-meson transport code NMTC are 0.363 ± 0.002 and 0.160 ± 0.001 .

Measured and calculated thermal neutron distributions in the water bath are also compared. (21 refs.)

112508 Electron beam focusing effects and matching conditions in plane periodic magnets. R.P.Walker (Sci. & Engng. Res. Council, Daresbury Lab., Warrington, England).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.497-504 (1 Sept. 1983).

Plane periodic magnets, undulators and wigglers, produce a focusing force in the nonbending plane which can be related simply to the RMS field strength. The effects that this can introduce in an electron storage ring are discussed and an optimum focusing condition for the electron beam is described. The role of the focusing in determining the performance of a free electron laser is also considered, leading to a different optimum matching condition in this case. (30 refs.)

112509 Production of circularly polarized light from synchrotron radiation in the vacuum ultraviolet region. P.D.Johnson, N.V.Smith (Bell Labs., Murray Hill, NJ, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.505-8 (1 Sept. 1983).

The well-known three-reflection polarizer can be used to convert linearly polarized synchrotron radiation to circular polarization. Geometrical parameters are presented for the production of circularly polarized light in the photon energy range 5-30 eV using Au or Pt mirrors. (14 refs.)

112510 PHOCCA: a Monte Carlo program to calculate the characteristics of a beam of photons produced by annihilation and bremsstrahlung of relativistic positrons. E.De Sanctis, V.Lucherini (INFN, Lab. Nazionali di Frascati, Frascati, Italy), V.Bellini.

Comput. Phys. Commun. (Netherlands), vol.30, no.1, p.71-85 (July-Aug. 1983).

The program PHOCCA calculates the absolute energy spectra, the radial and vertical profiles and the angular distributions of annihilation and bremsstrahlung photons from intermediate energy positrons. The energy spread, the energy loss and the multiple scattering of the positrons in the annihilation target are taken into account. Moreover the positron emittance, the positron incidence angle and the finite angular acceptance of the photon collimation channel are explicitly considered. (3 refs.)

112511 A nanosecond pulsed electron gun system for BEPC. Gu Meng-Ping, Zhu Guo-Hui, Qian Zhu-Ming, Mi Jian-Lin (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.4, pt.2, p.2962-4 (Aug. 1983).

(1983 Particle Accelerator Conference. Accelerator Engineering and Technology, Santa Fe, NM, USA, 21-23 March 1983).

A nanosecond pulsed electron gun has been installed at IHEP in Beijing. Two types of pulser have been tested for the fast pulsed gun. Instead of the hybrid fast pulser, a new transistor avalanche pulser was developed. 1.1 amp beam pulse current from the gun has already been obtained. Preliminary test and details of the gun system are presented. (3 refs.)

112512 Neutralizer for Hall-current accelerator. J.J.Cuomo, H.R.Kaufman (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.26, no.1, p.19-21 (June 1983).

An improved neutralizer is described which is located at the center of the Hall accelerator, and is preferably a hollow cathode electron source. (no refs.)

112513 Electron gun with plasma emitter made up of vacuum arcs. S.P.Bugaev, A.I.Klimov, S.M.Chesnokov (Inst. of High-Current Electronics, Acad. of Sci., Tomsk, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1436-8 (Nov.-Dec. 1982).

Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.110-12 (Nov.-Dec. 1982).

An electron gun with a plasma emitter made up of several hot vacuum arcs was experimentally investigated. The electron-beam current pulse duration is $\sim 200 \mu\text{s}$. The current density at the plasma cathode reached A/cm^2 at 24 kV. (4 refs.)

112514 A 500-kV vacuum lead for a high-current quasistationary electron accelerator with a heated cathode. G.N.Antipov, S.V.Rybalov, V.D.Sarbee.

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1438-40 (Nov.-Dec. 1982).

Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.112-14 (Nov.-Dec. 1982).

The design of a high-voltage vacuum lead is described for an electron accelerator with a heated cathode. Results from tests on the electrical strength are given which show that the lead can be used up to 500 kV and a stationary cathode heating power of about 20 kW. (3 refs.)

112515 Resistance thermometer for ion-beam calorimetry. S.N.Dolya, V.A.Sviridov, V.P.Tokarskii (Joint Nuclear Res. Inst., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.2, p.1443-5 (Nov.-Dec. 1982).

Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.117-18 (Nov.-Dec. 1982).

A new type of calorimeter is described for measuring the parameters of low-energy ion beams. The sensitive material is a wire of diameter 10-15 μm . Test results with ion beams are described. The sensitivity is up to 200°C/J . (3 refs.)

112516 Optimization of a permanent magnet undulator for free electron laser studies on the ACO storage ring. J.M.Ortega, C.Bazin, D.A.G.Deacon (Lab. LURE, Univ. de Paris-Sud, Orsay, France).

J. Appl. Phys. (USA), vol.54, no.9, p.4776-83 (Sept. 1983).

Describes the magnetic design problems involved in the realization of the permanent magnetic undulator 'Nouvel Onduleur pour l'Etude du Laser (NOEL)' currently being used for the free electron laser experiments on the storage ring ACO. The undulator has been compensated for the magnetic imperfections of the magnet elements used for its construction. Each pole piece was made from two elements so that the authors could cancel out the transverse field errors. Each undulator pole was selected from a two-dimensional magnet distribution graph which was drawn with the results of a set of Hall-probe measurements. Magnetic measurements of the assembled undulator as well as the first experiments on the ACO storage ring indicate that the method has been successful. (16 refs.)

112517 Possible application of nuclear resonance fluorescence to study surface effects. L.Wielopolski, D.Vartsky, S.H.Cohn (Medical Res. Center, Brookhaven Nat. Lab., Upton, NY, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5449-50 (Sept. 1983).

Observations were made of the differences between the iron nuclear resonance fluorescence yield from a gaseous $^{59}\text{MnCl}_2$ source in a clear fused quartz vial and a source in a clear fused silica (Suprasil) vial. The nuclear resonance fluorescence may be applied to study surface effects in materials undergoing radiation damage. (6 refs.)

112518 **Resistive wall flute stability of magnetically guided relativistic electron beams.** R.G.Kleva (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA), E.Ott, P.Sprangle. *Phys. Fluids (USA)*, vol.26, no.9, p.2689-97 (Sept. 1983). The resistive wall stability of an electron beam is studied, and application of the theory to the modified betatron accelerator is considered. Only flute-like perturbations are analyzed ($n=0$, $l\geq 1$, where n and l are the toroidal and poloidal mode numbers, respectively). Included in the analysis are the effects of relativistic velocities, equilibrium and perturbed self-electromagnetic fields, and resonant particle effects due to density and velocity profiles. The principal results are (1) $l\geq 2$ modes are much more difficult to stabilize than is the $l=1$ mode; (2) the velocity gradient along the beam can provide an important stabilizing mechanism; (3) the stabilizing effect of the density gradient is reduced by relativistic effects; and (4) magnetic perturbations can be important even for nonrelativistic beams. (11 refs.)

112519 **The time response of the ferrite loaded cavity and stability of bias autotuning system.** Yan Tai-xuan, Sun Li-bo (Inst. of High Energy Phys., Acad. Sinica, Peking, China). *Phys. Energ. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.346-54 (May 1983). In Chinese. A state space model is described, the time response of ferrite loaded cavity is proposed and a new digital measuring method devised. Results of actual measurement on the model cavity are given. On these bases the stability of stationary state of bias autotuning system to fast external perturbation is discussed. (10 refs.)

112520 **Data processor for the magnet with curvature.** Du Wen-fu (Inst. of High Energy Phys., Acad. Sinica, Peking, China). *Phys. Energ. Fortis & Phys. Nucl. (China)*, vol.7, no.3, p.395-400 (May 1983). In Chinese. The data processor of the magnetic field in the bending magnet with curvature is described using a normal measurement device, moving along straight line. A formula for data transformation is introduced. The results show that it would have approximately no influence to the fitting coefficients in the longitudinal direction. (1 ref.)

112521 **Californium-252 as a source of subthermal neutrons.** J.J.Antal (Army Materials & Mech. Res. Center, Watertown, MA, USA). Neutron Radiography, Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.689-93. Radiography with subthermal (cold) neutrons is becoming increasingly interesting to those concerned with the evaluation of new composite structural materials. A subthermal neutron beam of sufficiently high intensity for radiography is difficult to obtain from common neutron sources. Californium-252 as a source of subthermal neutrons was explored and found to be an extremely efficient source, but one of still marginal applicability without further novel source development. (2 refs.)

112522 **Production of a very high intensity polarized ion beam and experiments of spin transfer reactions.** A.Isoya, T.Nakashima, K.Sagara, K.Kobayashi, H.Nakamura, K.Aita, O.Masutomi, K.Takada (Dept. of Phys., Kyushu Univ., Fukuoka, Japan). Proceedings of the 1983 RCNP International Symposium on Light Ion Reaction Mechanism, Osaka, Japan, 16-20 May 1983 (Osaka, Japan: Osaka University 1983), p.896-900. At the tandem laboratory of Kyushu University experimental studies of the spin transfer reactions, particularly induced by the polarized deuteron beam, are being planned and most of the facilities for these experiments have been completed. The authors describe several new features of the equipment. (no refs.)

112523 **Evolution of control systems for accelerators.** M.C.Crowley-Milling (CERN, Geneva, Switzerland). Proceedings of the 1982 CERN School of Computing, Zinal, Valais, Switzerland, 29 Aug.-11 Sept. 1982 (Geneva, Switzerland: CERN 1983), p.271-304. Discusses the historical development of the accelerators. The author details the requirements for the control system. The various aspects of CAMAC and process control are examined. Software aspects are explored. (no refs.)

29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

112524 **Determination of the multipolarity of prompt electromagnetic transitions from angular distributions of conversion electrons. II. Spectrometer and measurements.** H.R.Faust (Inst. Laue-Langevin, Grenoble, France), H.Klewe-Nebenius, H.Rebel, K.Wisslak. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.277-83 (1 Aug. 1983). For pt.1 see *ibid.*, vol.213, no.2-3, p.271-5 (1983). A spectrometer to measure the angular distribution of conversion electrons in charged particle induced reactions is described. The spectrometer consists of a magnetic filter built with small permanent magnets and a Si(Li) detector. The parameters of the instrument are discussed and attenuation factors due to the finite solid angles are evaluated. Spectra of conversion electrons following the reaction ¹⁶⁹Tm(d,xn) and ¹⁸²Os(d,xn) at an incident deuteron energy of $E_d=52$ MeV taken at different angles are shown. Angular distribution coefficients are calculated and the evaluation of the data in the framework of the formalism developed in part I is demonstrated. (10 refs.)

112525 **Time focusing and resolution in resonance detector neutron spectrometers.** J.M.Carpenter, N.Watanabe (Nat. Lab. for High Energy Phys., Ibaraki, Japan). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.311-16 (1 Aug. 1983). Nuclear recoil produces a variation in the time of arrival of neutrons scattered through different angles in pulsed-source resonance detector neutron spectrometers. The coupled variation of recoil energy shifts, scattering angles and lengths of different paths from source to sample to detector leads to conditions on the orientation of source, sample and detector which minimize the resolution of these spectrometers. The conditions depend upon the mass of the scatterer, the excitation energy of the recoiling unit, the mean scattering angle and relative incident and scattered neutron flight paths, and apply strictly only for a single value of the excitation energy. The authors develop general expressions for the geometric contributions to the resolution, from which the focusing conditions emerge. The focusing effect on the resolution is significant and is similar to that in time of flight diffractometers. (10 refs.)

112526 **A multi-microprocessor neutron spectrometer computer interface system.** R.Berliner, J.Sudol, G.Moum (Univ. of Missouri, Columbia, MO, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.333-42 (1 Aug. 1983). A novel computer interface system for neutron or X-ray diffraction instrumentation is described. Consisting of a set of microprocessor controllers, it provides a simple and flexible means of instrument control. (5 refs.)

112527 **An automatic gamma spectrometer for activation analysis.** L.Vanska, R.J.Rosenberg, V.Pitkanen (Reactor Lab., Tech. Res. Centre of Finland, Espoo, Finland). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.343-7 (1 Aug. 1983). An automatic gamma spectrometer for activation analysis has been developed at the Technical Research Centre of Finland. The online system comprises a sample changer for up to 120 samples, detector, multichannel analyser, microcomputer programmed with BASIC language and input/output devices. (2 refs.)

112528 **The QDDQ magnet spectrometer 'BIG KARL'.** S.A.Martin, A.Hardt, J.Meissburger, G.P.A.Berg, U.Hacker, W.Hurlimann, J.G.M.Romer, T.Sagefka, A.Retz, O.W.B.Schult (Inst. fur Kernphys., Kernforschungsanlage Julich, Julich, Germany), K.L.Brown, K.Halbach. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.281-303 (1 Sept. 1983). A magnet spectrometer consisting of two quadrupoles, two dipole magnets and another larger quadrupole in front of the detector was designed and installed at the nuclear research institute of the KFA Julich. It has been used for charged-particle spectroscopy as the isochronous cyclotron since early 1979. Special features of the spectrometer are variable and high dispersion, coils for higher order field corrections in the dipole magnets and a focal plane perpendicular to the optical axis. A large mass-energy product of $mE/q^2 < 540$ u.MeV, an angular acceptance of $d\Omega < 12.5$ msr, a high resolving power of $p/\Delta p$ up to 3×10^4 and the possibility of kinematical corrections up to $K=0.8$ make the instrument a very versatile tool for many experiments in the fields of nuclear and atomic physics. (51 refs.)

112529 A microprocessor controlled spectrometer for frequency modulation Mossbauer measurements. T.Obenhuber, A.Forster, W.Potzel, G.M.Kalvius (Phys. Dept., Tech. Univ. Munchen, Garching, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.361-79 (1 Sept. 1983).

A Mossbauer spectrometer for the frequency modulation technique using piezo-quartzes is described. All its subsystems like the wave form synthesizer, the voltage divider and the data storage system are centrally controlled by a microprocessor. The system has been used for precision determination of hyperfine splittings of the very high resolution 93.3 keV Mossbauer resonance in ^{67}Zn . (22 refs.)

112530 Simultaneous determination of exponential background and Gaussian peak functions in gamma ray scintillation spectrometers by maximum likelihood technique. P.Eisler, T.Lwin, G.Nelson, S.Youl (CSIRO, Port Melbourne, Australia).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.421-9 (1 Sept. 1983).

Simultaneous fitting of peaks and background functions from gamma-ray spectrometry using multichannel pulse height analysis is considered. The specific case of Gaussian peak and exponential background is treated in detail with respect to simultaneous estimation of both functions by using a technique which incorporates maximum likelihood method as well as a graphical method. Theoretical expressions for the standard errors of the estimates are also obtained. The technique is demonstrated for two experimental data sets. (5 refs.)

112531 Background estimation for gamma-ray spectrometry.

D.D.Burgess, R.J.Tervo (McMaster Univ., Hamilton, Ontario, Canada).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.431-4 (1 Sept. 1983).

An algorithm has been developed and implemented for estimation of the spectral background of high-resolution gamma-ray spectra. A digital filter is used to identify peak-free regions of spectra. (9 refs.)

112532 A pseudorandom pulser technique for the correction of dead-time and pile-up losses in γ -ray spectrometry. G.Dorfel, W.Kluge, M.Kubisch (Zentralinst. fur Festkorperphys. und Werkstofforschung, Acad. der Wissenschaften, Dresden, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.435-40 (1 Sept. 1983).

A pseudorandom pulser and its application in high precision gamma-ray spectrometry is described. A pulse train suitable for modelling dead-time and pile-up effects is obtained by an AND-connection of delayed pulse sequences delivered by a maximum length shift register generator. The heart of the problem consists in finding the appropriate delay indices and in implementing these indices by 'add and shift'. The related conditions and rules are described. These conditions ensure the occurrence of multiple pulses according to the binomial and Poisson distributions, respectively, within a predetermined range of multiplicity as well as ensuring other statistical properties. Results are given in a form comparable with the description of the results of a well-known international test. (18 refs.)

112533 Derivative method unfolding of gamma-ray spectra from NE-213 spectrometers. J.K.Korsah (Phys. Dept., Univ. of Maine, Orono, ME, UA), W.H.Miller.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.441-3 (1 Sept. 1983).

Derivative method unfolding used in MATXUF for on-line analysis of fast neutron spectra has been applied to the analysis of gamma-ray spectra measured by an NE-213 liquid scintillation spectrometer. To eliminate the negative fluxes in the unfolded spectrum created by the Compton scatter behaviour in the plateau portion of the knee response correcting equations using a linearized approximation to the electron recoil spectrum has been developed and incorporated in the MATXUF unfolding code. (11 refs.)

112534 The determination of X-ray spectra from attenuation data. II. Experimental results. H.M.Kramer (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.445-50 (1 Sept. 1983).

For pt.I see *ibid.*, vol.213, p.373 (1983). After the principal limitations of any attenuation analysis in a previous publication have been sounded, experimental data are presented and analyzed critically in the paper work. The histogram spectra determined approximate the (known) input spectra quite well and are useful for the calculation of other spectral-dependent information such as, for example, attenuation curves for a different material. Various experimentally relevant errors and their relative importance are discussed. The tolerances of the absorber thickness and those values of the mass attenuation coefficients associated with the high energy end of a spectrum must be subject to the most stringent requirements. (5 refs.)

112535 A wire-chamber spectrometer for muon spin rotation. R.Tedeschi (CERN, Geneva, Switzerland), P.Podini, R.De Renzi, A.P.Jeavons, R.Magnanini, L.O.Norlin.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.509-16 (1 Sept. 1983).

The authors report on the development of a spectrometer for muon spin rotation based on multiwire proportional chambers. The coordinates provided by telescopes each composed of two chambers are used to reconstruct the muon and the positron trajectories in $\mu^+ \rightarrow e^+ + \nu_e + \bar{\nu}_\mu$ decay. A real-time analysis program verifies that the two tracks intersect within the target: this constitutes a very stringent test to veto events which do not correspond to a muon decay. The results of some experiments are given in order to illustrate the field of application of this spectrometer. (12 refs.)

112536 Combined spectrometer for small-angle and diffuse scattering of cold neutrons. V.S.Bedbenov, G.A.Oganezov (Phys. Inst., Acad. of Sci., Georgian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1340-4 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.28-31 (Nov.-Dec. 1982). [received: Sept. 1983]

Describes a fully automated combined spectrometer for small-angle and diffuse scattering of cold neutrons, built for one of the horizontal channels of the IRT-M nuclear reactor of the Physics Institute of the Georgian Academy of Sciences. It is based on a new methodological approach that permits qualitative improvements in the spectral purity of the incident long-wave neutron beam, in the resolving power of the spectrometer, and in its transmission when used in experiments on the transmission and small-angle and diffuse scattering of neutrons. A distinguishing feature of the developed facility is the possibility of measuring the dependence of the cold-neutron scattering intensity on the momentum transfer both in time-of-flight measurements and when the usual stationary method is used. (10 refs.)

112537 Stabilized scintillation spectrometer for scattered low-energy gamma radiation. O.M.Anshakov, V.A.Chudakov, A.L.Kholmet'skii, V.I.Gurinovich (State Univ., Minsk, Belorussian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1345-8 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.31-4 (Nov.-Dec. 1982). [received: Sept. 1983]

A spectrometer for scattered gamma radiation with differential stabilization against an X-ray fluorescence reference peak is described. The reference signal is produced in a special target made of barium titanate. The results of temperature tests of the spectrometer are presented. (16 refs.)

112538 A method of data analysis of the magnetic spectrometer. Shen Wen-qing (Inst. of Modern Phys., Acad. Sinica, Peking, China).

Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.3, p.361-69 (May 1983). In Chinese.

A method of data analysis of the magnetic spectrometer with heavy ion is discussed. The determination of the charge state, the atomic number, the atomic mass and the energy of reaction products are described. The paper also deals with the software correction of $B\rho$ non-linear dispersion, kinematics and the difference of flight paths. (6 refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

112539 Precise angular distribution measurements for high energetic ions. H.Lettau, H.G.Bohlen, H.Rossner, W.von Oertzen, M.Martin (Hahn-Meitner-Inst., KFA Berlin GmbH, Berlin, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.187-94 (1 Aug. 1983).

The reliability of a position sensitive parallel plate avalanche counter as a start detector at the entrance of a magnetic spectrometer is demonstrated. Implications for experiments with high energy, heavy ions are discussed from the results. (18 refs.)

112540 First measurement of efficiency and precision of CCD detectors for high energy physics. R.Bailey, C.J.S.Damerell, R.L.English, A.R.Gillman, A.L.Lintern, S.J.Watts, F.J.Wickens (Rutherford Appleton Lab., Chilton, Didcot, England).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.201-15 (1 Aug. 1983).

It has been known for some time that a 2-dimensional charge-coupled device (CCD) might be used for detecting high energy particles with high precision and excellent 2-track resolution. Such detectors could be used to distinguish between prompt tracks and decay products in events producing short-lived particles (heavy leptons, charm, beauty, etc.). The authors present results in which a telescope of CCD detectors has been operated in a beam of high energy particles. The main results are that even these early detectors have excellent performance characteristics, namely efficiency for track detection of $98 \pm 2\%$ per plane, spatial resolution of $4.3 \mu\text{m}$ and $6.1 \mu\text{m}$ in two orthogonal directions and 2-track resolution of $40 \mu\text{m}$ in space. (9 refs.)

112541 Development of a small high-pressure streamer chamber for charm-lifetime measurements. V.Eckardt, S.Wenig (Max-Planck-Inst. fur Phys. und Astrophys., Munchen, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.217-21 (1 Aug. 1983).

The spatial resolution in a streamer chamber is investigated as a function of gas pressure in the chamber. For this purpose a small streamer chamber with a track sensitive volume of 50 mm diameter and 23 mm gap has been constructed and operated between 5 and 20 atm pressure. In this pressure range streamer densities from 43 to 67 streamers per centimeter were found. The track width 2σ is mainly determined by the diffusion of the electrons and shrinks proportionally to $1/\sqrt{p}$. In addition, the influence of a magnetic field of 1.8 T on the diffusion was studied. At 20 atm one reaches a σ of $70 \mu\text{m}$ in space, which allows a measurement of charmed particle lifetimes as short as 10^{-13} s. (7 refs.)

112542 Tests of gas sampling electromagnet shower calorimeter. A.Barbaro-Galtieri, W.Carithers, C.Day, K.J.Johnson, W.A.Wenzel, H.Videau (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.223-41 (1 Aug. 1983).

An electromagnet shower gas-sampling calorimeter has been tested in both Geiger and proportional discharge modes for incident electron energies in the range 0.125-16 GeV. The 0.2 radiation length-thick layers were lead-fiberglass laminates with cathode strips normal to the sense wires. The $5 \times 10 \text{ mm}^2$ Geiger cells were formed with uniformly spaced nylon fibers perpendicular to the wires. Proportional mode measurements were carried out in the pressure range 1-10 atm. A Monte Carlo simulation is in good agreement with measured shower characteristics and has been used to predict the behavior for oblique angles of incidence and for various Geiger cell dimensions. (8 refs.)

112543 Effects of space charge, leakage currents and diffusion in large planar electrodeless drift chambers. C.Becker, W.Weihns, G.Zech (Dept. of Phys., Siegen Univ., Siegen, Germany).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.243-9 (1 Aug. 1983).

The authors calculate the effects of space charges, leakage currents and positive ion diffusion in large planar electrodeless drift chambers. Results are in qualitative agreement with measurements of the gas amplification and leakage currents at different rates of irradiation. Consequences on the construction of chambers and on their applications are discussed. (7 refs.)

112544 A modular NaI(Tl) detector for 20-1000 MeV photons. P.Blum, R.Guigas, H.Koch, M.Meyer, H.Poth, U.Raich, B.Richter (Inst. für Experimentelle Kernphys., Univ. Karlsruhe, Karlsruhe, Germany), G.Backenstoss, M.Hasinoff, P.Pavlopoulos, J.Repond, L.Tauscher, D.Troster, L.Adiels, I.Bergstrom, K.Fransson, A.Kerek, M.Suffert, K.Zioutas. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.251-9 (1 Aug. 1983).
A detector consisting of 54 NaI (Ti) modules is described. The detector has been optimized for the detection of 20-1000 MeV photons. An energy resolution (FWHM) of 5.5% at 130 MeV could be attained and the stability has been better than 1% over several months. (5 refs.)

112545 A new scintillator and wavelength shifter. T.Kamon, K.Kondo, A.Yamashita (Inst. of Phys., Univ. of Tsukuba, Ibaraki, Japan), T.Shimizu, L.Nodulman. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.261-9 (1 Aug. 1983).
The authors have developed a new type of scintillator and a wavelength shifter to be used for high energy particle calorimeters. To obtain a long attenuation length, two kinds of fluors are mixed in a polystyrene base. The wavelength shifter has a new material matching its absorption spectrum to the wavelength of the scintillation light. Their common characteristics are a relatively high light output and a long attenuation length with a reasonable cost. (7 refs.)

112546 A threshold Cherenkov counter for isotopic identification of high-energy heavy ions. J.D.Stevenson, J.A.Musser (Dept. of Phys., Univ. of California, Berkeley, CA, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.285-9 (1 Aug. 1983).
The authors have developed an apparatus for isotope identification of heavy-ion projectile fragments with energies from ~330 to 600 MeV/nucleon. The detector uses a Cherenkov intensity measurement in conjunction with a measurement of magnetic rigidity to determine mass. An advantage of this technique is that it allows isotope identification of projectile fragments with higher energies than are possible for 'stopping type' detectors. Higher fragment energies allow the use of much thicker targets and, therefore, provide higher sensitivity to rare isotopes. In a recent test of the apparatus using a 670 MeV/nucleon ^{20}Ne beam and a 30 g/cm² aluminum target a mass resolution of $\sigma_A = 0.2$ amu was obtained for projectile fragments with charges $5 \leq Z \leq 9$. (6 refs.)

112547 The prompt response of bismuth germanate and NaI(Tl) scintillation detectors to fast neutrons. O.Hausser, M.A.Lone, T.K.Alexander, S.A.Kushneriuk (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada), J.Gascon. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.301-9 (1 Aug. 1983).
Spectral distributions and yields of scintillation pulses from the prompt interaction of neutrons with 7.6 cm diameter \times 7.6 cm long bismuth germanate (BGO) and NaI(Tl) detectors have been measured. Neutrons at energies between 0.4 and 10 MeV were produced by the $^7\text{Li}(p,n)$ and the $^{197}\text{Au}(p,n)$ reactions, respectively, and identified by their time-of-flight relative to the pulsed proton beam. For both scintillators the neutron response is dominated by $(n,n'\gamma)$ reactions, and the efficiencies are in qualitative agreement with simple estimates that depend on the non-elastic and elastic cross sections and on two geometrical factors. Compared to NaI(Tl), BGO exhibits a much superior gamma-ray-to-neutron detection ratio. (25 refs.)

112548 An arsenic-activation detector for bursts of 2.5 and 14 MeV neutrons. E.L.Jacobs, S.D.Bonaparte, P.D.Thacher (Sandia Nat. Lab., Albuquerque, NM, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.387-92 (1 Aug. 1983).
An activation detector has been developed for measuring the output of pulsed neutron generators. This detector utilises the $^{75}\text{As}(n, n')^{75m}\text{As}$ reaction and detection of the 0.3 MeV gamma rays from $^{75m}\text{As}(\tau_{1/2} = 17 \text{ ms})$ by a plastic scintillator. The efficiency in counts per incident neutron is about 0.25% at 2.5 MeV and 0.35% at 14 MeV. (29 refs.)

112549 The design and calibration of precision drift chambers for use in a gluonium search experiment at the CERN ISR. M.G.Albrow (Rutherford Appleton Lab., Didcot, England), N.J.Beadle, A.A.Carter, J.R.Carter, P.C.Cecil, S.-U.Chung, D.J.A.Cockerill, W.M.Evans, M.D.Gibson, M.J.Goodrick, J.Hiddleston, N.A.McCubbin, T.W.Pritchard, D.P.Weygand. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.201-8 (1 Sept. 1983).
Describes the design, construction and calibration of a set of high precision drift chambers. The precise coordinate ($\sigma \sim 120 \mu\text{m}$) is determined by drift time measurement, with the orthogonal coordinate given by the charge division method ($\sigma \sim 1.2 \text{ mm}$). The chambers have been calibrated using a well-defined laser beam. Their use within a gluonium search experiment at the CERN ISR is also described. (3 refs.)

112550 Particle identification in the relativistic rise region using a longitudinal drift chamber. R.Arai, J.Bensinger, H.Boerner, Y.Fukushima, K.Hayashi, N.Ishihara, S.Inaba, T.Kohriki, S.Nakamura, K.Ogawa, F.Takasaka, Y.Unno, Y.Watase (KEK, Nat. Lab. for High Energy Phys., Ibaraki-Ken, Japan). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.209-16 (1 Sept. 1983).
Particle identification by energy loss measurement was tested using a longitudinal drift chamber equipped with a 25 MHz flash ADC. For 3 GeV/c pions the resolution σ_E/E was about 5%. The separation between pions and protons at this momentum was about 4 standard deviations. The influence of a magnetic field was examined. The deterioration of the separation was less than 15% up to a field strength of 5.2 kG. (7 refs.)

112551 MARS a fine grain aluminium-liquid argon calorimeter. C.Cerri (INFN, Pisa, Italy), S.P.Denisov, N.Krasnokutsky, S.A.Medved, V.S.Mikhailov, N.I.Naumov, S.A.Polovikov, E.A.Rasuvayev, F.Sergiampietri, R.S.Shulvalov, D.A.Stoyanova. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.271-35 (1 Sept. 1983).
The performance of a fine grain liquid argon calorimeter with aluminium electrodes has been studied. Measurements have been performed with 13.3-35 GeV/c electrons, muons and pions. The fine sampling structure and the large fraction of active absorber in this detector allowed an energy resolution for electrons of $\sigma(E)/E = \sqrt{(0.08/E)^2 + (0.036/\sqrt{E})^2}$ to be reached. The space and angular resolutions for electromagnetic showers can be represented as $\sigma(x) = \sqrt{(38.5/E)^2 + (12.8/\sqrt{E})^2} \text{ mm}$ and $\sigma(\theta) = \sqrt{(87.3/E)^2 + (33.8/\sqrt{E})^2} \text{ mrad}$. Due to the detailed measurements of the shower development a good electron/hadron discrimination is achieved. The low noise allows also the detection and identification of muons. (12 refs.)

112552 A prototype sampling calorimeter with photodiode readout (SPED). W.Kononenko, W.Selove, G.E.Theodosiou, R.Van Berg (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.237-43 (1 Sept. 1983).
The authors have built and tested a new type of sampling calorimeter using scintillator as the material, and thin vacuum photodiodes for signal readout, the new feature. They measure an energy resolution of about $22\%/\sqrt{E}$ for electrons of 10-37.5 GeV. For muons the signal to noise ratio is about 2.4 corresponding to about 1000 pe/cm of scintillator. Important merits of such a design such as the excellent gain stability (photodetector gain=1), absence of the need for high voltages, and system simplicity in construction and operation, have been demonstrated. (2 refs.)

112553 A study of bubble chamber operating conditions for holographic image recording. J.L.Benichou, A.Herve, K.E.Johansson, P.Lecoq, P.Olivier, J.Pothier, G.Waurick, E.Wiatrowski (CERN, Geneva, Switzerland), R.Roosen, S.P.K.Tavernier, G.van Beek, O.R.Williams. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.245-51 (1 Sept. 1983).
Results of a systematic study of operating conditions for holographic image recording in a heavy liquid rapid cycling bubble chamber are presented. The authors find that the limiting phenomenon is the turbulence generated by the growth and recompression of the bubbles. To minimize this effect it is necessary to operate the chamber at high temperature where the bubble growth is slow. A total of 40000 useful holograms were recorded in the NA25 experiment at CERN. Typical running conditions were 10 Hz cycling rate, 80 beam tracks per expansion and a bubble density of 95 bubbles per cm. The bubble diameter was 12 μm . (7 refs.)

112554 Charge collection in silicon strip detectors. E.Belau, R.Klanner, G.Lutz, E.Neugebauer, H.J.Seebrunner, A.Wylie (Max-Planck Inst. für Phys. und Astrophys., Werner-Heisenberg-Inst., Munich, Germany), T.Bohringer, L.Hubbeling, P.Weilhammer, J.Kemmer, U.Kotz, M.Riebsell. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.253-60 (1 Sept. 1983).
The charge collection in silicon detectors has been studied by measuring the response to high-energy particles of a 20 μm pitch strip detector as a function of applied voltage and magnetic field. The results are well described by a simple model. The model is used to predict the spatial resolution of silicon strip detector and to propose a detectors and to propose a detector with optimized spatial resolution. (8 refs.)

112555 Electron identification beyond 1 GeV by means of transition radiation. A.Bungener, B.Koppitz, R.van Staa, P.Stahelin (II Inst. für Experimentalphys., Univ. Hamburg, Hamburg, Germany), M.Holder. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.261-8 (1 Sept. 1983).
The authors report on measurements with different configurations of transition radiation detectors, performed with electrons in the energy range between 0.75 GeV and 6 GeV. The radiator materials were foils of polyethylene or fibres of polypropylene or carbon. The multiwire proportional chambers for photon detection were operated with krypton, xenon or a mixture of xenon and argon. The transition radiation yield is compared to theory, and the pion rejection power is reported. It is shown that a very effective particle discrimination can be obtained from a rather simple detector configuration of moderate thickness, low weight and low cost. (22 refs.)

112556 Photomultiplier gain tuning system. F.Binon, S.V.Donskov, P.Duteil, M.Gouanere, V.A.Kachanov, A.V.Kulik, D.Michotte, Yu.V.Mikhailov, J.P.Peigneux, Yu.D.Prokoshkin, A.V.Singovsky, J.P.Stroot (Joint Experiment of IHEP, Serpukhov, USSR). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.269-72 (1 Sept. 1983).
Most high energy physics experiments today make use of a large number of photomultipliers (PM). The setting and the tuning of the high voltage on the photomultiplier dividers need automatic devices. A few of these have been developed and work satisfactorily. Nevertheless the authors describe a highly reliable system which is definitely cheaper to build and to maintain in most cases and which is particularly suited for large calorimeters with thousands of PM. (4 refs.)

112557 A simple method for direct compensation for kinematic energy spread using a silicon PSD. J.B.A.England, S.D.Hoath (Dept. of Phys., Univ. of Birmingham, Birmingham, England), T.R.Ophel, B.R.Fulton. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.305-9 (1 Sept. 1983).
A simple method of compensating for the kinematic energy spread of the particles from a nuclear reaction detected in a silicon PSD is described. The technique relies on a suitable choice of the series resistor for the reaction of interest and the degree of compensation is shown to be equivalent to the first order correction for the acceptance of a magnetic spectrometer. Experimental results using recoil protons, elastically scattered alpha-particles and carbon ions from a heavy ion induced reaction illustrate the practical application and success of the technique. The limit of the compensation for light ions is set by the resistive noise in the 'energy \times position' signal while for heavy ions the nuclear scattering spread sets the lower limit. (3 refs.)

112558 A multi-purpose NaI(Tl) detector system. S.Elfstrom, L.Hildingson, D.Jerrestam, T.Lindblad (Res. Inst. of Phys., Stockholm, Sweden). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.311-16 (1 Sept. 1983).
A multi-purpose detector system consisting of six hexagonal NaI(Tl) detectors is described. The detectors can be arranged as a total energy spectrometer or together with a Ge(Li) detector as a Compton suppression device. The detectors can also be used individually for detection of γ -ray energies in for example, E_γ - E_γ correlation measurements. (15 refs.)

112559 An interactive system for emulsion data acquisition. G.Baroni, S.Di Liberto, P.Ginobbi, F.Meddi, S.Petrera, G.Romano, C.Sgarbi (Istituto di Fisica, Univ. di Roma, Rome, Italy). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.381-4 (1 Sept. 1983).
The authors describe an interactive system, based on a micro-processor, for the acquisition and elaboration of nuclear emulsion measurements. The device consists of a Koritska R_4 microscope coupled with a telecamera and with a motor driven stage for automatic displacement in the three directions. Both the pair of internal coordinates and the three external coordinates are digitized. The interactive management of the system is carried out with a PDP11/34. (3 refs.)

112560 A laser system for monitoring photomultiplier tubes in counter arrays. P.Smith (Dept. of Phys., Indiana Univ., Bloomington, IN, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.385-90 (1 Sept. 1983).

The design of two computer-controlled, pulsed laser systems used for monitoring gains and timing stability of photomultipliers in high energy physics experiments is described. Typical data obtained with these systems are presented. (9 refs.)

112561 Automatic scanning of solid state nuclear track detectors at low track density. H.X.Zhang, T.R.Yeh, H.Lancman (Phys. Dept., Brooklyn Coll., City Univ. of New York, New York, NY, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.391-4 (1 Sept. 1983).

A device for scanning large areas of Kimfol fission track detectors is described. It is being used in photofission experiments where $\sim 10^4$ cm² of film per run have to be handled. The tracks are first enlarged by etching and sparking. The film is then scanned by a high resolution Vidicon camera and the x and y coordinates of each track are stored in a computer. A typical scanning speed is 10 cm²/s. The counting efficiency is close to 100%. (10 refs.)

112562 Large volume neutron detectors with subnanosecond time dispersions. R.Madey, J.W.Watson, M.Ahmad, B.D.Anderson, A.R.Baldwin, A.L.Casson, W.Casson, R.A.Cecil, A.Fazely, J.M.Knudson, C.Lebo, W.Pair-suwan, P.J.Pella, J.C.Varga, T.R.Witten (Dept. of Phys., Kent State Univ., Kent, OH, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.401-13 (1 Sept. 1983).

Design criteria and performance characteristics are described for large-volume (13.1 l to 118 l) mean-timed plastic-scintillator detectors for neutrons from ~ 2 MeV to 2 GeV. Detectors were constructed in six sizes (all 0.102 m thick) from 0.126 m \times 1.016 m \times 0.102 m to 0.762 m \times 1.524 m \times 0.102 m. Overall energy resolutions of 230 keV for 80 MeV neutrons, 320 keV for 133 MeV neutrons, and 440 keV for 157 MeV neutrons were achieved in time-of-flight experiments with flight paths of 76, 68, and 91 m, respectively. The detectors have pulse-height responses uniform to $\pm 5\%$ except close to the ends, position resolutions less than 5 cm, and intrinsic time dispersions less than 400 ps. Typical neutron detection efficiencies are 20% for 20 MeV neutrons at a pulse-height threshold of 2 MeV equivalent-electron energy (MeV ee) and 3.5% for 200 MeV neutrons at a pulse-height threshold of 50 MeV ee. (23 refs.)

112563 Instrumental limit and number of effective granules in superheated superconducting detectors. A.Hrisoho (Lab. de l'Accelérateur Lineaire, Univ. Paris Sud, Orsay, France), G.Waysand. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.415-18 (1 Sept. 1983).

A relation has been established between the number of effective granules in a superheated superconducting detector and the noise factor of the electronic channel which is expressed in terms of the magnetic flux involved. Consequences for detector design are discussed. (7 refs.)

112564 A precision beta gauge using a plastic scintillator and photomultiplier detector. J.M.Jaklevic, N.W.Madden, C.E.Wiegand (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.517-18 (1 Sept. 1983).

The authors describe the use of a plastic scintillator photomultiplier detector combination in applications involving the precision beta-gauge measurement of small mass deposits of thin substrates. The requisite precision (± 2 μ g/cm²) places stringent requirements on the beta-particle counter and associated electronics. The scintillator based system is shown to be equivalent if not superior to previously employed semiconductor detectors with respect to long-term counting stability. (3 refs.)

112565 Effect of electric field on cellulose nitrate track detector. S.K.Chakravarti (Dept. of Appl. Phys., Regional Engng. Coll., Kurukshetra, India), K.K.Nagpaul. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.519-24 (1 Sept. 1983).

The influence of DC electric fields ($0.3\text{--}5 \times 10^7$ V.m⁻¹) applied for different durations (0-2 h) on the track recording characteristics of CA80-15 Kodak Pathe' cellulose nitrate is reported. It is observed that at a lower etch time of 30 min (2.5 N NaOH, 55°C, without stirring), etched track diameters of normally incident 4 MeV α -particles remain unchanged almost up to the applied electric fields 0.3×10^7 V.m⁻¹ irrespective of the time duration of application of field. Track diameter increases on increasing the field further. At higher etching times (interrupted etching with 30 min step) track diameter and bulk etch velocity V_g go on decreasing in general at first, attain a minimum and then show an upward trend at fields $\sim 3 \times 10^7$ V.m⁻¹. However, for field values $> 3 \times 10^7$ V.m⁻¹ and longer field times (1.5-2 h), downward trend is indicated. Average bulk etch velocity calculated for a total etch time of 180 min for the samples treated with different electric fields for a maximum time of 2 h, increases first, acquires a maximum and then exhibits a falling trend with increasing fields. Average track etch velocity, V_t , however, decreases initially and then increases with the field followed by an abrupt rise at higher field values. The etch velocity ratio, V_t/V_g , shows peaking at 3.5×10^7 V.m⁻¹ in the upward direction. The etching efficiency, η , changes from 82% to 97% for the field values changing from 1×10^7 V.m⁻¹ to 3.5×10^7 V.m⁻¹ for a field duration of 2 h and total etch time of 180 min. An attempt has been made to correlate the observed results with the possible increased crystallinity with the application of electric field leading to the electret phenomenon involving molecular orientations and the ozone effects. (32 refs.)

112566 Special gas mixtures with very small drift angles at low drift velocities. U.Becker, M.Capell, M.Chen, M.White, C.H.Ye, K.Yee (Lab. for Nuclear Sci., MIT, Cambridge, MA, USA), J.Fehlmann, P.G.Seiler. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.525-30 (1 Sept. 1983).

Using the novel technique of UV laser-induced ionization, drift angles and drift velocities have been measured for various gas mixtures. In the region where the drift velocity is linearly dependent on the drift field and up to 10 kG, the measured values agree well with predictions by computations also described. Two gas mixtures were found which give small drift angles at low drift velocities. This is important for the operation of a time expansion chamber (TEC). (12 refs.)

112567 The absolute efficiency of a 7.6- by 7.6-cm bismuth germanate scintillator for 15-MeV gamma rays. N.R.Roberson, S.A.Wender, D.M.Drake (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.541-2 (1 Sept. 1983).

The absolute efficiency of an uncollimated 7.6- by 7.6-cm cylindrical bismuth germanate detector was measured at a gamma-ray energy of 15.1 MeV. The measured photopeak efficiency is 0.51 ± 0.04 . (4 refs.)

112568 A simple detector for locating radiography and radiotherapy gamma emitting radiation sources. P.H.Burgess (Nat. Radiological Protection Board, Chilton, Didcot, England). *J. Soc. Radiol. Prot. (GB)*, vol.3, no.3, p.21-2 (Autumn 1983).

The author provides a simple design of collimated Geiger-Muller tube detector which is simple to construct and would be useful in the recovery of lost gamma radiation sources. The detector is compatible with the majority of ratemeters in present use. (1 ref.)

112569 Radiography with fast neutrons by a plastic detector. E.Duhmke (Radiologische Univ., Kiel, Germany), L.Greim.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.276-80 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

The image recording of fast neutron radiographs can be achieved sufficiently by means of plastic foils and the track etching technique. The optimal etching conditions for cellulose nitrate foils were studied. A mathematical model for the dependence of the optical density on the area and number of the etch pits is given and compared to measurements. Finally, two examples of radiographic applications may underline the possible importance of this method. (4 refs.)

112570 Plastic detector technique in fast neutron radiography. W.Hunger, R.Scherzer, W.Engel, G.Sermund (Inst. für Reine und Angewandte Kernphys., Univ. of Kiel, Kiel, Germany), U.Roose.

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.281-5 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).

In order to detect fast neutrons, the Kodak CA 80-15 plastic detector can be used either as a screen in neutron radiography or as a neutron dosimeter. Especially for 14.9 MeV neutron dosimetry, the authors describe a helium converter test unit which increases the detection efficiency of cellulose nitrate plastic detectors by a factor of 3. (14 refs.)

112571 The neutron sensitivity of a Geiger-Muller counter between 0.5 and 8 MeV. D.T.L.Jones (Medical Component, Nat. Accelerator Centre, Faure, S Africa), W.R.McMurray.

Health Phys. (GB), vol.45, no.3, p.659-63 (Sept. 1983).

Geiger-Muller counters are often used in mixed-field dosimetry to determine the photon dose fraction. For accurate dose specification, their neutron sensitivities must be known. The pulsed beam time-of-flight method was used to determine the neutron sensitivities of an energy-compensated type ZP1320/PTFE Geiger-Muller counter in the 0.5-8-MeV region. The flux of monoenergetic neutrons from the T(p,n)³He and D(d,n)³He reactions, which were used in these measurements, were determined from time-of-flight spectra with an NE213 scintillation counter of known efficiency. (12 refs.)

112572 Performance of silicon surface barrier detectors (p- and n-type) under identical quenchant, postetch ambients and encapsulation. A.K.Batra (Dept. of Phys., Haryana Agricultural Univ., Kaul, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.383-7 (July 1983).

p- and n-type silicon surface barrier detectors (p-SSBD and n-SSBD) have been fabricated by varying the three significant parameters, viz. quenchant, postetch ambients and encapsulations. Postetch exposures of two days' duration to deionized water for n-type and that to dust-free air for p-type have been found essential for SSBD technology. Quenchant experiments lead to their ranking in decreasing order of superiority as HNO₃, H₂O, HF in n-SSBD and HNO₃, HF, H₂O in p-SSBD. Stain film left as a result of quenching appears to have excess of chemisorbed fluoride group. Encapsulation of edges and free rear surface both in p- and n-SSBD reduces the leakage current. It has been applied prior to ambient exposure in p-SSBD and after this exposure in n-SSBD. Leakage currents of less than 1×10^{-8} A (n-SSBD) and 2×10^{-8} A (p-SSBD) have been obtained for reverse biases up to 100 V. The sample detectors yield energy resolutions of 30 keV FWHM (n-SSBD) and 50 keV FWHM (p-SSBD) for 5.47 MeV α -particles. Results indicate dominant dependence of SSBD technology on chemisorbed water and oxygen coverages at different stages of fabrication. (14 refs.)

112573 Thermal degradation of plastic scintillators. E.A.Andreeshchev, S.F.Kilin, Yu.P.Kushakevich, I.M.Rozman, V.M.Shoniya.

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1348-52 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.35-7 (Nov.-Dec. 1982). [received: Sept. 1983]

The thermal degradation of plastic scintillators (polymers of styrene and 2,4-dimethylstyrene and copolymers of these with polyfunctional monomers) has been examined. There is a reduction in light yield and shortening of the scintillation length when the temperature is raised in air. Molecular excited states are quenched in the surface layer and the luminescence is absorbed. (4 refs.)

112574 Scintillation pulse shape provided by polyvinylxylene plastic scintillators. N.Z.Galunov, O.A.Gunder, I.V.Kopina, Yu.A.Tsirlin.

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1352-5 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.38-40 (Nov.-Dec. 1982). [received: Sept. 1983]

Measurements have been made on the shape, size, and spectrum of the scintillations from plastic detectors based on polyvinylxylene containing 2-phenyl-5-(4-biphenyl)1,3,4-oxadiazole as additive and exposed to the β particles of ⁹⁰Sr+⁹⁰Y; these are in no way inferior in speed to NE111 detectors. A scintillator with a decay time of 0.9 nsec is obtained on increasing the concentration of the additive to 7% by mass. (7 refs.)

112575 Method of determining the thickness of nuclear photoemulsions in autoradiography. V.D.Rusov, M.Yu.Semenov, V.A.Barsuk (Odessa State Univ., Odessa, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1357-9 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.42-4 (Nov.-Dec. 1982). [received: Sept. 1983]

A method is proposed for determining and monitoring the thicknesses of nuclear photoemulsions used in optical and electron-microscopy autoradiography. The method is based on measuring the rate of drawing out the samples from the emulsion melt. (10 refs.)

112576 Use of BPS-75+'Elektronika-1001' scanning-measuring system for analysis of photographs from wide-gap chambers. S.A.Averin, G.V.Veselova, G.V.Navasardyan (Inst. of Space Res., Acad. of Sci., Moscow, USSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.1, p.1368-72 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.52-5 (Nov.-Dec. 1982). [received: Sept. 1983]

A semiautomatic system based on the BPS-75 scanning and measuring projector, operating on line with an Elektronika-1001 minicomputer, has been built for processing data from films taken of wide-gap spark chambers of a γ -ray telescope. The system has been tested in processing data from the calibration of wide-gap spark chambers on the DESY accelerator (Hamburg). The angular resolution of the spark chambers is $\pm 1^\circ$ for 2-GeV positrons and 1.8° for 100-MeV γ -rays. On the basis of measurements made on the BPS-75 projector the extraction of information by other discrete devices has been simulated. (9 refs.)

112577 Alpha-spectrometric ionization chamber with an active area of 2m². S.Saro, M.Pikna (Matematicko-Fyzikálna Fakulta, Univ. Komenského, Bratislava, Czechoslovakia).

Jad. Energ. (Czechoslovakia), vol.29, no.8-9, p.306-8 (Aug.-Sept. 1983). In Slovenian.

A large area gridded cylindrical chamber was developed. Sources up to the area of 2 m² can be measured with an efficiency of 37%. The resolution of the detector system is 85 keV at 5.5 MeV. The background at 5.5 MeV is 10 cph/200 keV, the minimum measurable activity is 1 mBq (24 hour measuring time, 2 sigma statistics) and the minimum measurable specific activity at the source thickness 0.1 mg/cm² is as low as 0.5 mBq/g. The application of this spectrometer to the alpha spectrometry of environmental samples permits the direct measurement of very low alpha activities. (3 refs.)

112578 Test of a superconducting magnetic-monopole detector for spurious events due to sea-level cosmic rays. J.F.Ziegler, C.C.Tsuei, C.C.Chi, C.D.Tesche, P.Chaudhari (IBM-Res., Yorktown, NY, USA), K.W.Jones. *Phys. Rev. D (USA)*, vol.28, no.7, p.1793-5 (1 Oct. 1983).

An experimental superconducting magnetic-monopole detector has been constructed similar to that used by Cabrera (1982). It has been tested for spurious signals by immersing it in a high-radiation environment. No spurious events which could be mistaken for a monopole event occurred. The radiation dose of the experiment was equivalent to 1500X the total neutron dose experienced by the Cabrera experiment due to sea-level cosmic rays during its 151-day lifetime. (10 refs.)

112579 Research on some characteristics and improvements of a 70 cm streamer chamber. (The Second Experimental Div., Inst. of High Energy Phys., Acad. Sinica, Peking, China).

Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.3, p.273-84 (May 1983). In Chinese.

The influence of the various proportions of Ne-He gases and the time delay on the quality of streamer tracks has been studied. The diameter and density of streamers under these mixed-gas conditions have been measured. (13 refs.)

112580 Performance of the parallel multilayer avalanche calorimeter. K.T.McDonald (Princeton Univ., Princeton, NJ, USA), A.H.Walenta, Lu Chang-guo.

Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.3, p.285-93 (May 1983). In Chinese.

This is the first attempt to use the PPAC as a sampling calorimeter. The possible fluctuations in this type of calorimeter and the results of simulating measurements performed on a single gap PPAC and actual measurements for a multilayer PPAC calorimeter are presented. (10 refs.)

112581 A scintillation counter hodoscope and on-line experiments with computer. Wang Man, Li Jin, Li Pei-qin, Chen Xian-neng, Chen Le-jun, Jiang Chuen-hua, Xia Xiao-mi, Lu Wei-da, Que You-ken, Lai Yuan-fen, Lu Chang-guo, Cui Xiang-zong (Inst. of High Energy Phys., Acad. Sinica, Peking, China).

Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.3, p.294-300 (May 1983). In Chinese.

A multi-strip scintillation counter hodoscope and a small on-line system are described. The hodoscope is a 4X4 array of scintillation strip counters, each of which consists of a plastic scintillation strip of type NE104 and a photomultiplier of type GDB-50L. An on-line program to test the hodoscope properties has been compiled. (6 refs.)

112582 Monte Carlo calculation of the efficiencies of the lead glass detectors for high-energy gamma rays. Zhang Gui-shan, Zhang Huan-qiao (Inst. of Atomic Energy, Acad. Sinica, Peking, China).

Phys. Energ. Fortis & Phys. Nucl. (China), vol.7, no.3, p.370-8 (May 1983). In Chinese.

The electromagnetic shower processes occurred in the lead glass detector are simulated by the Monte Carlo method, the light collection effects being taken into account. The primary energy of the gamma ray is from 8 to 300 MeV. The detected efficiency function, the energy resolution curve and photoelectron number distribution (the pulse-height spectra) are presented for the lead glass detector. The calculated results are satisfactory. (18 refs.)

112583 Vavilov-Cerenkov radiation as a source of photoradiation processes in electron tracks. I.G.Kaplan, N.V.Polyanskii (L.Ya. Karpov Physicochem. Sci. Res. Inst., Obninsk, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1041-4 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1110-13 (Dec. 1982). [received: Sept. 1983]

It follows from the classic work of Tamm and Frank (1937) that when an electron travels with a velocity exceeding the phase velocity of light in the medium ($v > c/n$, where n is the index of refraction of the medium) the electromagnetic field of the electron lags behind the electron and excites in the medium radiated light, which has been given the name Vavilov-Cerenkov radiation after its discoverers. Cerenkov radiation has found wide application in high-energy physics. However, since the fraction of the energy going into Cerenkov radiation is very small, it is not, as a rule, taken into consideration in the physics of shielding or in radiation chemistry. None the less, as is shown the number of Cerenkov quanta radiated along the track of the electron is far from small, and can serve as a means of photoradiation conversion. (10 refs.)

112584 Optimierung sphärischer Ionisationskammern für die Neutronen-diagnostik an Tokamakanlagen (Optimisation of spherical ionisation chambers for neutron diagnostics in Tokamaks). F.Hoenen.

Report JUL-1848, Kernforschungsanlage, Jülich, Germany (March 1983), 32 pp. In German.

For the investigation of neutron emission from fusion plasmas, pulse-ion-chambers are favoured because of their high temporal resolution, the availability of results immediately after the discharge and their insensitivity to hard X-rays. However, to measure ion temperatures below 2 keV with the aid of neutron spectroscopy the detectors have to be improved. Difficulties arise from the fact that in pulse-ion-chambers the pulse height is a function of the

position in the chamber where the ion pairs are produced. It will be shown that this induction effect is smaller in spherical ionisation chambers than in cylindrical ones. This means an increase in energy resolution so that neutrons from the $D(D,n)^3\text{He}$ reaction can be analysed with an energy resolution of better than 3 percent in spherical chambers. (14 refs.)

112585 SCAMPI - A FORTRAN program simulating charge and mass particle identification. M.Annunziata, E.Binaghi, M.G.Fontaneto, P.Guazzoni, P.Mantica, P.Michelato, A.Pasquincucci, G.Sechi, A.Simonetto, L.Zetta. Report INFN/BE-83/1, Ist. Naz. Fis. Nucl., Milan, Italy (1 March 1983), 16 pp.

This paper describes a FORTRAN program simulating mass and charge ion discrimination, using a SSD telescope, the time of flight technique and different algorithms for MZ^2 identification. (9 refs.)

112586 Reconstruction of data for an experiment using multi-gap spark chambers with six-camera optics. R.Maybury, H.M.Daley. Report RL-82-085, Rutherford Appleton Lab., Chilton, Oxon., England (June 1983), 31 pp.

A program has been developed to reconstruct spark positions in a pair of multi-gap optical spark chambers viewed by six cameras, which were used by a Rutherford Laboratory experiment. The procedure for correlating camera views to calculate spark positions is described. Calibration of the apparatus, and the application of time- and intensity-dependent corrections are discussed. 29.60 COUNTING CIRCUITS AND NUCLEAR ELECTRONICS

112587 A fast arithmetical unit used with microprogrammable processors. J.Lecoq, J.D.Berst, J.P.Froberger, J.M.Meyer, M.Perrin (Univ. Louis Pasteur, Strasbourg, France).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.329-32 (1 Aug. 1983).

Describes the 24-bit 200 ns combinatorial arithmetical unit for online dimuon mass computing. The arithmetical unit has been developed to boost the microprocessor GESPRO in the calculations performed for the second level trigger of the NA10 experiment at CERN. It performs one of five arithmetic operations in 200 ns, with 24-bit accuracy. (6 refs.)

112588 A channel profile analyser. S.G.Gobbur (Electronics Div., Bhabha Atomic Res. Centre, Bombay, India).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.349-51 (1 Aug. 1983).

It is well understood that due to the wide band noise present in a nuclear analog-to-digital converter, events at the boundaries of adjacent channels are shared. It is a difficult and laborious process to exactly find out the shape of the channels at the boundaries. A simple scheme has been developed for the direct display of channel shape of any type of ADC on a cathode ray oscilloscope display. This has been accomplished by sequentially incrementing the reference voltage of a precision pulse generator by a fraction of a channel and storing ADC data in alternative memory locations of a multichannel pulse height analyser. Alternative channels are needed due to the sharing at the boundaries of channels. In the flat region of the profile alternate memory locations are channels with zero counts and channels with the full scale counts. At the boundaries all memory locations will have counts. The shape of this is a direct display of the channel boundaries. (1 ref.)

112589 A trigger system using wire chamber information. G.Kernel, P.Krizan, M.Mikuz, A.Stanovnik, D.Zavrtanik (J. Stefan Inst., E. Kardelj Univ. of Ljubljana, Ljubljana, Yugoslavia), C.Engster, E.G.Michaelis, A.G.Zephat, J.Harvey, K.O.H.Ziock.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.273-9 (1 Sept. 1983).

A second level trigger system using conventional wire chamber readout and NIM modules is described. The events to be processed by the on-line computer are selected in a time interval of one microsecond on the basis of number of hits in the wire chambers. Some applications and performances of the system are described in detail. (8 refs.)

112590 Self adapting ratemeter. I.D.Vankov, G.S.Ganev, R.M.Ivanov, M.Muller (Inst. of Nuclear Res. & Nuclear Engng., Sofia, Bulgaria).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.395-400 (1 Sept. 1983).

A ratemeter with a self adapting duration of the averaging time interval is proposed. The conditions for choosing optimum values for its basic parameters are analysed and an equipment version with microprocessor control is

described. This ratemeter features improved statistical accuracy and shorter response time. (2 refs.)

112591 Identification of heavy charged particles by using a fast amplifier to obtain E- and t-signals. A.S.Gass, V.N.Dobrikov, O.F.Nemets, P.N.Svetlichnyi, V.A.Stepanenko, A.A.Shvedov (Nuclear Res. Inst., Acad. of Sci., Kiev, Ukrainian SSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.1, p.1355-7 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.41-2 (Nov.-Dec. 1982). [received: Sept. 1983]

An amplifier with summation of the signals at the output is used for the identification of heavy particles by determining the time of flight. The number of summation stages is three, so that the signal/noise is increased 1.6 times. (6 refs.)

112592 Universal coincidence circuit. Yu.A.Novikov. *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.1, p.1386-9 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.69-72 (Nov.-Dec. 1982). [received: Sept. 1983]

A universal coincidence circuit (UCC) is described consisting of four coincidence circuits and memory. It is realized using series K137 integrate circuits. The UCC operates with input signals of positive and negative polarity with an amplitude of 0.5-10.0 V. The resolving time is adjustable (20 nsec minimum). A variant of the use of the UCC is introduced for the simultaneous measurement of gamma spectra with and without coincidence. (7 refs.)

112593 Units and devices enhancing the reliability and simplifying the operation of apparatus for studying double β -decay. Yu.G.Zdesenko, V.N.Kuts, I.A.Mysyk, A.S.Nikolaiko (Inst. of Nuclear Res., Acad. of Sci., Kiev, Ukrainian SSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.5, pt.1, p.1124-8 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.77-80 (Sept.-Oct. 1982). [received: Sept. 1983]

Describes a monitor unit, a digital frequency discriminator for anticoincidence signals, a device for measuring the 'dead' time, a spectrometer stabilization system, and a signaling system, which have been developed to enhance the reliability and stability and to simplify the operation of a low-background apparatus for studying double β -decay. (3 refs.)

112594 A fast one-electron pulse discriminator. K.D.Shelevoi, V.V.Burkov, A.A.Venikov (Inst. of Atmospheric Optics, Acad. of Sci., Ukrainian SSR). *Instrum. & Exp. Tech. (USA)*, vol.25, no.5, pt.1, p.1150-1 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.99-100 (Sept.-Oct. 1982). [received: Sept. 1983]

A description is given of a discriminator for one-electron photomultiplier pulses that consist of a preamplifier with $K_{om} \geq 110$ and a K597SA1 comparator. The discriminator detects single-electron pulses of duration ≥ 3 nsec. (3 refs.)

112595 Fast and low-cost discriminator and shaper. M.Ambrosio, G.C.Barbarino, M.Castellano, F.Cevenini, G.Paternoster, S.Patricelli. *Report INFN/TC-83/8*, Ist. Naz. Fis. Nucl., Naples, Italy (11 April 1983), 4 pp.

A simple and low-cost discriminator has been realized with emitter-coupled logic IC; input threshold and output width can be varied continuously; the maximum repetition rate is 55 MHz and the typical double pulse resolution is 18 nsec. (2 refs.)

29.70 RADIATION MEASUREMENT, DETECTION AND COUNTING

(see also 29.30 Radiation spectrometers and spectroscopy, 29.40 Radiation detectors; for dosimetry, see 87.60M)

112596 A modification to the Penfold-Leiss method of cross-section unfolding. D.J.S.Findlay (Nuclear Phys. Div., AERE, Harwell, England). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.353-8 (1 Aug. 1983).

The standard Penfold-Leiss method of unfolding a photonuclear cross-section from a measured bremsstrahlung yield curve is shown to fail if the cross-section is unfolded in photon energy bins whose width is comparable with the range of any smearing of the bremsstrahlung spectrum near the endpoint. In the case decided in the text the smearing is due to the energy spread of electrons striking the bremsstrahlung radiator. A simple modification to the Penfold-Leiss prescription is described which overcomes this failure. (9 refs.)

112597 Some remarks concerning triple angular correlations. K.S.Krane (Dept. of Phys., Oregon State Univ., Corvallis, OR, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.321-32 (1 Sept. 1983).

The theory and reported experiments involving triple angular correlations are reviewed. The sensitivity of these experiments to nuclear spectroscopic parameters is discussed. (20 refs.)

112598 An extension to the Feynman method of detecting fission neutrons. G.S.Brunson (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.341-8 (1 Sept. 1983).

The Feynman method of analyzing a neutron flux has been widely used to characterize systems in which fission neutrons are present. John T. Caldwell (1980) of the Advanced Nuclear Technology group of the Los Alamos National Laboratory proposes a variation of this technique in which each sample gate is initiated by a neutron count. The author compared the two methods for a few specific cases and find the second method markedly superior. Moreover, it is possible to combine the two methods and obtain information about single chains that is not available when either method is used alone. For example, the combined methods permit us, without knowing the counter efficiency, to estimate the fraction of fission neutrons in an unknown neutron flux. (5 refs.)

112599 Measurement of bremsstrahlung spectra from 25 MeV electrons on Ta as a function of radiator thickness and emission angle. R.P.Lambert, J.W.Jury (Dept. of Phys., Trent Univ., Peterborough, Ontario, Canada), N.K.Sherman. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.349-60 (1 Sept. 1983).

The effects of radiator thickness and angle of emission in the energy spectra of photons produced by 25 MeV electrons were studied. Bremsstrahlung

energy spectra at four different angles relative to a beam of electrons incident on Ta radiators of three different thicknesses were measured by observing time of flight spectra of photoneutrons from a moveable liquid deuterium target. The radiators were 1/8, 1/2 and 1 radiation length thick. Observations were made at 0°, 1.7°, 3.4° and 5.1°. The photon flux at 5.1° was about 10% of the flux in the forward direction, where the maximum flux occurred. The angular distribution of mean intensity of photons is nearly the same for all the radiators, and is a consequence of multiple scattering of the incident electrons combined with the intrinsic angular distribution of bremsstrahlung. (29 refs.)

112600 Calibration of histograms in nuclear structure physics. C.Wooff (Dept. of Phys., Univ. of Liverpool, Liverpool, England). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.419-20 (1 Sept. 1983).

A procedure for the calibration of one dimensional histograms in nuclear structure physics experiments is presented. A cubic polynomial is used for this purpose. Scaling of the input data is used to improve the accuracy of the calibration. (2 refs.)

112601 The analysis of radioactive decay with a small number of counts by the method of maximum likelihood. B.T.Cleveland (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.451-8 (1 Sept. 1983).

A general procedure is presented for the analysis of ultra low-level counting data for which the time of occurrence of each event is measured. The basic formalism is developed, methods of analysis are described, and an example of the application of the technique to simulated data, similar to that obtained in a solar neutrino experiment, is given. (11 refs.)

112602 Physics breakthrough to shape instrumentation of tomorrow. V.Buchstab. *Can. Controls & Instrum. (Canada)*, vol.22, no.4, p.7-8 (July 1983).

Describes a recent experiment which uncovered a link between electromagnetism and radioactivity. It is hoped that this experiment will result in new technologies. It also used measurement techniques which pave the way for future industrial instrumentation. (no refs.)

112603 The development of radioactive gas standards at LMRI. G.Dhilly, R.Rouxel, M.Despres (Lab. de Metrologie des Rayonnements Ionisants, Gif Sur Yvette, France).

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1145-9 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).

The automation of a production line and of a measuring device for radioactive gas standards is described. These standards are supplied in metal containers of 7-dm³ volume in water at a 100-bar pressure with specific NTP (0°C and 1 atm.) activities ranging from 5.10⁻⁵ to 5.10⁻³ μ Ci.cm⁻³. (1 ref.)

112604 Electrostatic analyzer with variable field geometry. M.M.Dubrov, V.A.Belyaev. *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.1, p.1337-40 (Nov.-Dec. 1982).

Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.25-7 (Nov.-Dec. 1982). [received: Sept. 1983]

An energy analyzer (axisymmetric capacitor) is described, tunable from cylindrical to spatial focusing by changing the distribution of the potentials on its electrodes. The electrodes that bound the analyzer chamber admit the working-region dimensions not less than half the width and height of the interelectrode space at only six different electrode potentials. (3 refs.)

112605 Two-stage integrator for an X-ray tomograph. E.A.Andreev, S.A.Pshenichnyi, S.P.Sit'ko, M.I.Skopyuk, V.A.Shevchekno (Kiev State Univ., Kiev, Ukrainian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.6, pt.1, p.1412-14 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.98-91 (Nov.-Dec. 1982). [received: Sept. 1983]

The instrument described is designed to measure the average current which arises in the sensitive layer of a semiconductor detector under the action of X-rays and is intended for use in scanning X-ray tomographs. In the range 10⁻⁸-10⁻⁶ A the integral and differential nonlinearity were 0.05 and 0.25%, respectively. At a noise current of 3 \times 10⁻¹¹ A the accuracy of measurement reaches 0.1%. (4 refs.)

112606 Stopping power for heavy ions in low energy region. M.Kitagawa (Dept. of Electron., North Shore Coll., Arsugi, Japan).

Oyo Buturi (Japan), vol.52, no.4, p.282-9 (April 1983). In Japanese.

Increase in analysis accuracy of light-ion stopping-power data, the need for establishing definite heavy-ion stopping-power data in the development and research of nuclear fusion, and the advance in heavy-ion accelerator experiments have resulted in progress in the study of the stopping power of heavy ions passing through a substance. The systematic tabulation and theoretical analysis of effective charges, which are inseparably related to heavy-ion stopping powers, have allowed stopping-power data to be analyzed within an error from ± 10 to $\pm 20\%$. The author describes the scaling law between heavy-ion stopping powers and effective charges, and reviews typical methods for analyzing heavy-ion stopping powers. (53 refs.) K.B.

112607 Radon daughter carousel: an automated instrument for measuring indoor concentrations of ²¹⁸Po, ²¹⁴Pb, and ²¹⁴Bi. W.W.Nazaroff (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1227-33 (Sept. 1983).

A microprocessor-controlled instrument for measuring the concentrations of radon progeny in indoor air is described. The measurement technique is based on alpha spectroscopy and uses two counting intervals following a sampling period during which radon progeny are collected on a filter. The counting intervals are selected to provide optimal precision for measuring ²²²Rn progeny for fixed total measurement times ranging from 30 to 60 min: concentrations as low as 0.5 pCi/l can be measured with less than 20% uncertainty in 45 min. The instrument can also be used to estimate the potential alpha energy concentration of ²²²Rn decay products. The device operates under the control of a computer or a data terminal and functions for week-long periods between filter changes. The user can specify the sampling- and counting-interval timing over a wide range and select from among several operating modes. A number of performance tests are also described indicating that for typical indoor concentrations the measurement uncertainty is dominated by counting statistics. (20 refs.)

112608 Results of a quality assurance exercise for radon and radon decay product measurements. J.C.H.Miles, E.J.Stares, K.D.Cliff, J.Sinnaeve. *Report EUR 8629 EN*, Comm. European Communities, Luxembourg (1983), vi+55 pp.

Intercomparisons of both passive and active techniques of measuring radon and radon decay products have been carried out. Ten centres using fourteen types of dosimeters participated in the intercomparison of passive dosimeters, and eleven centres using eighteen sets of equipment participated in the intercomparison of active measurement techniques. Most of the exposures were carried out in a 43 m³ steel room at NRPB Chilton. (10 refs.)

29.80 NUCLEAR INFORMATION PROCESSING

- 112609 INS real-time data processing composite system using large scale general purpose computers. J.Kokame, M.Takano, T.Oshikubo, K.Chiba, K.Ukai, A.Imanishi, M.Yasue, K.Omata, S.-I.Watanabe (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), H.Hirai, M.Ogawa, N.Ishida, K.Kamakura, M.Fujita, K.Koba. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.317-27 (1 Aug. 1983). Quick response real-time facilities, with an overhead time of 18.3 ms, using a general purpose large scale computer, FACOM M-1801AD (2.5 MIPS), and channel coupled terminal minicomputers, PANAFACOM U-400, have been developed and are in operation at INS Tokyo. The system is useful for computer aided real-time data acquisition and for processing experimental nuclear and elementary particle physics data. Another batch processing system for the same type of large scale computer is connected with a real-time machine. Sophisticated analysis of experimental data as well as pure theoretical problems and design studies can be performed by this system. The system is also capable of backing up minicomputer terminals through a modem for the computer control of accelerators and beam diagnostics. (8 refs.)
- 112610 Comments on 'neutron spectral unfolding using the Monte Carlo method'. D.A.Chambless (Dept. of Maths., Auburn Univ., Montgomery, AL, USA), J.A.Broadway. *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.543-5 (1 Sept. 1983). In this note a number of flaws in the article Neutron Spectral Unfolding Using the Monte Carlo Method are identified and discussed. The questions raised by the development of the proposed methodology are shown to be too fundamental to allow serious use of the technique presented. (3 refs.)
- 112611 Reply to Chambless and Broadway. K.O'Brien, R.Sanna (Environmental Measurements Lab., US DOE, New York, NY, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.2-3, p.547-9 (1 Sept. 1983). The authors reply to Chambless and Broadway's comments on their previous paper (1981) on neutron spectral unfolding using Monte Carlo methods. They discuss the nonuniqueness of the deconvolution, the positivity of trial solutions and the underdeterminedness of the system. (5 refs.)
- 112612 Early experience with the programming language P+. R.Cailliau, B.Carpenter, I.Killner (CERN, Geneva, Switzerland). Proceedings of the International Computing Symposium 1983 on Application Systems Development, Nurnberg, Germany, 22-24 March 1983 (Stuttgart, Germany: B.G. Teubner 1983), p.286-300. Until the introduction of the high-level language P+ in September 1981, application programs for a large process control system at CERN were developed using classical methods and the high level languages Nodal, Pascal and machine language. The authors discuss how the changeover to P+ has fared so far, and compares actual experience with current academic and industrial trends. It tends to show that simplicity and orthogonality of design are incompatible with the needs of programmers in large projects. It is shown how P+ tries to resolve this dilemma by being able to adapt to project requirements while at the same time remaining a general purpose language. (15 refs.)
- 112613 Computers and data processing in high energy physics. R.K.Bock (CERN, Geneva, Switzerland). Proceedings of the International Computing Symposium 1983 on Application Systems Development, Nurnberg, Germany, 22-24 March 1983 (Stuttgart, Germany: B.G. Teubner 1983), p.506-28. Computer applications in high energy physics are described. The author shows that this area of physics offers some challenge to software technology.

Advances are needed in techniques and tools enhancing, adaptability to ending problems, exchange of code and data between different computers, and module definition at specifications and implementation levels. (10 refs.)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

- 112614 Localizability of dynamic electron correlation. P.Pulay (Dept. of Chem., Univ. of Arkansas, Fayetteville, AZ, USA). *Chem. Phys. Lett. (Netherlands)*, vol.100, no.2, p.151-4 (2 Sept. 1983). The convergence of the intrapair correlation energy for a localized internal orbital is investigated as the virtual subspace is enlarged. At variance with previous investigations of this kind, the virtual subspace is presented in atomic orbitals. This allows to define spatial relations between the orbitals involved. Typically, over 98% of the pair correlation energy is recovered by a small local basis set, consisting of the valence orbitals of the atoms with which the electron pair is associated. This opens the possibility of an efficient CI procedure based on localized pairs. (13 refs.)
- 112615 Density functional calculations for atoms in the first transition series. J.G.Harrison (Dept. of Phys., North Dakota State Univ., Fargo, ND, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2265-9 (1 Sept. 1983). s-d interconfigurational energies and spin-flip energies for atoms in the first transition series are examined in the self-interaction-correlated local spin density approximation (SIC-LSDA). The results are substantially improved over previous LSDA calculations and SIC-LSDA calculations employing spherical-orbital densities. The implications for accurate cohesive energy calculations and molecular bonding in iron-series dimers are discussed. (35 refs.)
- 112616 Some remarks on the density functional theory of few-electron systems. R.G.Parr, L.J.Bartolotti (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2810-15 (21 July 1983). The density functional theory for the ground state of an electronic system is re-formulated by replacing the electron density ρ by the product of the number of electrons N and a shape factor σ , and several features of the theory are elaborated in this formulation. Clarification is thereby provided for a number of subtle points in the theory for a finite number of electrons, especially aspects of the chemical potential μ . Among the questions considered are definition of the energy curve $E(N)$ and possible discontinuities in its slope μ , ambiguities in various functional derivatives and long-range behavior of them, and similar questions in Kohn-Sham theory. It is shown that without knowledge of an appropriate general functional $E[\rho]$, including its dependence on N , it is impossible to determine its chemical potential, from either the actual electron density of a system or a calculation of any kind on that system holding N constant. Nevertheless the chemical potential is well defined and physically meaningful for any specific system of interest. (20 refs.)
- 112617 Period doubling in the $n+1$ filling rule and dynamical symmetry of the Demkov-Ostrovsky atomic model. Y.Kitagawara, A.O.Barut (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA). *J. Phys. B (GB)*, vol.16, no.18, p.3305-27 (28 Sept. 1983). The invariance properties of the Demkov-Ostrovsky (DO) equation are analysed. This equation models the $n+1$ filling rule of the atomic Aufbau principle. Contrary to a claim by Ostrovsky and contrary to generally known quantum problems, the degeneracy structure of the quantum number $n+1$ in this model is not associated with the representation of a finite-dimensional Lie algebra. It is found, however, that the degeneracy algebra does not close under the usual commutation relations, but under a generalised set of commutation rules. The properties of the new algebra are closely examined. It is shown that the characteristic 'period doubling' in the DO model follows from the structure of this algebra. It is also shown that the two-dimensional analogue of the DO equation admits an $SO(3,2)$ dynamical group which, however, allows more states than the physically required ones. Nevertheless, by a redefinition of the quantum labellings, one obtains a mapping to the appropriate state diagram corresponding to the Aufbau chart. (24 refs.)
- 112618 Historical survey and recent progress in the theory of non-rigid molecules. J.Serre (Lab. de Chimie, ENSJF, Montrouge, France). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.1-12. After experimental considerations on the notion of non-rigid molecules, the main ideas of the applications of group theory in this field are given: semi-direct product, induced representations and wreath products. The structure of the groups in this last case is outlined and the generating of the character

tables is explained from precise examples. Different applications of non-rigid molecule theory to several kinds of spectroscopy are illustrated. (39 refs.)

112619 Classical molecular structure and the puzzle of 'classical limit' in quantum theory. P.Claverie (Lab. de Chimie Quantique, Inst. de Biologie Phys.-Chimique, Paris, France). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.13-22
The classical concept of molecular structure plays a fundamental role in Chemical Physics. This concept appeared long before the advent of Quantum Theory, and, contrary to widespread views, these two conceptual frames (Classical Molecular Structure and Quantum Theory) cannot be easily reconciled. The author argues that the problem of the relationship between these two conceptual frameworks may be embedded in the wider problem of the 'classical limit' of Quantum Theory. He further argues that this latter problem has not yet received a genuinely satisfactory solution, by considering three examples: the behaviour of wave-packets in free translational and free rotational motion, and the non-positive character of the Wigner distribution function. The non-classical results obtained in these examples show, in the author's opinion, that the general problem of the classical limit, and more specifically the problem of the classical molecular structure, must be considered as essentially unsolved at the present time. (37 refs.)

112620 A molecular vision of the world. R.Daudel (Sorbonne & Centre de Mecanique Ondulatoire Appl., CNRS, Paris, France). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.23-8
After having recalled the methods which give the most concrete images of the electronic organization of molecules, the author delineates the numerous applications of the concept of molecule in neurology, pathology, pharmacology, biology and social science. He concludes by mentioning the existence of a molecular art. (6 refs.)

112621 Moving and fixed reference frames for symmetry operations. Ph.R.Bunker, B.J.Howard (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.29-37
The approaches used in the books of Bunker and Wigner to generate matrix representations of groups are different, as can be seen by comparing Eq. (5-49) of Bunker's with Eq. (11.23) of Wigner's. The matrices generated in the one approach are the transpose of those generated in the other approach. The two approaches are compared by using the rotation group D_2 and the permutation group S_3 . For rotation groups the approach to be used depends on whether one is concerned with rotations about space fixed or molecular fixed axis systems. (2 refs.)

112622 Classification of mobile molecules by category theory. A.Dress (Fakultät für Math., Univ. Bielefeld, Bielefeld, Germany), A.Dreiding, H.Haegi. Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.39-58
Some geometric problems relating to the description of the spatial structures of mobile (non-rigid) molecules and the definition of their symmetry group are being discussed. (23 refs.)

112623 From mobile molecules to their symmetry groups: a computer-implemented method. P.Floersheim, K.Wirth, M.K.Huber, D.Pazis, F.Siegerist, H.R.Haegi, A.S.Dreiding (Organisch-Chem. Inst., Univ. Zurich, Zurich, Switzerland). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.59-80
The authors present a symmetry perception method, applicable to mobile (non-rigid, quasi-rigid or rigid) molecular structures. It is based on symmetry consistent descriptions in the form of finite relational systems. The automorphisms and enantiomorphisms associated with such a relational system constitute the H-group which the authors take to be the symmetry group of the molecule. The M-group is obtained by a canonization algorithm applied to the relational system. The symmetry perception method has been implemented as a computer program, called ONOMA. ONOMA guides the user interactively to an adequate description of a given molecule, canonizes this description and computes the M-group in form of permutations of atom labels. This group correctly characterizes the chemically relevant equivalences of atoms or parts of the described molecule. (8 refs.)

112624 The semi-direct product structure of nonrigid molecule groups. G.S.Ezra (Chem. Dept., Univ. of Chicago, Chicago, IL, USA). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.81-93
The properties of the semi-rigid molecular model and the definition of its symmetry group are reviewed. The semi-direct product structure of the symmetry group of the molecular model is considered. Previous treatments are discussed, and several examples of semi-direct product factorization given. Construction of the group character table is facilitated through use of induced representation theory. The associated nomenclature for irreducible representations is useful in obtaining rigid/nonrigid correlation diagrams. The author concludes with some remarks on selection rules and nuclear vibrations in nonrigid molecules. (24 refs.)

112625 The use of induced representations in nonrigid molecules. S.L.Altmann (Dept. of Metall. & Sci. of Materials, Univ. of Oxford, Oxford, England). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.95-112
Concerned with molecules for which a semidirect product form obtains, in which case the methods of induced representation theory can readily be used. The main purpose of this work is to stress that the use of such methods must not be thought of as merely providing a convenient short cut. On the contrary, these methods provide a valuable and intuitive insight into the nature of the energy levels of the molecules. A brief review of induced representation theory, as supplied to these molecules, is given and an example is treated. Formal similarity with the Bouckaert, Smoluchowski and Wigner method in solids, which revolutionized the understanding of space-group representations, is pointed out. (25 refs.)

112626 Classification of nonrigid-molecule energy levels. B.J.Dalton (Phys. Dept., Univ. of Queensland, St. Lucia, Queensland, Australia). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.169-200
The effective symmetry group used in classifying the energy levels, specifying the selection rules and calculating statistical weights is determined for nonrigid molecules where nonrigid effects are a small deviation from rigid molecule behaviour. The situation in which nuclear spin dependent (hyperfine) interactions are important is examined, and it is found that although the previous effective symmetry group species are no longer exact symmetry labels, they would still be useful in the case where hyperfine effects are not too large, leading to weak selection rules enabling predictions of which hyperfine spectral lines are weak or strong to be made. Illustrative applications of the theory are given throughout. (19 refs.)

112627 Symmetry analysis and conformational dependence of molecular properties in non-rigid systems. J.Marunani, A.Toro Labbe (CMOLA, CNRS, Paris, France). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.291-314
In non-rigid molecules or molecular aggregates, the dependence of any property on the conformation of the system can be expressed in the form of a limited expansion in terms of appropriate harmonics. Use of the symmetry properties of the molecular groups to reduce such an expansion affords a double advantage: i) it helps reduce, sometimes drastically, the time required to compute the conformational dependence of the investigated property; ii) it provides a parameterized functional form which can be used by experimentalists to rationalize their results. The selection rules which define the non-zero harmonics are determined by a set of symmetry indices which depend on both the form of the property (scalar, vectorial, or tensorial; aggregate, mononuclear, or binuclear) and the nature of the isodynamic operations which characterize the system. (29 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

112628 Semiempirical studies of core electron binding energies. X. The SCC-MO calculations on some purines. Z.B.Maksic, K.Rupnik (Theoretical Chem. Group, 'Rudjer Boskovic' Inst., Zagreb, Yugoslavia), A.Veseli. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.866-73 (Aug. 1983).
The solid state binding energies of 8-azaguanine, 8-azaxanthine, hypoxanthine and xanthine were calculated by using semiempirical self-consistent charge intramolecular electrostatic potentials expressed in the point-charge approximation. The results are essentially in good agreement with the experimental data giving in the same time a very simple and transparent interpretation of ESCA spectra which is close to the chemical intuition. Splitting of some unresolved N(1s) peaks is proposed to separate binding energies are attributed to particular nitrogen atoms. Since the point-charge model describes a number of molecular properties, it is concluded that formal atomic charges are meaningful within the adopted theoretical framework despite the fact that they can not be defined in a unique fashion. The relaxation energy and work functions of the studied molecular crystals are briefly discussed. (26 refs.)

112629 Ab initio studies of hydrogen bond formation in methyl cyanide or methyl isocyanide and methanol systems. T.-H.Tang (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada), X.-Y.Fu. *Int. J. Quantum Chem. (USA)*, vol.24, no.3, p.317-25 (Sept. 1983).
 $\text{CH}_3\text{CN} \cdots \text{HOCH}_3$ and $\text{CH}_3\text{NC} \cdots \text{HOCH}_3$ hydrogen-bonded systems have been studied theoretically by ab initio MO methods using a 4-31G basis set at their equilibrium geometries. The stabilization energies of these hydrogen bonds are 5.4 and 5.9 kcal/mol, respectively. The nature of these hydrogen bonds is discussed in the light of frontier orbital theory and the topological properties of the charge density of the chemical bond. (17 refs.)

112630 The properties of ferrocenyl-stabilised carbocations. W.E.Watts (Dept. of Chem. New Univ. of Ulster, Coleraine, N Ireland). *Indian J. Phys. Part B*, vol.57B, no.3, p.1-3 (June 1983).
Ferrocene (dicyclopentadienyl) is a stable covalent molecule which possess a 'Sandwich' structure. In the crystal, the C_5H_5 rings are staggered (antiprismatic structure) but in the vapour phase they are eclipsed (prismatic structure). The barrier to ring rotation is very low (ca. 0.9 Kcal mol⁻¹). The electronic structure of ferrocene has been calculated by the MO method. (no refs.)

112631 A new formulation of scaled atoms-in-molecules theory. F.O.Ellison (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2278-83 (1 Sept. 1983).
In scaled atoms-in-molecules theory, variational scaling parameters are introduced into the A- and B-atom eigenfunctions from which molecular basis functions are constructed. All intraatomic contributions to matrix elements are determined rigorously in terms of scaling parameters and experimental atomic state energies. Approximate atomic state eigenfunctions are used to compute interatomic contributions. Ground and excited state energy roots of the resulting molecular eigenvalue problem can be independently minimized with respect to the scaling parameters. The original formulation of theory (SAIM.V) employed atomic potential energy operators as part of the intraatomic correction due to scaling. A new formulation (SAIM.T) using atomic kinetic energy operators in this role is tested in calculations on H_2 , HeH^+ , He_2^+ , and HeH . The simpler SAIM.T formulation is found to give results of the same quality as the original SAIM.V version. (9 refs.)

- 112632 Basis set effects in Hartree-Fock studies on aromatic molecules: Hartree-Fock calculations of properties in benzene and hexafluorobenzene.** J. Almlöf, K. Faegri, Jr. (Dept. of Chem., Univ. of Oslo, Oslo, Norway). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2284-94 (1 Sept. 1983). A number of selected properties have been evaluated for the benzene and hexafluorobenzene molecules, using more than 20 different Gaussian basis sets. The effects of polarization functions have been studied and scaling of the orbital exponents in energy-optimized basis sets is commented on. The effects of extending the primitive basis sets are also discussed and the particular problems associated with LCAO studies on polar molecules are investigated. (33 refs.)
- 112633 The use of modified virtual orbitals in perturbative polarization propagator calculations.** J. Oddershede, J.R. Sabin (Dept. of Chem., Odense Univ., Odense, Denmark). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2295-301 (1 Sept. 1983). The use of modified virtual orbital potentials in perturbative polarization propagator approaches has been investigated. The authors find that the random-phase approximation (RPA), which is identical to a first order polarization propagator approach, is invariant to modifications in the virtual orbital potential, provided that the authors include all possible excitations within a given basis set. Even in a moderately truncated excitation space the authors find only a small change in RPA. However, the second order polarization propagator approximation is not invariant to unitary transformations of the virtual orbitals. Certain dominator shifts in the correlation coefficients and in the two-particle, two-hole terms will reduce this dependence on the virtual orbital potential. Numerical applications to Be and CO show that the authors may have simple V^{N-1} potentials which do not give a convergent scheme. This happens when the virtual orbital energies are too close to the orbital energies of the occupied orbitals. (35 refs.)
- 112634 Perturbation theory of the electron correlation effects for atomic and molecular properties. VII. Complete fourth-order MBPT study of the dipole moment and dipole polarizability of H_2O .** G.H.F. Diercksen, V. Kello (Max-Planck-Institut für Physik und Astrophys., Garching bei München, Germany), A.J. Sadlej. *J. Chem. Phys. (USA)*, vol.79, no.6, p.2918-23 (15 Sept. 1983). The dipole moment and dipole polarizability tensor of the water molecule are calculated by using a complete fourth-order many-body perturbation theory (MBPT) approach based on the coupled Hartree-Fock (CHF) solution for the one-electron perturbation problem. The CHF-based MBPT calculations reveal that the fourth-order correlation corrections involving triple and single substitutions in the reference HF determinant are by no means negligible. On the contrary they represent the two largest in magnitude fourth-order terms. The present study reveals that good results obtained with several approximate fourth-order MBPT schemes follow from some mutual cancellations between the neglected lower and higher-order contributions. Among these approximate MBPT approaches particular attention is given to the CHF-based treatment which involves only singly and doubly substituted states (SD-MBPT) and which provides a reasonable agreement with both the experimental data and more accurate theoretical values. (39 refs.)
- 112635 A theoretical study of the properties of BH_3NH_3 .** J.S. Binkley, L.R. Thorne (Sandia Nat. Labs., Livermore, CA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2932-40 (15 Sept. 1983). Borane monoammoniate (BH_3NH_3) has been studied using several ab initio electronic structure methods and Gaussian basis sets. Equilibrium geometries have been computed at the Hartree-Fock level and, using the electron-correlated Moller-Plesset perturbation method, carried out to third order (MP3) with double-zeta polarized quality basis sets. The computed MP3 geometry is in close agreement with recent microwave data; electron correlation is found to be necessary for a proper description of the B-N distance. Hartree-Fock dipole moments and harmonic vibrational frequencies are presented and discussed. Moller-Plesset perturbation theory carried out to fourth order with triple-zeta plus polarization basis sets is used to compute a B-N dissociation energy of $34.7 \text{ kcal mol}^{-1}$ and a (Hartree-Fock zero-point corrected) rotational barrier of $2.065 \text{ kcal mol}^{-1}$, which is in excellent agreement with the experimental value. Analysis of the dissociation energy as a function of perturbation order indicates that terms involving triple and quadruple substitutions are required in the dissociation energy. (46 refs.)
- 112636 Use of dimer potentials to calculate the energy levels of alkali atoms in rare-gas matrices.** L.C. Balling, J.J. Wright (Dept. of Phys., Univ. of New Hampshire, Durham, NH, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2941-4 (15 Sept. 1983). A simple procedure is described for calculating the energy levels of an alkali atom perturbed by rare-gas neighbors in a solid rare-gas matrix, using alkali-rare-gas dimer potentials available in the literature. Straightforward analysis leads to an expression for the perturbation due to an arbitrary number of rare-gas neighbors in terms of alkali-rare-gas dimer potentials. The results of calculations for Na trapped in Ar are presented and compared with experiment and with earlier pseudopotential calculations. (11 refs.)
- 112637 Hartree-Fock and Hartree-Fock-Slater electric field gradients (H_2 , CH_4) and their symmetry mode derivatives (CH_4).** J.G. Snijders, W. van der Meer, E.J. Baerends, C.A. de Lange (Scheikundig Lab., Vrije Univ., Amsterdam, Netherlands). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2970-4 (15 Sept. 1983). Electric field gradients in the molecules H_2 and CH_4 are calculated by the Hartree-Fock and Hartree-Fock-Slater methods. In CH_4 , the derivatives of the electric field gradient with respect to the vibrational symmetry modes are determined. It is shown that one C-H stretch symmetry mode derivative is completely dominant. This derivative has recently been used to explain the quadrupole splittings found in the NMR spectra of the deuterated methanes dissolved in liquid crystals. (15 refs.)
- 112638 Theoretical studies of van der Waals molecules: general formulation.** G. Danby (Phys. Dept., Univ. of Durham, Durham, England). *J. Phys. B (GB)*, vol.16, no.18, p.3393-410 (28 Sept. 1983). The problem of calculating the bound-state energies of a molecular dimer, consisting of any two diatomics, treated as rigid rotors, is formulated. Full use is made of relevant symmetry properties. The R -matrix propagator and de Vogelaere methods are used to integrate the resulting coupled equations, and their convergence properties are compared. Results obtained for the Ar-HCl dimer are found to be in excellent agreement with previous calculations. (31 refs.)
- 112639 Theoretical studies of van der Waals molecules: the H_2-H_2 dimer.** G. Danby, D.R. Flower (Phys. Dept., Univ. of Durham, Durham, England). *J. Phys. B (GB)*, vol.16, no.18, p.3411-22 (28 Sept. 1983). The authors report calculations of the energy level structure of the H_2-H_2 dimer in which the coupled equations have been numerically integrated. The R -matrix propagator and de Vogelaere algorithms have been used, and their respective convergence properties are briefly discussed. The convergence of the eigenvalues with respect to the size of the rotational basis set is also illustrated. Satisfactory numerical agreement is found with calculations based

upon the secular equation method. Three independent ab initio potentials are studied. The recent CI potential of Meyer and Schaefer (1983) and Schaefer and Liu (1983) is found to give the best agreement with spectroscopic measurements, although a small shift of the position of the isotropic potential minimum is indicated. (18 refs.)

- 112640 Ab initio investigation of intramolecular rearrangements and nature of barriers in SH_6 and SF_6 molecules.** A.I. Boldyrev, V.G. Zakhevskii, O.P. Charkin (Inst. of Chem. Problems, Acad. of Sci., USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.844-7 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.30-4 (Nov.-Dec. 1982). [received: Sept. 1983] Within the framework of the ab initio Hartree-Fock-Roothaan method with a double-zeta Huzinaga-Dunning basis, calculations have been performed with complete optimization of the geometry of the basic octahedral configuration and the trigonal prism configuration corresponding to the apex of the barrier in the path of intramolecular rearrangement of SH_6 and SF_6 molecules. The barriers for the SH_6 and SF_6 are 68.6 and 61.7 kcal/mole, and the intramolecular rearrangements of both molecules are forbidden. The nature of the barrier has been analyzed in the language of correlation diagrams and populations according to Mulliken. The barrier in SH_6 and SF_6 is due mainly to nonbonding ligand-ligand interactions, whereas the central atom-ligand bonding interactions exhibit smaller changes. (10 refs.)

- 112641 Structure of protonated forms of coumarin and its hydroxy derivatives.** I.V. Sokolova, L.I. Loboda (Siberian Phys. Engng. Inst., V.D. Kuznetsov Tomsk State Univ., Tomsk, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.848-54 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.35-41 (Nov.-Dec. 1982). [received: Sept. 1983] The molecular electrostatic potential method, together with experimental investigations of the main properties, was applied to the study of the proton acceptor capacity of coumarin, 7-OH-coumarin, and 7-OH-4CH₃-coumarin in various excited states. The influence of protonation of coumarins on their special properties is examined. A zone of negative potential with minimum around the C=O group in the plane of the molecule, common to the pyrone and carbonyl oxygens, was obtained for the coumarins studied. It was shown that forms protonated on the carbonyl and pyrone oxygens will have a flat structure, while those protonated on the substituents studied will have a non-planar structure. It was found that excitation to the $S_{n\pi^*}$ state increases the proton acceptor capacity of hydroxycoumarins, while excitation to $S_{n\pi^*}$ sharply decreases it. (17 refs.)

- 112642 Nonempirical calculations of molecular characteristics.** A.I. Dement'ev (All-Union Sci.-Res. Center for the Study of Surface & Vacuum Properties, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.947-55 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.148-57 (Nov.-Dec. 1982). [received: Sept. 1983] A review is given of current directions for investigations in the fields of optimization of basis sets, the SCF method, configuration interaction, the multiconfiguration SCF method. Examples are given for calculations of molecular characteristics. (62 refs.)

- 112643 Improved bond-orbital calculations of rotation barriers in molecules containing lone pairs of electrons.** G.F. Musso, G. Figari, V. Magnasco (Istituto di Chimica Industriale, Genova Univ., Genova, Italy). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, no.8, p.1283-98 (Aug. 1983). Improved bond-orbital calculations at the ab initio level using a STO-3G basis and assuming rigid rotation and experimental geometries have been performed for the eclipsed and staggered forms of CH_3NH_2 and CH_3OH , for 11 conformations of N_2H_4 and 12 of NH_2OH . The one-configuration wavefunction of strictly localized nonorthogonal bond-orbitals is improved in second-order perturbation theory by admitting CI with nonorthogonal configurations arising from single excitations to antibonding orbitals. The results obtained using bond orbitals variationally optimized with respect to hybridization and polarity parameters show that in the cases of lower local symmetry (N_2H_4 and NH_2OH) second-order delocalization is essential for a correct description of the dependence of molecular energy on the dihedral angle. All conformational parameters obtained in second order are in good agreement with the corresponding MO-SCF quantities in the same basis. (54 refs.)

- 112644 Energetics and structure of the hydrated gaseous halide anions.** B.T. Gowda, S.W. Benson (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA). *J. Comput. Chem. (USA)*, vol.4, no.3, p.283-93 (Fall 1983). Energetics and geometries for the hydrated gaseous halide anions have been computed from a simple model in which the molecular dipole of water was composed of two parts, one due to a lone pair on oxygen (60%) and the rest to formal charges on the nuclei. The calculations were made for both symmetric and nonsymmetric structures. A variety of structures were used to compute potential energies and distances with up to six water molecules. The total energy consisted of a sum of electrostatic, polarization, dispersion, and repulsion terms. Various sets of repulsive potential parameters, ranging from those determined from molecular beam experiments to those determined using experimental ion-water distances or energies, have been employed to compute repulsive interaction energies. The range parameters play a significant role in deciding the magnitudes of the distances and energies, as the latter are most sensitive to them. It was also shown that with a simple correlation scheme the consistency of the experimental energies and distances can be tested separately without using repulsive potential parameters from other sources. It also suggests that a range of parameters can be used to compute repulsion energies. (44 refs.)

- 112645 Efficient diffuse function-augmented basis sets for anion calculations. III. The 3-21+G basis set for first-row elements.** Li-F. T. Clark, J. Chandrasekhar, G.W. Spitznagel, P. von Rague Schleyer (Inst. für Organische Chem., Friedrich-Alexander-Universität Erlangen-Nürnberg, Erlangen, Germany). *J. Comput. Chem. (USA)*, vol.4, no.3, p.294-301 (Fall 1983). For pt. II see *ibid.*, vol.3, p.363 (1982). The relatively small diffuse function-augmented basis set, 3-21+G, is shown to describe anion geometries and proton affinities adequately. The diffuse sp orbital exponents are recommended for general use to augment larger basis sets. (25 refs.)

- 112646 Computer generation of the symmetry elements of nonrigid molecules.** K. Balasubramanian (Dept. of Chem., Univ. of California, Berkeley, CA, USA). *J. Comput. Chem. (USA)*, vol.4, no.3, p.302-7 (Fall 1983). Algorithms and computer programs are developed for generating the symmetry elements of nonrigid molecules. These programs are based on the wreath product formalism for the symmetry groups of nonrigid molecules developed by the author. Several examples are given to illustrate the procedures. Applications to weakly bound van der Waal complexes synthesized by supersonic beam expansion are also presented. (29 refs.)

112647 Molecular mechanics with an array processor. P.H.Berens, K.R.Wilson (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA).

J. Comput. Chem. (USA), vol.4, no.3, p.313-32 (Fall 1983).

Computer simulation of the mechanics of molecular systems is a popular and powerful method for understanding chemical processes. The complexity of modeled chemical systems have advanced from hard spheres and rare gases to liquid solutions and biomolecules. Such simulations are computationally intensive and thus are limited by the speed of available computers. The article describes the use of specialized hardware, a high-speed floating-point array processor (AP), to dramatically speed up molecular mechanics, in other words molecular dynamics, Monte Carlo, and energy-minimization calculations. Since the architecture of the machine is dramatically different from conventional computers and utilizing its fast speed necessitates using this architecture on the assembly language level, the proper design and implementation of algorithms is critical. The molecular mechanics software design, consisting of 12000 lines of C and 7000 lines of AP assembly language code, is quite general and has been used to study systems ranging from rare gases to biomolecules. This implementation yields effective speeds approximately 35 times faster than a dedicated DEC VAX 11/780 computer with floating-point accelerator and optimized VMS FORTRAN, thus allowing simulations to be run in one and a half weeks on the AP which would require a year of dedicated VAX time. (66 refs.)

112648 Intramolecular interaction effects and the structure of N_2O_5 and N_2O_3 : an ab initio study. C.Bock, M.Trachtman (Chem. Dept., Philadelphia Coll. of Textiles & Sci., Philadelphia, PA, USA), A.Schmiedekamp, P.George, T.S.Chin.

J. Comput. Chem. (USA), vol.4, no.3, p.379-89 (Fall 1983).

An ab initio study of $O=N-N=S$ with full geometry optimization has been carried out to corroborate the presence of an interaction between the terminal atoms in this type of structure, which, in $O=N-N=O$, apparently stabilizes the cis conformer. Using the unscaled 4-31G basis set with a full set of d functions on the sulfur, there is a potential minimum at the trans but not the cis geometry. A gauche conformer with a torsional angle of 77.2° is the most stable. With N_2O_3 this basis set gives potential minima at both the cis and trans geometries, but the trans conformer is slightly more stable, contrary to experiment and the results of (7,3) basis-set calculations reported in the literature in which Gaussian lobe functions were employed. Using a (9,5) basis set there is no longer a potential minimum at the cis geometry, and a gauche structure is more stable than the cis conformer as in the case of N_2O_5 with the less-extended basis set. Force constants (harmonic and anharmonic), compliance constants, relaxed force constants, and interaction-displacement coordinates for both molecules are compared for key structural elements. (31 refs.)

112649 Three-electron bonds. III. Phosphorus and chlorine σ^* radical cations. T.Clark (Inst. für Organische Chem., Friedrich-Alexander-Univ. Erlangen-Nürnberg, Erlangen, Germany).

J. Comput. Chem. (USA), vol.4, no.3, p.404-9 (Fall 1983).

For pt.II see *ibid.*, vol.3, p.112 (1982). The radical cations $H_3PPH_3^+$, $H_3PSH_2^+$, H_3PCIH^+ , and $HCICIH^+$ have been studied by ab initio molecular-orbital theory. An increasing tendency to adopt trigonal bipyramidal (TBP) geometries is observed for the phosphorus radicals with sulfur and chlorine ligands. The three-electron bond dissociation energies are calculated to be between 7 and 31 kcal mol $^{-1}$. The dependence of these bond energies on the ionization potentials for the neutral hydrides is illustrated, and the deformation of phosphorus σ^* radicals towards TBP structures is discussed. (22 refs.)

112650 'Frozen' transition states: pentavalent carbon et al. J.C.Martin.

Science (USA), vol.221, no.4610, p.509-14 (5 Aug. 1983).

Organic ligands have been designed for the stabilization of specific geometries of compounds of nonmetallic elements. These ligands have made possible the isolation, or direct observation, of large numbers of trigonal bipyramidal organo-nonmetallic species. Many of these species are analogs of transition states for nucleophilic displacement reactions and have been stabilized by the ligands to such a degree that they have become ground-state energy minima. Ideas derived from research on these species have been applied to carbon species to generate a molecule that is an analog of the transition state for the associative nucleophilic displacement reaction. The molecule is a pentavalent carbon species that has been observed by nuclear magnetic resonance spectroscopy. (29 refs.)

112651 Refinement of Ruedenberg-Mulliken MO LCAO method and calculation of SF_6 molecule. V.V.Kirsanov, V.A.Tskhai (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.601-11 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.654-65 (Nov.-Dec. 1982). [received: Sept. 1983]

An analysis of the approximations used in the RM method showed that its main shortcoming is the neglect of certain many-center two-electron integrals that arise in calculating the energy of energy interaction of the electrons. The authors have obtained more nearly exact expressions for the matrix elements of the secular equation, based on Mulliken's approximation and the approximation of the two-center two-electron Coulomb integrals by one-electron. They also present results from a calculation of the SF_6 molecule by the modified RM method. (25 refs.)

112652 $X\alpha$ calculations of the EPR parameters of pseudotetrahedral copper(II) complexes. A.Bencini, D.Gatteschi (Istituto di Chimica Generale, Univ. di Firenze, Florence, Italy).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5535-41 (24 Aug. 1983).

The self-consistent-field multiple-scattering $X\alpha$ method has been used to calculate the electronic structure of pseudotetrahedral and square-planar $CuCl_4^{2-}$ ions, with the aim of checking the reliability of the method in the calculation of the spectral (electronic and EPR) properties of transition metal complexes. Several different calculation schemes were used in order to improve the fit to the experimental spectral transitions. Overlapping spheres were found to give the best agreement. The values of g and of the ^{63}Cu hyperfine constant were satisfactorily reproduced, showing that the low value of the latter in the pseudotetrahedral ion is due to covalency effects and not to 4p metal orbital mixing into the ground state. (53 refs.)

112653 $X\alpha$ multiple scattering calculations on iron (ii) porphine. S.F.Sonnum, D.A.Case (Dept. of Chem., Univ. of California, Davis, CA, USA), M.Karplus.

J. Chem. Phys. (USA), vol.79, no.6, p.2881-92 (15 Sept. 1983).

Spin-restricted and spin-unrestricted $X\alpha$ multiple scattering calculations are reported for iron porphine with D_{4h} symmetry in the absence of axial ligands. A $^3A_{2g}$ ground state is predicted when the radius of the porphyrin 'hole' is less than 2.0 Å, whereas a quintet ground state is expected for larger Fe-N distances. A large asymmetry is found in the occupations of the three Fe4p orbitals. This has important implications for the interpretation of Mossbauer quadrupole coupling constants. Magnetic susceptibility and NMR results can be understood in terms of a model that involves spin-orbit mixing of an excited 3E_g state with the ground $^3A_{2g}$ state; an essential element in explaining the NMR data is that the proton hyperfine constants are not the same in these two states. Tentative assignments are given for observed absorptions in the optical and near-infrared regions. It is shown that spin-unrestricted wave functions are particularly suited for the qualitative interpretation of electronic structure of metalloporphyrins. (51 refs.)

112654 The Aufbau principle revisited. L.Bosi (Istituto di Fisica del Politecnico, Milano, Italy).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.2, p.89-96 (11 Aug. 1983).

A critical review of the Thomas-Fermi model applications in the literature concerning the Aufbau principle and its explanation is presented. The main conclusion is the following: a precise solution of the problem implies a new concept, that is the successive filling of $(n+l)$ groups. Furthermore, empirical rules introduced in the past in connection with the Aufbau principle are here presented in a simpler geometrical form and then explained. (11 refs.)

31.20N Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCIO methods, etc.)

112655 Application of INDO method to calculation of electronic structure and electronic spectra of transition-metal complexes. N.V.Ivanova, O.V.Sizova, V.I.Baranovskii (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).

J. Struct. Chem. (USA), vol.23, no.6, p.838-44 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.22-9 (Nov.-Dec. 1982). [received: Sept. 1983]

In the example of $Co(NH_3)_6^{3+}$ and $Co(CN)_6^{3-}$, an analysis has been made of the applicability of a new variant of the INDO method to the calculation of electronic structure and electronic spectra of complex compounds. The proposed parametrization is based on a system of parameters U_{ii} and γ_{AA} that was developed previously for the CNDO method, differing from the latter in the introduction of Slater-Condon parameters in accordance with the INDO approximation. It is shown that the scheme of MO levels and the distribution of electron density in the complexes that are obtained from these calculations are close to the analogous results obtained in CNDO calculation. At the same time, in comparison with the CNDO method, the INDO method gave a better reproduction of the splitting between the excited terms $^1T_{1g}$ and $^1T_{2g}$ that arise as a result of d-d transitions and between singlets and triplets $^1T_{1g}$ and $^3T_{1g}$. Consideration is given to the influence of breakdown of rotational invariance in the INDO method on the results from calculations of the electronic spectra of complex compounds. (24 refs.)

112656 Electronic structure and absorption spectra of phenol and the corresponding phenoxy radical and the cation and anion. L.S.Degtyarev, L.F.Protopenova, V.D.Pokhodenko (Acad. of Sci., L.V. Pisarzhevskii Inst. of Phys. Chem., Ukrainian SSR).

J. Struct. Chem. (USA), vol.23, no.6, p.860-4 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.48-52 (Nov.-Dec. 1982). [received: Sept. 1983]

The equilibrium geometry of phenol, the phenolate anion, and the phenoxylium cation has been calculated in the INDO approximation, and the energies

of the transitions in their electronic absorption spectra have been calculated by the CNDO/S method. The difference in the g-factors of the phenoxyl radical and the benzyl radical, which is iso- π -electronic with it, has been used to find the energy of the $n \rightarrow \pi^*$ electronic transition of PhO \cdot . The data obtained have been compared with the experimental results. (32 refs.)

112657 Molecular mechanics studies of enthalpies of formation and strain energies of azoalkanes. K.Bystrom (Thermochem. Lab., Univ. of Lund, Lund, Sweden).

J. Comput. Chem. (USA), vol.4, no.3, p.308-12 (Fall 1983).

A force field has been developed, on the basis of available experimental and partial retention of diatomic differential overlap (PRDDO) data, to permit molecular mechanics calculations on azoalkanes. The calculated structures and enthalpies of formation are in fair agreement with experimental results. The calculated enthalpies of formation and strain energies are compared with the corresponding quantities for analogous azoalkanes. (13 refs.)

112658 Properties of excited states of aromatic rings containing nitrogen.

K.Jug, G.Hahn (Dept. of Theoretische Chem., Univ. Hannover, Hannover, Germany).

J. Comput. Chem. (USA), vol.4, no.3, p.410-18 (Fall 1983).

Quantum chemical calculations with the semiempirical molecular orbital (MO) method SINDO1 were performed on excited states of the following five- and six-membered heterocycles containing nitrogen: imidazole, pyrazole, pyridine, pyridazine, pyrimidine, pyrazine, and s-triazine. The geometries and adiabatic excitation energies of T_1 , S_1 , S_2 were calculated. The authors also present charges, bond orders, and dipole moments. Consequences of these results for UV spectroscopic data are discussed. (22 refs.)

112659 Quantum-chemical study of the electronic structure of unsaturated tetraazamacrocycles by the CNDO/2 method. I.P.Beletskii, Yu.I.Gorlov, V.I.Furman, K.B.Yatsimirskii (L.V. Pisarzhevskii Inst. of Phys. Chem., Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.673-7 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.730-4 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors present the results of quantum-chemical calculations of the electronic structure of a number of 14-membered macrocycles which differ in the degree of unsaturation of the ring. The aim of the work was to study the possible effect of the degree of unsaturation of the macrocyclic ligands on their complex-forming properties and on the change in the charge distribution in the molecules under consideration. The calculations were carried out by the LCAO MO SCF method in the CNDO/2 approximation. (21 refs.)

112660 Theoretical interpretation of results from spectroscopic investigation of some derivatives of phenoxa- and phenazasilenes. S.G.Semenov, V.O.Reikhsfeld, I.E.Saratov (Lensovet Leningrad Technol. Inst., Leningrad, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.677-80 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.734-7 (Nov.-Dec. 1982). [received: Sept. 1983]

The interest in the dihydroanthracene-type heterocyclic heteroorganic derivatives of phenoxa- and phenazasilenes is due to their antioxidant characteristics and biological activity. Such compounds have been investigated by many experimental methods. Valuable information on their electronic structure is provided, in particular, by photoelectron and ultraviolet spectroscopy and also by the study of charge-transfer complexes (CTC). The present work was devoted to interpretation of the spectroscopic data on the basis of LCAO-MO SCF calculations in the CNDO approximation for the $O(C_6H_4)_2SiHCH_3$ and $C_2H_5N(C_6H_4)_2SiHCH_3$ molecules. 112661 Topological effect on MO energies. III. Heterocyclic systems with non-isomorphic partial structures. W.Fabian, I.Motoc, O.E.Polansky (Max-Planck-Inst. für Strahlenchem., Mülheim, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.916-27 (Aug. 1983). For pt.II see ibid., vol.889, p.196 (1983). The approach of the S and T isomers is applied to eight pairs of topologically related heterocyclic molecules with non-isomorphic partial structures. The CNDO/2 calculations as well as the experimental data clearly support the TEMO predictions. (9 refs.)

112662 The electronic structure of the octa-sulphur molecule: an ab initio configuration interaction study. M.H.Palmer, R.H.Findlay (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.1032-4 (Sept. 1983). An ab initio SCF calculation of better than double zeta quality (192 basic functions) acted as a starting point for a configuration interaction (CI) study. The final CI with 3408 configurations showed that the 3d orbital density was reduced further than the initial value of 0.1 e; the SCF configuration was dominant, but an element of in-out correlation occurred, with incorporation of the orbital 1 a₂ in replacement for 1 b₁ being notable in many configurations. (14 refs.)

112663 MRD-CI potential surfaces using balanced basis sets. I. First-row diatomic hydrides. J.S.Wright, R.J.Williams (Ottawa-Carleton Inst. for Res. & Graduate Studies in Chem., Carleton Univ., Ottawa, Ontario, Canada).

J. Chem. Phys. (USA), vol.79, no.6, p.2893-902 (15 Sept. 1983). Multireference configuration-interaction (MRD-CI) methods are used to calculate binding energies, potential curves, and vibrational energy levels for the diatomic hydrides H₂, BH, CH, NH, OH, and FH. The curves are calculated

out to the dissociation limit. It is shown how the use of bond functions (located midway between the nuclei) play an essential role in augmenting the standard double-zeta plus polarization basis set. This provides a relatively small but balanced basis set which describes equally well both atomic and molecular regions. The potential curves are accurately fitted by generalized Morse functions over a range of distance which spans 90% of the well depth. Computed binding energies are within 0.1 eV of experimental values, except for the experimentally uncertain NH, which is within 0.2 eV of an estimated value. Potential curves and vibrational levels for H₂, OH, and FH agree well with spectroscopic (and RKR) values. vibrational levels and potential curves for the other hydrides are compared to theoretical values since few experimental data are known, with less good but still reasonable agreement. The selection/extrapolation and multireference features of the MRD-CI method provide good energy continuity at modest computational expense over the whole range of internuclear distances. (51 refs.)

112664 A comparative study of the molecules Cu₂ and Ag₂ by all electron ab initio HF-CI methods. I.Shim, K.A.Gingerich (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2903-12 (15 Sept. 1983).

In the present work the molecules Cu₂ and Ag₂ have been investigated using all electron ab initio Hartree-Fock (HF) and configuration interaction (CI) calculations. The basis sets used were of double zeta quality in general, but the 3d orbital for Cu and the 4d orbital for Ag were represented by triple zeta functions. The wave functions for the Cu₂ and the Ag₂ molecules have been analyzed in detail. Calculated spectroscopic constants have been derived and compared to experimental data, where available. Both for the Cu₂ and the Ag₂ molecules the calculated spectroscopic data vary considerably as the CI calculations exclude or include excitations from the valence d orbitals. The chemical bonds for both molecules are single bonds almost entirely due to s_g molecular orbitals. (28 refs.)

112665 Dissociation curves for nine low lying states of Ti₂ from REP CI calculations. P.A.Christiansen (Dept. of Chem., Clarkson Coll. of Technol., Potsdam, NY, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2928-31 (15 Sept. 1983).

Dissociation curves for nine low lying states of Ti₂ have been computed using relativistic effective potential and configuration interaction techniques. The authors can identify the molecular ground state as 0_g⁺ with a dissociation energy of 0.16 eV. 0_g⁺ and 1_g states are about 0.1 eV higher in energy. The computed vibrational frequencies for these states are well below values from the Ti₂ thermal emission spectrum. The discrepancy between the author's bond energy and the value (0.63 eV) given in recent mass spectrometric work is due, in part, to the use of inappropriate molecular parameters in the mass spectrometric analysis. (8 refs.)

112666 On the low-lying states of CuO. P.S.Bagus (IBM Res. Lab., San Jose, CA, USA), C.J.Nelin, C.W.Bauschlicher, Jr.

J. Chem. Phys. (USA), vol.79, no.6, p.2975-81 (15 Sept. 1983).

Self-consistent field and correlated wave functions have been computed for the ground and for several low-lying states of CuO. The ground state is X²Π and the lowest excited state, at ~8000 cm⁻¹ above X²Π, is a previously unidentified ²Σ⁺ state. The separation of these states is compared to that for the similar states of KO and is analyzed in terms of integrals between orbitals of the separated free ions. The authors consider a classification of the states of the molecule based on states of Cu⁺ and O⁻ which leads to a division into manifolds of states arising from Cu⁺ 3d¹⁰ and Cu⁺ 3d⁹ 4s¹. They predict that the states of the 3d⁹ 4s¹ manifold are 10000-30000 cm⁻¹ above the ground state and assign the observed A²Σ⁺ state at 16500 cm⁻¹ to this manifold. (18 refs.)

112667 Model-potential calculations of wavelengths, transition probabilities and lifetimes for core-excited quartet levels of Be II. C.Laughlin (Math. Dept., Univ. of Nottingham, Nottingham, England).

J. Phys. B (GB), vol.16, no.18, p.3329-38 (28 Sept. 1983).

A non-local model potential v_M , which approximates the interaction of the 1s and nl electrons in 1s nl ³L levels of Be III to high accuracy, is used to construct an effective two-electron Schrödinger equation for 1s2s nl ⁴L and 1s2p nl ⁴L core-excited levels of Be II. Wavefunctions for quartet levels of Be II are found by a configuration-interaction expansion in terms of antisymmetrised products of eigenfunctions of v_M and wavelengths, transition probabilities and radiative lifetimes are calculated. Some outstanding lines in the beam-foil spectrum of beryllium are discussed. (27 refs.)

112668 The importance of continuum d states for the interaction $nsnp^6 - ns^4d$ in the rare gases. H.Smid, J.E.Hansen (Zeeman Lab., Univ. of Amsterdam, Amsterdam, Netherlands).

J. Phys. B (GB), vol.16, no.18, p.3339-70 (28 Sept. 1983).

Calculations are described of the interaction between the $nsnp^6$ ²S term and the ns^2np^4md/ed^2S series in atoms isoelectronic with the halogens, particularly the rare gases. For the halogens, it has been found earlier that the interaction with the continuum d series is crucial for a correct description of the term structure. A similar, although weaker, effect of the continuum is established for the rare gases. Detailed results for the admixture of $nsnp^6$ ²S in bound and continuum d states are reported for Cl I, Ar II, K III and Kr II. Only in K III is the effect of the continuum found to be negligible. The present results are important for the interpretation of satellite structures connected with the ejection of an ns electron from the rare gases. It is shown that there is good agreement between the present calculations and the satellite intensities in photoelectron experiments. The experimental uncertainties in photoelectron experiments are at present the limiting factors in the comparison and the need for better experimental values in order to test the calculations is stressed. Disagreements are found between the calculations and the results of (e, 2e) experiments. These disagreements are attributed to difficulties in the interpretation of the (e, 2e) experiments. (40 refs.)

112669 Configuration differentiation and localized properties of orbitals in multiconfiguration SCF theory. V.A.Kuprievich (Inst. of Theoretical Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.595-600 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.648-54 (Nov.-Dec. 1982). [received: Sept. 1983]

In the Veillard and Clementi modification of the MC SCF theory (1967), which is also known as the MC SCF theory with pair excitations (PE MC SCF), use is made of a set of configurations including, along with the ground configurations, all doubly excited configurations with closed shells. Calculations of specific systems performed by this method show that the optimized MOs are localized; and the resultant wave function proves to be similar to a wave function in the form of the antisymmetrized product of strongly orthogonal geminals (APSG). In the APSG approximation, the localization of the orbitals predetermines the requirement of a minimum in the energy of the individual electron pairs; with the PE MC SCF, such a result is not obvious, since in the set of configurations, each of the occupied orbitals is formally linked in an identical manner to all of the unoccupied orbitals. The premises leading to localization of orbitals in the PE MC SCF theory are examined,

and the question of the most significant configurations responsible for intrapair electron correlation in the molecules is discussed. (11 refs.)

112670 Simple estimation of correlation effects in molecular systems with an open shell. G.E. Whyman, M.M. Mestechkin (Inst. of Phys. Organic Chem. & Coal Chem., Acad. of Sci., Donetsk, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.666-9 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.723-6 (Nov.-Dec. 1982). [received: Sept. 1983]

The use of different orbitals for different spins, which was subsequently transformed into the formalism of the spin-extended Hartree-Fock (EHF) method, was one of the very first techniques employed to take account of electron correlation in the multiparticle problem. The EHF technique involves two operations: spin projection and the subsequent minimization of the energy functional. The use of a single step in the gradient method with semiempirical determination of the scale factor for its approximate solution turned out to be fairly successful both in the PPP and the INDO computational schemes. Hence it is advisable that the above-mentioned procedure should be developed more consistently in order that it may also be used in nonempirical calculations. First of all, one should abandon the empirical determination of the step size which is insensitive to the difference between the unrestricted Hartree-Fock (UHF) and EHF wavefunctions. A solution to this problem is proposed, together with a simple technique for the estimation of the EHF energy which makes use of the energies obtained in the UHF method and the spin-projected version of this technique (SPUHF) without the enormous procedure of variation after projection. 31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

112671 Pseudo-Jahn-Teller effect as a source of tetragonal distortions in hexafluoride complexes. S.A. Borsch, I.Ya. Ogurtsov, I.B. Bersuker (Inst. of Chem., Acad. of Sci., Moldavian SSR).

J. Struct. Chem. (USA), vol.23, no.6, p.825-9 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.7-12 (Nov.-Dec. 1982). [received: Sept. 1983]

An analysis has been made of possible modes of realization of the pseudo-Jahn-Teller effect in e_g vibrations in octahedral hexafluoride d^0 , d^4 , and d^6 molecules. The extrema of the adiabatic potentials have been determined, and the corresponding equilibrium configurations have been found. It is shown that under certain additional conditions, the pseudo-Jahn-Teller effect may lead to observable tetragonal distortions of the d^0 and d^4 -hexafluoride complexes. (9 refs.)

112672 Isotope effects in molecular mechanics (MM2). Calculations on deuterium compounds. N.L. Allinger, H.L. Flanagan (Dept. of Chem., Univ. of Georgia, Athens, GA, USA).

J. Comput. Chem. (USA), vol.4, no.3, p.399-403 (Fall 1983). Parameters have been derived so as to enable the inclusion of deuterium in the MM2 molecular mechanics force field. Several compounds were studied and the results are compared with experiment. The results are never qualitatively wrong, but the accuracy ranges from excellent to only fair. They are quite good for hydrocarbons, but less so for ketones. (17 refs.)

112673 Isomeric groups and hyperfine structure of nonrigid molecules. H.H. Günthard (Phys. Chem. Lab., Eidgenössische Tech. Hochschule, Zurich, Switzerland).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.133-47

Hyperfine structure of energy levels and transitions of semirigid molecules will be discussed within the framework of the isometric group of such systems. Starting from transformation properties of electronic and rotation-internal motion energy eigenfunctions, transformation properties and Wigner-Eckart theorems for a number of typical hyperfine interactions of the Breit-Bethe-Salpeter molecular Hamiltonian will be presented. Applications to some semirigid molecules within the adiabatic Born-Oppenheimer approach will be made and attention paid to particular effects on hyperfine structure related to nonrigidity, in particular for internal rotation involving quadrupole and magnetic nuclei. (22 refs.)

112674 The Jahn-Teller effect as a case of electronic non-rigidity. Application to the ground state of the symmetric $C_6F_5H_3^+$ ion. C. Cossart-Magos (Lab. de Photophys. Moléculaire, Univ. de Paris-Sud, Orsay, France).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.265-72

The Jahn-Teller effect, considered as a case of 'electronic non-rigidity', is compared to the effect of stereochemical non-rigidity. The principal features of the potential surfaces and vibronic level displacements and splittings are recalled in the case of linear and linear plus quadratic Jahn-Teller effect induced by a single vibrational mode. Recent studies on the Jahn-Teller effect in the electronic degenerate ground state X^2E'' of the symmetrical-trifluorobenzene cation in the gas phase are reviewed. The latest developments due to vibronic analysis of high-resolution emission and laser induced fluorescence excitation spectra of both the hydrogenated and fully deuterated species are briefly presented. 31.50 EXCITED STATES

112675 Conversion of bound states to resonances with changing internuclear distance in molecular anions. J.G. Lauderdale, C.W. McCurdy (Dept. of Chem., Ohio State Univ., Columbus, OH, USA), A.U. Hazi.

J. Chem. Phys. (USA), vol.79, no.5, p.2200-5 (1 Sept. 1983).

The complex self-consistent field (CSCF) method has been used to compute the complex potential-energy curves of the lowest $2\pi_g^+$ autodetaching resonance state of F_2^- and the $2\Pi_g$ resonance state of N_2^- . The calculated width of the $2\Pi_g$ resonance of N_2^- as a function of internuclear distance is in excellent agreement with the results of previous calculations by other methods. The SCF energies of the anion and the neutral molecule in these examples cross at an internuclear distance different from that at which the SCF energy of the anion becomes complex. The authors find this to be a general feature of the SCF description of shape resonance states. Correlation effects appear to be of critical importance in determining the behavior of the resonance states in the crossing region. (21 refs.)

112676 Identification of the X state in Ca and a new Rydberg series. E.S. Chang (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA).

J. Phys. B (GB), vol.16, no.18, p.L539-41 (28 Sept. 1983).

The X state in Ca is identified as $4s5g^1G_4$ at $44874.5 \pm 0.2 \text{ cm}^{-1}$, and the upper states in the observed transitions are reassigned to the $4snh^1H_5$ series. The simple polarisation theory gives surprisingly good agreement with experiment for all the observed transitions. The extracted polarisability of $75.3 \pm 0.4 a_0^3$ is in excellent agreement with values calculated from oscillator strengths. (12 refs.)

112677 Synchrotron spectroscopy of the giant resonances in the lanthanides and actinides and its relevance to valence changes. J.P. Connerade (Blackett Lab., Imperial Coll., London, England).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.171-81 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The 'giant resonances' in the photoabsorption spectra of barium, lanthanum, the lanthanides and some actinides are discussed. They are quasi-atomic spectral features even when observed in related molecules and solids. Their study has led to a far greater understanding of the double-valley radial potential for f electrons and can indeed be viewed as a direct probe of its properties. The lanthanide contraction itself, which is responsible for the deep filling of the 4f and 5f subshells, is due to the quantum mechanics of the inner well. Dramatic changes in the atomic spectra for small changes in the potential have been observed. The atomic physics of this situation is described: it provides a simple model for a number of unusual atomic effects. It could also provide a driving mechanism for pressure-induced phase transitions in compounds such as SmS, and this suggestion is supported by an order-of-magnitude calculation. (26 refs.)

31.90 OTHER TOPICS IN THE THEORY OF ATOMS AND MOLECULES

(inc. properties other than energy)

- 112678 Nonrelativistic and quasirelativistic model potential calculations on AgH and Ag_2 . M.Klobukowski (Dept. of Chem., Univ. of Alberta, Edmonton, Alberta, Canada). *J. Comput. Chem. (USA)*, vol.4, no.3, p.350-61 (Fall 1983). The major relativistic effects are included into the model potential (MP) method of Bonifacic and Huzinaga (1974). The effects are incorporated on the level of Cowan and Griffin's relativistic Hartree-Fock (RHF) method (1976). The model potential parameters are determined using the results of nonrelativistic Hartree-Fock (NHF) and RHF calculations. A new scheme of selection of the basis functions for use in atomic and molecular MP calculations is proposed. To obtain agreement with the Hartree-Fock calculations on AgH and Ag_2 , the $4p$ shell has to be included explicitly in the MP calculations. The explicit treatment of the $4p$ electrons and the resulting reduction of the core size are necessary in order to overcome difficulties with approximate representation of the large $4p$ - $4d$ core-valence interactions on the MP level. 32.00 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

- 112679 Saturation spectroscopy of hydrogen H_α lines with a multi-mode CW dye laser. M.Schilling, R.Frankenberger, A.Bengtson, E.W.Weber (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany). *Z. Phys. A (Germany)*, vol.313, no.1-2, p.1-7 (1983). With an intense, broadband multi-mode CW dye laser collisional studies of H_α fine-structure resonances with saturated absorption are extended to He buffer gas pressures larger than 30 mbar (0°C). The broadening and shift of the two prominent $\text{H}_\alpha(2P-3D)$ transitions are measured in a (He+4% H) gas discharge. The absolute magnitude and the differences in the width of the lines are explained theoretically by different inelastic fine-structure transfer cross sections which can also be deduced from the pressure effect data. Nuclear polarization of hydrogen atoms by H_α optical pumping and polarization transfer to the $\text{H}(1S)$ ground state via Ly- α decay and further applications of the multimode laser are discussed. 32.50 FLUORESCENCE, PHOSPHORESCENCE

(inc. quenching)

- 112681 Kinetic study of $\text{Ca}(4^3\text{P}_1)$ by time-resolved emission, $4^3\text{P}_1 \rightarrow 4^1\text{S}_0 + h\nu$ ($\lambda = 657.3$ nm), following dye-laser excitation: spontaneous emission, diffusion and collisional quenching. D.Husain, J.Schifino (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England). *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.8, p.1265-81 (Aug. 1983). The authors present a kinetic study of the low-lying electronically excited state of atomic calcium, $\text{Ca}[4s4p(^3\text{P})_1]$, 1.885 eV above the $4s^2(^1\text{S}_0)$ ground state. $\text{Ca}(4^3\text{P}_1)$ was generated by dye-laser pulsed excitation at $\lambda = 657.3$ nm of calcium vapour [$\text{Ca}(4^3\text{P}_1) \leftarrow \text{Ca}(4^1\text{S}_0)$] at elevated temperatures (1000K), in equilibrium with solid calcium, in a slow-flow system, kinetically equivalent to a static system. Following rapid Boltzmann equilibration within $\text{Ca}(4^3\text{P}_1)$ through collisions, the forbidden time-resolved atomic resonance fluorescence at the same wavelength was monitored using boxcar integration. The decay of $\text{Ca}(4^3\text{P}_1)$ in the presence of all the noble gases, He, Ne, Ar, Kr and Xe, was studied, yielding measurements of relative diffusion coefficients. Extrapolation of the diffusional component of the decay in each noble gas to infinite pressure yields an independent value of the mean radiative lifetime for $\text{Ca}(4^3\text{P}_1) \rightarrow \text{Ca}(4^1\text{S}_0) + h\nu$ ($\lambda = 657.3$ nm), the average of which from the measurements in all the noble gases yields $\tau_0 = 0.34 \pm 0.02$ ms (error 2σ). This result is compared with values reported from previous measurements, particularly atomic beams and time-resolved measurements. The kinetic analysis also gives rise to data for the collisional quenching of $\text{Ca}(4^3\text{P}_1)$, which is insignificant for most of the noble gases [$k_{\text{He,Ne,Ar,Kr}} \leq 4 \times 10^{-15}$ cm³ molecule⁻¹s⁻¹ (1000K)], in contrast to measurements from earlier work using phase-shift techniques. Xenon, however, exhibited measurable rates of collisional quenching of $\text{Ca}(4^3\text{P}_1)$ characterised by $k_{\text{Xe}} = 2.4 \pm 0.3 \times 10^{-14}$ cm³ molecule⁻¹s⁻¹ (1000K). The time-resolved emission technique is further applied to the study of the removal of $\text{Ca}(4^3\text{P}_1)$ by added gases. (47 refs.)

32.60 ZEEMAN AND STARK EFFECTS

- 112682 Zeeman effect in the forbidden lines of antimony Sb I. J.Heldt, M.Hults (Dept. of Phys. & Astron., Ball State Univ., Muncie, IN, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1189-96 (Sept. 1983). The Zeeman effect was studied experimentally and theoretically for two mixed forbidden lines of Sb I. The experimental studies were performed on two separated isotopes (121 and 123) for two directions of observation, i.e. longitudinal (L) and transverse (π and σ) using a silver-coated Fabry-Perot etalon and a three-prism Steinheil spectrograph. The interference effect between M1 and E2 radiation in the $\Delta M = \pm 1$ Zeeman components has been observed in the 609.8-nm line. By using the percentage admixture of electric-quadrupole radiation predicted by Garstang (see J. Res. Nat. Bur. Stand., Sect.A, vol.68, p.61, 1964), the relative intensities of the $\Delta M = \pm 1$ and $\Delta M = 0$, ± 2 transitions of the hyperfine structure components were calculated as a function of the external magnetic field for both directions of observation. The agreement of the computed and experimentally determined relative intensities shows that the 609.8-nm line contains (1.43 \pm 0.45)% of electric-quadrupole radiation. In the Zeeman pattern of the 541.5-nm line of antimony, no interference effect is seen. Thus this line is of a predominantly magnetic-dipole type, which is in agreement with theoretical predictions. (16 refs.)
- 112683 High- n_1 Stark-state production by sudden electric-field reversal in Rydberg sodium. R.G.Rolfes, D.B.Smith, K.B.MacAdam (Dept. of Phys. & Astron., Univ. of Kentucky, Lexington, KY, USA). *J. Phys. B (GB)*, vol.16, no.18, p.L533-8 (28 Sept. 1983). By applying bipolar electric-field pulses of about 10 V cm⁻¹, $dE/dt \approx 10^9$ V cm⁻¹s⁻¹, the authors have demonstrated the conversion of laser-excited Na(nd) Rydberg states ($n = 30$ -38) to high- n_1 Stark states that lie at the top of the n manifold. These states correspond in zero field to orbits of the highest allowed angular momentum l . This transition phenomenon is believed to play an important role in the microwave electric-field ionisation of non-hydrogenic atoms. (18 refs.)

- 112684** Influence of SF_6 on the broadening and shift of the 535.0 nm thallium line. E.Lisicki, R.Bobkowski, J.Szudy, J.Wolnikowski (Inst. of Phys., Nicholas Copernicus Univ., Torun, Poland). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.838-40 (Aug. 1983). The pressure broadening and shift of the 535.0 nm Tl line resulting from the photodissociation of thallium iodide mixed with sulfur hexafluoride were studied at low densities using a Fabry-Perot interferometer. A linear variation of both the width and shift of the line with the SF_6 density was found and the cross sections for the broadening and shift were determined. (8 refs.)
- 112685** Revised $3p^63d^8\ ^1S_0$ level of Sr XIII, Y XIV, Zr XV, Nb XVI, and Mo XVII. J.Reader, A.Ryabtsev (NBS, Washington, DC, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1207-8 (Sept. 1983). Following an observation by Wyart et al. (see Phys. Sci., vol.26, p.141, 1982), the authors have revised the position of the $3p^63d^8\ ^1S_0$ level in Sr XIII, Y XIV, Zr XV, Nb XVI, and Mo XVII and have redetermined the $3p^63d^8$ energy parameters in these ions. (4 refs.)
- 112686** State dependent volume isotope shift analysis of the low lying states of Ba I and Ba II. B.Fricke, P.Grundevik, I.Lindgren, G.Olsson, T.Olsson, A.Rosen, G.Torbohm (Dept. of Phys., Chalmers Univ. of Technol., Goteberg, Sweden). *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.183-6 (29 Aug. 1983). Relativistic multi-configuration Dirac-Fock wavefunctions, coupled to good angular momentum J , have been calculated for low lying states of Ba I and Ba II. The resulting electronic factors show good agreement with data derived from recent high-resolution laser spectroscopy experiments and results from a comparison of muonic and optical data. (14 refs.)

32.80 PHOTON INTERACTIONS WITH ATOMS

- 112687** Compton profiles for polarised targets. D.A.Owen (Dept. of Phys., Ben Gurion Univ. of the Negev, Beer-Sheva, Israel), H.Grotch. *J. Phys. B (GB)*, vol.16, no.18, p.3371-81 (28 Sept. 1983). It is shown that the Compton profile functions which describe Compton scattering from polarised atomic electrons are independent of the scattering angle when the direction of polarisation is perpendicular to the incident photon direction. Explicit calculations of these functions for hydrogen-like atoms are given as well as the angular integrals for $J(P_z, \theta)$ (through $j=3/2$) when the radial wavefunctions are not known. Since for other directions of electron polarisations the profile functions are dependent on the scattering angle, the importance of the profile functions being independent of the scattering angle is discussed. (4 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

33.10 CALCULATION OF MOLECULAR SPECTRA

- 112692** Vibrational band intensities of hydrocarbons. L.Dixit, P.Kumar, R.B.Gupta, P.L.Gupta (Analytical Phys. Section, Indian Inst. of Petroleum, Dehradun, India). *Appl. Spectrosc. Rev. (USA)*, vol.18, no.3, p.373-443 (1982-1983). [received: Sept. 1983] The major goal of the article is to review recent chemical literature concerning theoretical predictions and experimental measurements of infrared and Raman intensities of hydrocarbons suited to the needs of physicists, chemists, and industrial vibrational spectroscopists. It is a formidable task to give all the references; thus only pertinent ones have been incorporated. The review begins with information on the principles and methods. The article includes a compilation of the intensity data of hydrocarbons and the minimum material required to understand and generate them. The infrared and Raman intensities are discussed side by side. (275 refs.)
- 112693** Spectroscopic energy coefficients for vibration-rotational states of dinuclear molecules. J.F.Ogilvie (Res. School of Chem., Australian Nat. Univ., Canberra, Australia). *Comput. Phys. Commun. (Netherlands)*, vol.30, no.1, p.101-5 (July-Aug. 1983). The spectroscopic energy coefficients Y_{kl} and their derivatives with respect to the parameters are calculated from a known set of the parameters: coefficients c_i ($1 \leq i \leq 10$) in the potential-energy function, and harmonic vibrational, ω_e , and rotational, B_e , quantities. (12 refs.)
- 112694** Effect of phase choices in rovibrational wavefunctions on the labeling of K- and I-type doubling in molecular energy levels. K.Yamada (Erses Phys. Inst., Univ. zu Koln, Koln, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.821-34 (Aug. 1983). The change in phase factor of the wavefunction does not affect the absolute value of the matrix element, but does change the phase factor of the off-diagonal matrix element. This phase dependence causes a serious confusion in the sign of some parameters in the molecular Hamiltonian, which appear only in the off-diagonal matrix element; for example, the sign of the I-type doubling constant q of a linear or a symmetric-top molecule. The energy eigenvalues, symmetry species, and labeling of the eigenfunctions are discussed for the K-type doubling of asymmetric-top molecules and for the I-type doubling of linear or symmetric-top molecules in relation to the choices of phases in the basis wavefunctions. (24 refs.)
- 112695** Molecular vibration analysis of the cage-like molecules β - P_4S_6 , As_4S_6 , P_4S_7 , and $As_2P_2S_7$. S.J.Cyvin, B.N.Cyvin (Inst. for Teoretisk Kjemi, Univ. i Trondheim, Trondheim, Norway), H.Motz, C.Wibbelmann. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.987-94 (Sept. 1983). The cage-like molecules β - P_4S_6 , As_4S_6 , P_4S_7 and $As_2P_2S_7$ are all supposed to have C_{2v} -symmetry. A normal coordinate analysis was performed for those molecules, based on a very simple initial force field with three numerical parameters and valence coordinates including redundancies. A complete set of symmetry coordinates is given. The force field was refined by adjusting the symmetry force constants to fit exactly a set of observed frequencies. This was used to calculate the mean amplitudes of vibration and perpendicular amplitude correction coefficients. The standard thermodynamical values derived from spectroscopic data are also given. A set of frequencies was calculated for the so far unknown compound P_4S_6 . (20 refs.)
- 112696** On the determination of moment of inertia of prolate luminescent molecules. A.Kawski (Inst. of Experimental Phys., Univ. of Gdansk, Gdansk, Poland). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.1040-1 (Sept. 1983). The possibility to determine simultaneously the effective volume and the molecular moment of inertia on the basis of the generalized equation of the rotational motion of prolate luminescent molecules in solutions is discussed. (15 refs.)
- 112697** Vibronic coupling of electronic states. III. The definitive breakdown of the CBO potential picture within the framework of our model. K.Gustav, R.Colditz (Sektion Chem., Friedrich-Schiller-Univ. Jena, Jena, Germany). *Int. J. Quantum Chem. (USA)*, vol.24, no.3, p.327-32 (Sept. 1983). For pt.II see ibid., vol.22, p.31 (1982). The definitive breakdown of the CBO potential picture in consequence of the vibronic coupling of two electronic states is discussed on the basis of the authors' model. The present treatment differs from that given in the literature. (6 refs.)
- 112698** The vibronic analysis of the vapour-phase ultraviolet absorption frequencies of 2,3-dichloropyridine. K.C.Medhi (Dept. of Phys., Gauhati Univ., Gauhati, India). *Indian J. Phys. Part B*, vol.57B, no.3, p.262-3 (June 1983). In a previous paper (Medhi 1982) the frequencies of ultraviolet absorption of 2,3-dichloropyridine in the vapour state in the region 2850-2500 Å due to the $\pi \rightarrow \pi^*$ transition were reported. The 0,0 band and the four ground state and six excited state fundamental frequencies were identified. The present notes give a detailed vibronic analysis of the observed frequencies of the molecule in the gaseous state. (1 ref.)

112699 Nitric oxide vibrational excitation from the $N(^4S)+O_2$ reaction. R.R.Herm, B.J.Sullivan, M.E.Whitson, Jr. (Chem. & Phys. Lab., Aerospace Corp., Los Angeles, CA, USA).

J. Chem. Phys. (USA), vol.79, no.5, p.2221-30 (1 Sept. 1983). Measurements of the vibrational distribution of NO produced in a room temperature flowtube study of $N(^4S)+O_2 \rightarrow NO(0 \leq v \leq 7)+O$ are reported. Ultraviolet laser induced fluorescence detection of NO(v) in levels $v=0-7$ was employed to study NO production under conditions where O_2 vibrational quenching was insignificant. The results indicate that 42% of the NO molecules are produced in infrared-active states, 38% of them in levels ≥ 2 . This is considerably more NO vibrational excitation than had been inferred from infrared chemiluminescence studies. Moreover, production of infrared active states of NO by the $N(^4S)+O_2$ reaction may be even more efficient than these numbers indicate owing to possible vibrational relaxation of the nascent NO(v) distribution by nitrogen atoms in the flowtube. (42 refs.)

112700 Nascent NO vibrational distribution from 2485 Å NO_2 photodissociation. T.G.Slanger, W.K.Bischel, M.J.Dyer (Molecular Phys. Lab., SRI Internat., Menlo Park, CA, USA).

J. Chem. Phys. (USA), vol.79, no.5, p.2231-40 (1 Sept. 1983). The initial NO vibrational level distribution has been determined for NO_2 photodissociation at 2485 Å. Excitation spectra of the NO vibrational levels were measured by using both the $NO A^2\Sigma^+ \leftarrow X^2\Pi$ and $B^2\Pi \leftarrow X^2\Pi$ transitions, the latter being somewhat stronger due to saturation effects. It was determined that the NO population was strongly inverted, with most of the nascent NO being in $v=6-8$; the thermodynamic limits is $v=8$. Injection locking of the KrF laser output permitted study of the 2491 Å NO_2 band, and it was evident that the increased absorption in this region gave greatly enhanced signal levels in the excitation spectra, at those wavelengths where NO_2 and NO absorption lines coincide. It was demonstrated that in the 2640-2850 Å wavelength region, NO_2 can be detected by use of a single dye laser, simultaneously dissociating NO_2 and electronically exciting the resultant vibrationally hot NO. Deactivation of $NO(v=8)$ by NO_2 was found to proceed with a rate coefficient of $1.1 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, whereas the coefficient for quenching by N_2 and He was $\leq 2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$. The peculiar NO rotational distributions noted by Zacharias et al. (1981) in their study of NO_2 dissociation at 3371 Å were also observed in the present work. (19 refs.)

112701 A unified molecular force field via a model theory of isoelectronic diatomic molecules. B.J.Laurenzi (Dept. of Chem., State Univ. of New York, Albany, NY, USA).

J. Chem. Phys. (USA), vol.79, no.5, p.2246-55 (1 Sept. 1983). Electronic energy curves for diatomic molecules come in a wide variety of shapes. More categorically, these correspond to stable, metastable or repulsive states. The authors propose that a great deal of this apparently diverse behavior might in fact be contained in a single isoelectronic energy surface $E(R,Z,Z')$. That is, each kind of curve can be thought of as a particular cross section of the surface corresponding to some range of the nuclear charges Z and Z' . Analytic representations for these surfaces have been given and their properties examined. The authors have found that they are folded and contain critical points. These features put limits on the number of isoelectronic species that can exist in a sequence and interconnect their properties. By this the authors understand that data gathered on even the repulsive states of one molecule of an isoelectronic sequence contains information about the stable and metastable members of that sequence. (13 refs.)

112702 Algebraic approach to molecular rotation-vibration spectra. II. Triatomic molecules. O.S.van Roosmalen (Kernfysisch Versneller Inst., Rijksunivers. Groningen, Groningen, Netherlands), F.Iachello, R.D.Levine, A.E.L.Dieperink.

J. Chem. Phys. (USA), vol.79, no.6, p.2515-36 (15 Sept. 1983). For pt.I see ibid., vol.77, no.6, p.3046-55 (1982). The algebraic approach to molecular rotation-vibration spectra introduced in a previous article is extended from di- to tri- and polyatomic molecules. The spectrum generating algebra appropriate to triatomic molecules $U(4) \otimes U(4)$ is explicitly constructed. Its dynamical symmetries and their relation to rigid, nonrigid, linear, and nonlinear structures are discussed. Applications to the spectra of HCN, CO_2 , and H_3^+ are considered. In particular, it is shown that the algebraic description can account for the Fermi resonances occurring in CO_2 . Some remarks are made on the spectrum generating algebras appropriate to polyatomic molecules. (37 refs.)

112703 Nonadiabatic representations of the $^1\Sigma_u^+$ and $^1\Pi_u$ states of the N_2 molecule. D.Stahel, M.Leoni, K.Dressler (Phys. Chem. Lab., ETH-Zentrum, Zurich, Switzerland).

J. Chem. Phys. (USA), vol.79, no.6, p.2541-58 (15 Sept. 1983). The vibronic bands in the dipole-allowed absorption spectrum of N_2 associated with the lowest three electronic $^1\Sigma_u^+$ and the lowest three electronic $^1\Pi_u$ states are represented in a basis of electronically coupled diabatic states as well as in the basis of nuclear-momentum coupled adiabatic states. Parameters defining the diabatic states and their electronic coupling energies are first evaluated by fitting the eigenvalues of a vibronic interaction matrix to the observations. The coupled-oscillator equations are then solved directly by Johnson's numerical integration method and the diabatic representation is redetermined via the matrix method and coupled equations iteratively. The fit of the experimental vibronic terms, B values, and absorption intensities achieved with R-independent electronic coupling energies in a diabatic basis of valence and Rydberg-type states ($b'+c'+e'$) Σ_u^+ and ($b+c+o$) Π_u is satisfactory. Comparison with the corresponding adiabatic representation shows that the nonadiabatic perturbations are larger in that basis than in the diabatic one. The vibronic intensity distributions observed in the absorption spectrum show numerous interesting examples of intensity envelopes over discrete vibronic progressions with Fano-type resonance profiles as well as with distinctly non-Fano-type profiles which can be attributed to variations of the relevant coupling terms over the widths of the vibronic resonances. (36 refs.)

112704 The properties of LiH in its ground and first excited electronic state. D.M.Bishop, L.M.Cheung (Dept. of Chem., Univ. of Ottawa, Ottawa, Ontario, Canada).

J. Chem. Phys. (USA), vol.79, no.6, p.2945-50 (15 Sept. 1983). With the aid of recently produced potential curves for the $X^1\Sigma^+$ and $A^1\Sigma^+$ states of lithium hydride, the rovibronic energies of LiH have been calculated. From these energies the standard spectroscopic constants, have been evaluated. The effect on these constants of inclusion of adiabatic corrections (for diagonal nuclear motion) in the potential curves is discussed. The expectation values of certain powers of the electronic coordinates are also tabulated. (13 refs.)

112705 Vibrational frequencies from anharmonic ab initio/empirical potential energy functions: stretching vibrations of hydroisocyanic acid, phosphacetylene, isocyanocetylene, and phosphabutyne. P.Botschwin, P.Seibald (Fachbereich Chem., Univ. Kaiserslautern, Kaiserslautern, Germany).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.1-23 (July 1983).

Anharmonic potential energy functions for the stretching vibrations of HNC, HCP, HCP⁺, HC₂NC, and HC₂P have been constructed from ab initio calculations and little experimental information. Stretching vibrational frequencies are calculated by a variational method employing an approximate vibrational Hamiltonian which neglects the anharmonic coupling between stretching and bending modes. Equilibrium geometries are estimated for HC₂NC and HC₂P and quartic and sextic centrifugal distortion constants have been calculated. (46 refs.)

112706 Rotational energies of polar symmetric-top molecules in high electric fields. S.A.Maluendes, F.M.Fernandez, E.A.Castro (Seccion Química Teórica, INIFTA, La Plata, Argentina).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.24-35 (July 1983).

A method based on hypervirial theorems and perturbation theory is developed for calculating rotational energies of polar symmetric-top molecules in uniform electric fields. This procedure also provides expectation values of other physical observables such as the effective dipole moment. (20 refs.)

112707 Normal-coordinate analysis of retinal isomers and assignments of Raman and infrared bands. S.Saito, M.Tasumi (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).

J. Raman Spectrosc. (GB), vol.14, no.4, p.236-45 (Aug. 1983).

Normal-coordinate calculations have been performed for the all-trans, 9-cis, 11-cis and 13-cis isomers of retinal using a model structure in which the β -ionone ring was replaced with a simplified structure. Most of the Raman and infrared bands observed from these isomers in the solid state are assigned on the basis of the results of calculation. The vibrational characteristics of each isomer are discussed. (25 refs.)

112708 Vibronic activation of the CO molecule in transition-metal clusters in the one-parameter approximation. A.P.Svitin, S.S.Budnikov, I.B.Bersuker, D.V.Korol'kov (Inst. of Chem., Acad. of Sci., Kishinev, Moldavia SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.637-42 (Nov.-Dec. 1982). Translation of: *Theor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.694-9 (Nov.-Dec. 1982). [received: Sept. 1983]

In order to study the high catalytic activity of transition-metal clusters in reactions involving carbon monoxide, the authors have investigated the vibronic activation of CO molecules in mononuclear $[Mo(CO)_6]$, binuclear $[Co_2(CO)_8]$, $Mn_2(CO)_{10}$, trinuclear $[Os_3(CO)_{12}]$, and hexanuclear $[Rh_6(CO)_{16}]$ complexes. In doing this, use was made of the vibronic theory of the elementary act of catalytic action. The greatest amount of attention has been paid to a consideration of the nature of the changes in the activation energies of reactions involving the participation of CO (regardless of the actual nature of the reaction) as a function of the mode of coordination of the CO groups in the clusters. Therefore, first of all, the authors considered the vibronic destabilization of a CO molecule upon its coordination to one or several (two-three) M atoms in mono- and polynuclear carbonyl complexes. (23 refs.)

112709 Symmetry classification of normal vibrations in molecules with internal rotation. G.A.Natanson (Chem. Dept., Univ. of Chicago, Chicago, IL, USA).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.201-18.

An important feature of the symmetry classification of normal vibrations in molecules with internal rotations is the fact that this classification may depend on nuclear masses and electronic structure of atoms. General rules limiting this ambiguity are formulated for the most common kinds of molecules. The most important property for the problem in question is the behavior of potential surfaces. Three kinds of behavior can be distinguished: noncrossing potential surfaces, surfaces having intersections in some configurations and pairs of surfaces coincident when all vibrational coordinates take zero values. All those cases are discussed in detail. (43 refs.)

- 112710** The Duschinsky effect and optical spectra. G.Olbrich, H.Kupka (Max-Planck-Inst. für Strahlenchem., Mulheim, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.937-46 (Aug. 1983). The influence of the normal mode rotation (i.e. the Duschinsky mixing) on the molecular electronic spectra in polyatomic molecules is treated by means of multidimensional intramolecular distributions (MID). It is shown that symmetry properties of the two-dimensional MID which relate emission and absorption spectra or pertain to the exchange of modes do not exist if the number of non-separable modes exceeds 2. Specific examples of emission band shapes are calculated for weakly (linear) coupled electronic states for both, zero and finite temperatures. The strength of the mixed quadratic interaction parameter is shown to influence the shape considerably. (7 refs.)
- 112711** Reexamination of the I₂ spectrum near the B(³Π_{0u}⁺) state dissociation limit. J.W.Tromp, R.J.Le Roy (Guelph-Waterloo Center, Univ. of Waterloo, Waterloo, Ontario, Canada), S.Gerstenkorn, P.Luc. *J. Mol. Spectrosc. (USA)*, vol.100, no.1, p.82-94 (July 1983). The disagreement of Danyluk and King's (Chem. Phys., vol.25, p.343 (1977)) rotational constants for levels lying near the dissociation limit of B-state I₂ and the mechanical behaviour predicted by near-dissociation theory is investigated. The discrepancies are shown to be much too large to be explained by either the neglect of centrifugal distortion effects in the original analysis or by rotational or spin-rotation coupling to a nearby repulsive I_u state. These differences are therefore attributed to experimental error, a conclusion which is confirmed by more recent experimental results. A reanalysis of the best available data for levels near the dissociation limit of B-state I₂ then yields improved values for the B-state dissociation limit $D_0=20043.16(\pm 0.02)$ cm⁻¹ of the vibrational index at dissociation $\nu_D=87.32(\pm 0.04)$ and of the long-range potential constant $C_5=2.88(\pm 0.003)\times 10^3$ cm⁻¹ Å⁵. This in turn implies a slightly improved groundstate dissociation energy of $D_0=12440.18(\pm 0.02)$ cm⁻¹. (25 refs.)
- 112712** Polarization spectroscopy of the E₀⁺-B₀⁺ band system of Br₂. J.C.D.Brand, U.D.Deshpande, A.R.Hoy, S.M.Jaywant (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada). *J. Mol. Spectrosc. (USA)*, vol.100, no.1, p.143-50 (July 1983). The E-B(O₀⁺-O₀⁺) band system of Br₂ has been investigated at Doppler-limited resolution using polarization labeling spectroscopy. Merged E state data for the three naturally occurring isotopes in the range $\nu_E=0-16$, expressed in terms of the constants for ⁷⁹Br₂, are (in cm⁻¹) $Y_{0,0}=48777.962(54)$, $Y_{1,0}=150.834(22)$, $Y_{2,0}=-0.4182(28)$, $Y_{3,0}=6.6(11)\times 10^{-4}$, $Y_{0,1}=4.1876(28)\times 10^{-2}$, $Y_{1,1}=-1.607(16)\times 10^{-4}$, and $Y_{0,2}=1.39(39)\times 10^{-8}$. The bond distance is $r_e=3.194$ Å, and the diabatic dissociation energy to Br^{(3)P₂}+Br^{(1)S₀} is 34700 cm⁻¹. (11 refs.)

112713 Possibility of constructing a general semiempirical theory of the vibrational and electronic-vibrational spectra of multiautomic molecules.

L.A.Gribov, V.I.Baranov.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1445-50 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1016-22 (Dec. 1982). [received: Sept. 1983]

The possibility of constructing a semiempirical scheme for the solution of the complete nonadiabatic electronic-vibrational problem on the basis of a system of semiempirical parameters adequately reflecting the electronic-vibrational interactions in the molecule, and thereby the same for the description of all possible electronic-vibrational spectra of multiautomic molecules, is considered. (8 refs.)

112714 Vibrational spectra and structure of triazaphosphorines. E.A.Romanenko, S.V.Iksanova, Yu.P.Egorov, P.P.Kornuta, T.N.Kasheva (Inst. of Organic Chem., Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.654-60 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.710-17 (Nov.-Dec. 1982). [received: Sept. 1983]

The π-electronic system of the triazaphosphorine heterocyclic ring has a decisive influence on the spectral-structural properties of the series of 1,3,5,2λ²-triazaphosphorines. The results of the calculation of frequencies and forms of in-plane normal vibrations of tetrachloro-1,3,5,2λ²-triazaphosphorines (TTP) are presented, the stretching and in-plane deformational vibrations of the heterocyclic ring in the series of substituted triazaphosphorines are assigned, and force fields and matrix elements, the charge-bond order (in the PPP/CI approximation) are calculated and compared for the molecules of TTP and pentachloro-1,3,2λ⁵-diazaphosphorine (PDP). 112715 The rotational spectra of fluorinated acetonitriles; ¹⁴N-nuclear quadrupole hyperfine structures measured with a microwave Fourier transform spectrometer. W.Kasten, H.Dreizler (Inst. für Phys. Chem., Univ. Kiel, Kiel, Germany), B.E.Job, J.Sheridan.

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.1015-21 (Sept. 1983). The microwave spectra of CF₃CN, CH₂FCN, CHDFCN, CD₂FCN and CHF₂CN have been measured and analysed. The nuclear quadrupole hyperfine splittings due to ¹⁴N have been measured by Microwave Fourier Transform spectroscopy. The nuclear quadrupole coupling constants, transformed to the bonding axis systems of the C≡N groups, are shown to be in accord with structural predictions of the p-electron populations at the nitrogen atom. (29 refs.)

112716 Nitrogen hyperfine structure in allyl cyanide synperiplanar—an application of microwave Fourier transform spectroscopy. G.Bestmann, H.Dreizler (Inst. für Phys. Chem., Christian-Albrechts-Univ. Kiel, Kiel, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.1044-5 (Sept. 1983). With the help of microwave Fourier transform spectroscopy the authors were able to resolve the nitrogen hyperfine structure of allyl cyanide (synperiplanar) (cis). As the rotational relaxation is relatively rapid this molecule is even for this technique at the limit of the present possibilities. (6 refs.)

112717 Microwave spectra of cyclohexyl bromide and cyclohexyl iodide. D.Damiani, F.Scappini, W.Caminati, G.Corbelli (Istituto di Spettroscopia Molecolare, CNR, Bologna, Italy).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.36-53 (July 1983). The microwave spectra of cyclohexyl bromide and cyclohexyl iodide have been investigated in the gas phase between 8 and 40 GHz. While the cyclohexyl bromide only low resolution spectra have been recorded, for cyclohexyl iodide high resolution spectra of both the equatorial and the axial isomer have been analyzed. The energy difference between the axial and the equatorial form is $\Delta G^0=0.8\pm 0.4$ kcal/mol and $\Delta E_{0,0}=0.54\pm 0.15$ kcal/mole in C₆H₁₁Br and C₆H₁₁I, respectively, the equatorial forms being more stable. Iodine nuclear quadrupole coupling constants for equatorial and axial C₆H₁₁I have been obtained. The present analysis contributes to the microwave investigation of the cyclohexyl halides. (24 refs.)

112718 Microwave spectroscopic study of the SiF radical. M.Tanimoto (Sagami Chem. Res. Center, Nishi-Ohnuma, Kanagawa, Japan), S.Saito, Y.Endo, E.Hirota.

J. Mol. Spectrosc. (USA), vol.100, no.1, p.205-11 (July 1983). The microwave spectrum of the SiF radical was observed in both ²Π_{1/2} and ²Π_{3/2} of the ground vibronic state. The SiF radical was produced by a DC discharge either in a SiF₄/SiH₄ mixture or in a transient molecule SiF₂ generated by the reaction of SiF₄ with heated solid silicon. The latter gave twice as intense a spectrum. A least-squares fit to the observed spectrum showed the rotational constant and the centrifugal distortion constant to be 17350.2752(63) and 0.03188(13) MHz, respectively, with three standard errors in parentheses applying to the last digits of the constants. The lambda-doubling parameter *p*₀ was found to be negative, -87.67 MHz, indicating that the $^2\Sigma^+$ excited state contributions dominate over those of $^2\Sigma^-$. All four hyperfine coupling constants *a*, *b*, *c*, and *d* were determined and were employed to discuss the unpaired-electron spin and orbital distributions in the SiF radical. (20 refs.)

112719 Symmetry and microwave spectrum of nitromethane. G.O.Sorensen, T.Pedersen (Dept. of Chem. Phys., Univ. of Copenhagen, Copenhagen, Denmark).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.219-36. Concerned with the problems of symmetry and dynamics of nitromethane-like molecules which are representatives of the class of molecules with a C_{3v} top and a C_{2v} frame. These molecules invariably have low barriers to internal rotation, and the internal rotation angular momentum quantum number, *m*, is therefore a reasonably good quantum number. Previously the spectra of molecules belonging to this class have been analyzed on the basis of the rigid top/rigid frame (RTRF) model assuming an invariance group isomorphic with D_{6h}. It is demonstrated that the Longuet-Higgins approach to symmetry of nonrigid molecules implies an invariance group isomorphic with D_{3h} and it appears that the 'symmetry breaking' terms are crucial for the analysis of the

112734 Nitrite and nitrate ions as infrared pressure gauges for diamond anvils. D.D.Klug, E.Whalley (Div. of Chem., Nat. Res. Council, Ottawa, Canada). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1205-8 (Sept. 1983). The infrared spectra of the antisymmetric stretching bands of dilute solutions of nitrite and nitrate ions in sodium bromide are proposed as pressure gauges for use with anvils and other apparatuses. Their frequencies, which are at 1279.0 and 1401.3 cm^{-1} respectively at zero pressure, were measured up to 186 kbar relative to the R_1 fluorescence line of ruby. The pressure is related to the shift $\Delta\nu$ of the frequency of the nitrite ion at 22°C from the zero-pressure value by the equation $\rho/\text{kbar} = 2.356(\Delta\nu/\text{cm}^{-1}) - 1.334(\Delta\nu/\text{cm}^{-1})\exp(-\Delta\nu/92 \text{ cm}^{-1})$, and to the shift $\Delta\nu$ of the frequency of the nitrate ion by the equation

$\rho/\text{kbar} = 1.775(\Delta\nu/\text{cm}^{-1}) - 0.7495(\Delta\nu/\text{cm}^{-1}) \times \exp(-\Delta\nu/78 \text{ cm}^{-1})$. Both equations were fitted by least squares, assuming that the error is in the pressure only, and the standard deviation of the pressure is 1.1 and 1.4 kbar, respectively. (14 refs.)

112735 Infrared and Raman study of the fast internal motions of non-rigid molecules in condensed state: method of selective deuteration. J.Lascombe, D.Cavagnat, J.C.Lassegues, C.Rafilipomanana (Lab. de Spectroscopie Infrarouge, Univ. de Bordeaux I, Talence, France). Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.237-46

The dynamical behaviour of non-rigid molecules in the gas state is now well known but very little information is available on these molecules in condensed state. The authors present a method of study based on the analysis of the infrared and Raman spectra of selectively deuterated molecules. It is applied to the nitromethane and cyclopentene molecules which provide respectively characteristic examples of methyl internal rotation and ring-puckering motion. In each case, an isolated CH or CD oscillator is modulated by the internal motion and several $\nu(\text{CH})$ or $\nu(\text{CD})$ bands are observed as a result of the dependence of the vibrational frequency of the oscillator on its conformational situation. Moreover, in the case of crystalline nitromethane a detailed study of the temperature dependence of the band profiles allows the main mechanism of relaxation of the CH oscillator to be deduced. 112736 The lineshape of motion-averaged isotropic Raman spectra. A.I.Burshtein, S.G.Fedorenko, A.Yu.Pusep (Inst. of Chem. Kinetics & Combustion, Novosibirsk, USSR).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.155-8 (2 Sept. 1983).

The conventional Kubo model can be used to describe the spectrum modulation by slow to fast motion, i.e. even in the range of applicability of perturbation theory. However, the Kubo model assumes the gaussian shape of static spectra. A model free of this assumption has been to show that experimental data can be interpreted provided the initial static spectrum has non-gaussian wings. (23 refs.)

112737 The Raman spectra and conformational change of simple sodium alkylsulfates and sodium alkylsulfonates in aqueous solution. T.Ikeda, T.Yoshida, H.Okabayashi (Dept. of Industrial Chem., Nagoya Inst. of Technol., Nagoya, Japan).

Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.1046-7 (Sept. 1983).

In order to study the polar group effect upon conformations about $\text{CH}_2\text{-CH}_2$ single bonds, the Raman spectra of simple sodium alkylsulfates and sodium alkylsulfonates were measured. The ethylsulfate ion ($\text{CH}_3\text{-CH}_2\text{-O-SO}_3^-$) in aqueous solution was found to take the trans form about the $\text{CH}_2\text{-O}$ bond in 0.67-5.41 mol/l. For the n-propylsulfonate ion the Raman line due to the gauche form about the $\text{CH}_2\text{-CH}_2$ bond was also observed, the trans form becoming predominant at higher concentrations. For the sulfate and sulfonate ions having butyl and hexyl chains, the concentration dependence of their molecular conformations was also investigated. (13 refs.)

112738 Raman and infrared excitation of local mode states in neopentane. B.R.Henry, A.W.Tarr (Dept. of Chem., Univ. of Manitoba, Winnipeg, Manitoba, Canada), O.S.Mortensen, W.F.Murphy, D.A.C.Compton.

J. Chem. Phys. (USA), vol.79, no.6, p.2583-9 (15 Sept. 1983).

The Raman spectrum of neopentane is measured in the regions of $\Delta\nu_{\text{CH}}=1$ and 2. The results are compared to the absorption spectrum of neopentane in the region from $\Delta\nu_{\text{CH}}=2$ to 5. The peak positions are calculated within the local mode model. The intensity patterns observed in both types of spectra are explained. In particular, electrical anharmonicity is found to make a significant contribution to the observed peak intensities. (16 refs.)

112739 Optical anisotropies of aromatic esters and of oligomers of poly(p-oxybenzoate). P.A.Irvine, B.Erman, P.J.Flory (IBM Res. Lab., San Jose, CA, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2929-35 (21 July 1983).

Optical anisotropies γ^2 of phenyl acetate (PA), methyl benzoate (MB), phenyl benzoate (PB), and of the trimer ($n=3$) and tetramer ($n=4$) of the p-oxybenzoate series $\text{C}_6\text{H}_4\text{CO}(\text{OC}_6\text{H}_4\text{CO})_{n-2}\text{OC}_6\text{H}_5$ have been determined from the depolarized Rayleigh scattering of their solutions in CCl_4 or, in the case of the trimer and tetramer, in dioxane. Molar Kerr constants ${}_mK$ of PA and of the trimer have been evaluated from the electric birefringences of their solutions in CCl_4 and dioxane, respectively; the ${}_mK$ for MB and PB have been taken from the work of Le Fevre and Sundaram (1962). The observed values of γ^2 and ${}_mK$ are well reproduced by calculations based on anisotropy tensors $\hat{\alpha}$ for the optical polarizabilities of the homologous aromatic esters formulated from a plausible set of mutually consistent polarizability parameters for the ester group and for the phenyl and phenylene groups, with allowance for inductive effects of substitution. The validity of a constitutive scheme for constructing the polarizability tensors, and for treating properties related thereto, is thus demonstrated. The molar Kerr constant ${}_mK$ is very sensitive to

the direction of the dipole moment in the plane of the ester group. From the values found for ${}_mK$ for the aromatic esters, the authors obtain $\tau_E=123\pm3^\circ$ for the angle between the dipole moment and the C-CO axis, in excellent agreement with previous determinations by other means. (20 refs.)

112740 High-resolution stimulated Raman spectroscopy of O_2 . R.A.Hill, P.Esherick, A.Owyoung (Sandia Nat. Lab., Albuquerque, NM, USA).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.119-33 (July 1983).

High-resolution (0.002 cm^{-1}) stimulated Raman spectroscopy has been applied to the study of both normal and satellite Q branches of the fundamental vibrational band of molecular oxygen. Using a pulsed molecular free-expansion jet to adiabatically cool the oxygen sample, satellite Q branches at 1554 and 1558 cm^{-1} that arise due to the splitting of the $^3\Sigma_g$ ground state by spin-spin and spin-rotation interactions were completely resolved for the first time. Measured intensity ratios for the $^{\Delta N}\Delta J(J,N)=Q(2,1)$ and $^{\Delta N}\Delta J(J,N)=Q(1,1)$ lines, and for the $^{\Delta N}\Delta J(J,N)=Q(2,1)$ and $^{\Delta N}\Delta J(J,N)=Q(1,1)$ lines compare favorably with that for a coupling case intermediate between Hund's cases (a) and (b). Depolarization ratios, measured for a series of Q-branch (unresolved) triplets, give a value of 0.164 \pm 0.004 for the depolarization ratio of the fundamental vibrational band. (21 refs.)

112741 Raman spectra of Cl_3^+ and Br_3^+ at 12K produced from the reaction of HCl or HBr with NO_2 . L.-H.Chen, E.M.Nour, J.Laane (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).

J. Raman Spectrosc. (GB), vol.14, no.4, p.232-5 (Aug. 1983).

The products of the reactions of HCl or HBr with nitrogen dioxide at 12K have been examined using Raman spectroscopy. For the NO_2+HCl reaction spectroscopic evidence for Cl_3^+ , asym- N_2O_2 , N_2O_3 , N_2O_4 , ClNO_2 , ClNO_3 , NO_2^+ , NO_2^- , and sym- N_2O_2 was found. For the reaction with HBr only Br_3^+ was detected due to resonance Raman enhancement effects. These results are consistent with the previously proposed gas-phase reaction scheme for $\text{HCl}+\text{NO}_2$. However, the reaction proceeds further at low temperatures to produce Cl_3^+ (or Br_3^+). The Raman frequencies for Cl_3^+ were observed at 515(ν_3), 462(ν_1), and 236 cm^{-1} (ν_2). The Br_3^+ resonance Raman spectra, which represent the first well documented spectra for this species, show strong fundamental bands at 281(ν_1) and 227 and 238 cm^{-1} (doublet for ν_2) as well as an overtone doublet at 471 and 487 cm^{-1} . (10 refs.)

112742 Raman spectra and vibrational dephasing of methylacetylene. V.F.Kalasinsky, T.S.Little (Dept. of Chem., Mississippi State Univ., Mississippi State, MS, USA).

J. Raman Spectrosc. (GB), vol.14, no.4, p.253-8 (Aug. 1983).

The Raman spectra of gaseous and liquid methylacetylene have been recorded. The spectrum of the gas provides new data for verifying the vibrational assignments of certain A_1 and E fundamentals. Some of the vibrations exhibit hot bands whose origins have been determined on the basis of their Raman intensities. The isotropic scattering for the three fundamentals in the liquid state was studied as a function of temperature. The hot band structure in the liquid state was modeled by using curve-fitting procedures and the assignments made for the gas phase. The isotropic bandwidths for the fundamentals were observed to increase with decreasing temperature, and the broadening is consistent with the existence of a weak hydrogen bond in pure methylacetylene. (24 refs.)

112744 Structure and dynamics of the non-rigid CONH unit in fundamental and excited states of its stretching mode. Influence of environment effects, side-chain substitutions and secondary structures. F.Fillaux (LASIR, CNRS, Thiais, France), M.Jaber, M.H.Baron.

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.247-56

Vibrational spectra (infrared, Raman and neutron inelastic scattering) or N-methyl acetamide ($\text{CH}_3\text{CONHCH}_3$) and its deuterated derivatives in various physical states show large amplitude motions for the torsional mode around the C-N bond and for the out-of-plane bending of NH(ND) groups. Potential functions with double minimum have been calculated which are consistent with the nonrigidity of this molecule. Infrared and Raman bands in the NH(ND) stretching region show rather complicated profiles which are ascribed to a strong coupling with bending modes and corresponding potential functions are estimated in the ν NH(ND) excited state. A general method for structure and dynamics studies of amides and peptides is presented and is used to discuss the influence of solvent or salt interactions, aliphatic side-chains and secondary structure of homopolypeptides. 112745 The 404.5-nm system of the ReO molecule. W.J.Balfour, R.S.Ram (Dept. of Chem., Univ. of Victoria, Victoria, BC, Canada).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.164-73 (July 1983).

Observations on the emission spectrum of ReO in the region 375-870 nm are reported. Five bands of a $\Delta\Omega=0$ system with (0,0) band at 404.5 nm have

been rotationally analyzed and the principal results for ^{187}ReO are (in cm^{-1}) $\nu_0 = 24\,709.90$, $B'_e = 0.3819$, $B''_e = 0.4252$, $\omega'_e = 874.8_2$, and $\Delta G^\circ(1/2) = 979.1_2$. Data on the minor isotopic species ^{185}ReO are also reported. It is suggested that broad rotational profiles found in bands near 842 nm may be due to nuclear hyperfine structure. (2 refs.)

112746 Ion-cluster formation and its effect on the electronic spectrum of radical-ion pairs. B.J.McClelland (Dept. of Chem., Univ. of Salford, Salford, England).

J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.8, p.1233-41 (Aug. 1983). The visible-region band in the spectrum of the lithium-benzophenone radical-ion pair is shifted towards the blue by added lithium bromide, and the effect has been interpreted in terms of the formation of multi-ion-pair clusters. A more consistent interpretation of the data can be given in terms of the formation of a well defined 1:1 (or possibly 1:2) electrostatically bound complex. A general theory is given for interpreting the effect of such complex formation on the band position, and it is deduced that the equilibrium constant for the formation reaction is 580 at room temperature. This value, and the observed magnitude of the spectral shift, agrees with predictions derived from a simple electrostatic treatment of the complex. (9 refs.)

112747 $\text{C}^2\Pi_u - X^2\Sigma^+$ transition of AlO . M.Singh, M.D.Saksena (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India). *Can. J. Phys. (Canada)*, vol.61, no.9, p.1347-58 (Sept. 1983). Several bands of the $\text{C}^2\Pi_u - X^2\Sigma^+$ transition of AlO in the region 2800-3400 Å have been photographed at high resolution. A unique and unambiguous analysis of the rotational structure has been done for the first time for the 2-0, 1-0, 2-1, 0-0, 1-1, 0-1, 1-2, and 0-2 bands of this system. Fairly accurate rotational constants B_{eff} and D_{eff} have been determined for the $v=2$, 1, and 0 levels of the $\text{C}^2\Pi_u$ state. Severe rotational perturbations have been observed in the $\text{C}^2\Pi_u$ state. Equilibrium rotational constants (in cm^{-1}) of the $\text{C}^2\Pi_u$ state are $B_e \approx 0.6049$ and $\alpha_e \approx 0.0046$. (15 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

112748 Carbon-13 NMR study on liquid crystal solutions. Chemical shift tensors in benzonitrile. B.M.Fung (Dept. of Chem., Univ. of Oklahoma, Norman, OK, USA).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5713-14 (24 Aug. 1983). Carbon-13 chemical shifts have been widely used in the study of molecular structure, motion, and properties. The components of the chemical shift tensor are a more sensitive probe into molecular structure than the trace alone. The most straightforward way of determining the chemical shift tensor is to perform a line-shape analysis of the proton-decoupled carbon-13 NMR spectrum of a polycrystalline solid. When there are overlapping signals, they can be resolved by using magic angle spinning, and the anisotropic patterns of individual signals can be reconstructed from the spinning sidebands or by using pulses synchronized with the rotation of the spinner. Another approach to measuring the chemical shift tensor is to study the NMR spectra of molecules in liquid crystal solutions. In the past, this has been limited to the investigation of very simple molecules, and compounds with carbon-13 enrichment were often used for carbon-13 NMR study. This is mainly due to problems in solvent interference and insufficient decoupling power in spectrometers designed for studying liquid samples. The first problem can be solved by using a simple spin-echo sequence of $90^\circ - \tau - 180^\circ - 2\tau - 180^\circ - \tau$ acquisition, and the second problem can be solved or at least reduced by using phase-alternated broad-band decoupling. The author reports the determination of carbon-13 chemical shift tensors of all carbon atoms in benzonitrile by this approach. (31 refs.)

112749 ^{35}Cl nuclear quadrupole resonance and infrared spectroscopic studies of 2,6-dichloro-4-nitrophenol-amine hydrogen-bonded adducts. E.Grech, J.Kalenki, Z.Malarski, L.Sobczyk (Inst. of Chem., Univ. of Wrocław, Wrocław, Poland).

J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.9, p.2005-12 (Sept. 1983). The charge distribution in hydrogen bridges of varying strengths in solid 2,6-dichloro-4-nitrophenol complexes has been studied using the n.q.r. technique. The dependence of the average ^{35}Cl n.q.r. frequencies, $\bar{\nu}_{\text{n.q.r.}}$, on the pK_a can be analyzed in terms of the proton-transfer equilibrium $\bar{\nu}_{\text{n.q.r.}}$ provides evidence for the existence of either a double-minimum potential function or one broad minimum. Infrared spectra of such complexes show very broad absorptions extending to the far-infrared, with numerous so-called 'Evans holes' and a weakening or complete disappearance of the protonic stretching vibration band in the usual range above 1800 cm^{-1} . (18 refs.)

112750 Computer-assisted pseudorotation analysis of five-membered rings by means of proton spin-spin coupling constants: program PSEUROT. F.A.A.M.de Leeuw, C.Altona (Gorlaeus Labs, Univ. of Leiden, Leiden, Netherlands).

J. Comput. Chem. (USA), vol.4, no.3, p.428-37 (Fall 1983). A computer method for the calculation of the pseudorotational parameters in five-membered rings from vicinal proton spin-spin coupling constants is described. Some typical problems met in practice are discussed. Applications of the program in the conformational analysis of some substituted cyclopentanes are presented. (28 refs.)

112751 Through-space effects on vicinal proton spin-spin coupling constants mediated via hetero atoms: nonequivalence of cis couplings in five-membered rings. F.A.A.M.de Leeuw, A.A.van Beuzekom, C.Altona (Dept. of Organic Chem., Univ. of Leiden, Leiden, Netherlands). *J. Comput. Chem. (USA)*, vol.4, no.3, p.438-48 (Fall 1983). Theoretical studies are presented, aimed at the elucidation of through-space effects exerted by bridge-head oxygen and nitrogen atoms on cisoidal proton spin-spin coupling constants in 7-hetero-substituted norbornanes. The finite perturbation theory intermediate neglect of differential overlap (INDO) self-consistent field (SCF) molecular orbital (MO) method, modified according to the description given by Barfield (1980), was employed. It is predicted that the known nonequivalence between $J_{\text{endo-endo}}$ and $J_{\text{exo-exo}}$ in norbornanes, which is in part mediated by the bridgehead methylene group (Barfield transmission effect), also occurs in 7-heteronorbornanes. A trend is recognized in which the nonequivalence induced by oxygen is rather smaller than that induced by the rear lobe of the N-H bond or by the nitrogen lone pair. The Barfield effect also explains the observed nonequivalence between cisoidal H-C^β-C^γ-H and H-C^γ-C^β-H couplings in prolines. The calculations also predict similar, though smaller, effects on cisoidal couplings in the tetrahydrofuran ring system. (27 refs.)

112752 Possible mechanism of extraspheric shifts of PWR signals in aqueous solutions of paramagnetic ions. V.V.Matveev (State Univ., Saransk, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.685-7 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.742-5 (Nov.-Dec. 1982). [received: Sept. 1983]

Paramagnetic shifts (PS) of PMR signals of acetone and certain other compounds were discovered in aqueous solutions in the presence of Co^{2+} , Fe^{2+} , and also of REE ions. These shifts are dipolar (pseudocontact) and occur during extraspheric interactions of metal ions with the above compounds. However, the reasons for these shifts remain far from clear, and no satisfactory explanation of the mechanism of their appearance is available in the literature. The author attempts to analyze the conditions required for the occurrence and experimental appearance of the dipole PS of the extraspheric ligands in aqueous solutions. (10 refs.)

112753 ^{19}F NMR spectra and structure of α,ω -diarylperfluoropolyenes. V.M.Yurchenko, M.M.Kremlev, Yu.A.Fialkov, V.P.Sass, V.A.Khranovskii, Yu.P.Egorov, L.M.Yagupol'skii (Inst. of Organic Chem., Acad. of Sci., Kiev, Ukrainian SSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.687-92 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.745-50 (Nov.-Dec. 1982). [received: Sept. 1983]

The work is concerned with interpretation of the ^{19}F NMR spectra of a series of α,ω -diarylperfluoropolyenes of type $\text{p-XC}_6\text{H}_4\text{-(CF=CF)}_n\text{-C}_6\text{H}_4\text{X-p}$, where $\text{X}=\text{H}$, CH_3 , CH_3O , $(\text{CH}_3)_2\text{N}$; $n=2-4$, to obtain more information on the relationship between spectral parameters and the structure of the fluorinated polyenes. The ^{19}F NMR spectra of α,β -difluorostilbenes ($n=1$) were studied previously. From the dependence of the NMR chemical shifts of ^{19}F nuclei on the electronic nature of the substituents on the benzene rings, it was concluded that the planarity of the α,β -difluorostilbene molecule is distorted. In the spectra of 1,4-diphenylperfluoro-1,3-butadiene ($\text{X}=\text{H}$, $n=2$), two doublets were observed with splitting at 130 Hz, from which a conclusion was made on the trans configuration of the fluorine atoms with respect to the double bonds. According to UV spectroscopy data, these double bonds form a nonplanar cisoid conformation. (21 refs.)

112754 Recent progresses in the applications of nuclear magnetic resonance to the conformations and dynamics of flexible molecules in solution. C.Chachaty, B.Perly, T.Zemb (Dept. de Phys. Chimie, CENS, Gif-sur-Yvette, France).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.273-90

Some recent applications of nuclear magnetic resonance to studies of small flexible molecules, micellar aggregates and macromolecules are reported. In several cases these investigations are performed by means of the relaxation of ^{13}C induced by a paramagnetic ion bound to the molecule. Comparing the data obtained with paramagnetic probes with very different electron spin relaxation times T_{1e} allows the determination of the conformer probabilities and of the rates of internal motions. 33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

112755 The configuration of the tin-centered radical $\text{R}_3\text{Sn(R=2,4,6-tri-}i\text{-propylphenyl)}$ as studied by ESR. M.Lehnig, Th.Apoussidis, W.P.Neumann (Lehrstuhl für Organische Chem., Univ. Dortmund, Dortmund, Germany).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.189-92 (2 Sept. 1983). ESR data of the stannyl radical ($i\text{-Pr}_3\text{Ph}$)Sn. At temperatures between -140 and $+200^\circ\text{C}$ are presented. In solution, the isotropic ^{119}Sn hyperfine coupling decreases with increasing temperature ($20^\circ\text{C} < T < 200^\circ\text{C}$) indicating that the radical is non-planar and configurationally stable. At -140°C in a toluene matrix, anisotropic features have been observed ($A_{\parallel}(A_{\perp}(^{119}\text{Sn}))=211\text{ mT}$, $A_{\parallel}(^{119}\text{Sn})=139\text{ mT}$; $g_{\parallel}=1.995$, $g_{\perp}=2.016$) leading to an out-of-plane angle of 12.7° . (25 refs.)

112756 ESR evidence for the formation of the ring-opened cation $\text{CH}_2\text{OCH}_2^+$ from ethylene oxide. L.D.Snow, J.T.Wang, F.Williams (Dept. of Chem., Univ. of Tennessee, Knoxville, TN, USA). *Chem. Phys. Lett. (Netherlands)*, vol.100, no.2, p.193-7 (2 Sept. 1983). ESR results show that the radical cation formed from ethylene oxide in the solid state is the ring-opened 2-oxa-trimethylene cation with a symmetrical (C_2) planar structure similar to that of the isoelectronic allyl radical. In contrast, the trimethylene oxide radical cation retains the ring structure of the parent molecule and its ESR parameters are characteristic of an oxygen-centred species. (17 refs.)

112757 Radical cations of aldehydes and ketones. M.C.R.Symons, P.J.Boon (Dept. of Chem., Leicester Univ., Leicester, England). *Chem. Phys. Lett. (Netherlands)*, vol.100, no.2, p.203-4 (2 Sept. 1983). The authors confirm the observation made by Snow and Williams (1983) in the previous letter that the quartet substructure observed in the ESR spectrum of acetaldehyde is due to hyperfine coupling to a single chlorine nucleus of the solvent, fluorotrichloromethane. Reasons for this reversible interaction, and its absence for other similar cations are discussed. (8 refs.)

112758 ESR spectra and structures of radical cations of some branched alkanes: β -proton couplings in C-C σ cations. K.Nunome, K.Toriyama, M.Iwasaki (Government Industrial Res. Inst., Nagoya, Japan). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2499-503 (15 Sept. 1983).

The systematic ESR studies of radical cations of five kinds of methyl substituted butanes show that the unpaired electron is rather confined to one of the C-C σ bonds in contrast to the linear alkane cations, in which the unpaired electron delocalizes over the entire σ molecular chain. Analyses of the origin of the trans C-H β proton couplings indicate that spin transfer due to hyperconjugation plays an important role in these branched alkane cations. It is also shown that the hyperconjugative effect in these branched alkane cations is two times higher than that in the neutral alkyl π radicals. The large difference of the front and back lobe interactions in the β -proton couplings in these C-C σ radicals is attributable to the bent structure of the radical carbon atom. The front lobe interaction is about one-half of that of the back lobe interaction as is the case of vinyl radicals. (16 refs.)

112759 Influence of the N-oxide group in biradicals of the imidazole series in the intramolecular spin exchange over systems of conjugated bonds. I.A.Grigor'ev, S.A.Dikanov, G.I.Shekunin, L.B.Volodarskii, Yu.D.Tsvetkov (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.870-5 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.59-65 (Nov.-Dec. 1982). [received: Sept. 1983]

Nitroxyl radicals were synthesized with a rigid system of conjugated bonds, containing both imidazole and imidazole oxide, as well as imidazole and imidazole oxide radical fragments. The EPR method was used to study the characteristic features of intramolecular electronic spin exchange in nitroxyl biradicals of the imidazole series with a rigid system of conjugated multiple bonds. It was shown that the introduction of the N-oxide group into the imidazole radical fragment leads to considerable increase (tens of times) in the value of the exchange integral, characterizing the electronic spin exchange over the system of conjugated bonds. (16 refs.)

112760 Electron spin resonance investigation of cation-radical salts of N,N,N',N' -tetramethyl- p -phenylenediaminium (TMPD) hexafluorophosphate, hexafluoroarsenate and hexafluoroantimonate. H.Fujita (Coll. of Liberal Arts & Sci., Kyoto Univ., Kyoto, Japan). *J. Chem. Soc. Faraday Trans. I (GB)*, vol.79, pt.9, p.2077-83 (Sept. 1983). The cation-radical salts of N,N,N',N' -tetramethyl- p -phenylenediaminium (TMPD) hexafluorophosphate, hexafluoroarsenate and hexafluoroantimonate have been isolated. The temperature dependences of the hyperfine splitting constants of these salts have been investigated in solution. Also, it was found by means of e.s.r. spectroscopy that these salts follow the Curie-Weiss law in the solid state. (19 refs.)

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

112761 A four-level double resonance experiment on HCCC^{15}N with a bridge type superheterodyne microwave spectrometer. H.Bomsdorf, H.Dreizler (Inst. für Phys. Chem., Univ. Kiel, Kiel, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.1003-9 (Sept. 1983).

A four-level double resonance method has been developed allowing the determination of the relative collision induced change in signal intensity η without application of the Stark modulation technique. The method is based on certain properties of the bridge type superheterodyne spectrometer and may be applied to molecular transitions showing strong microwave absorption. η -values have been determined for various four-level systems consisting of $|M|$ -resolved rotational levels of the linear molecule HCCC^{15}N . In addition to the measurements on the pure substance the influence of foreign gas admixtures with H_2 , He, Ne and Ar on the results has been investigated. (14 refs.)

33.35H MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)

112762 Phosphorescence and triplet-state optically detected magnetic resonance studies of acetylacetonates of the ammonium and some group 2 metal ions. J.J.Sabbari, K.D.Bomben, D.S.Tinti (Dept. of Chem., Univ. of California, Davis, CA, USA).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5577-83 (24 Aug. 1983). The phosphorescence and triplet-state optically detected magnetic resonance (ODMR) spectra of NH_4^+ , Be^{2+} , Mg^{2+} , Zn^{2+} , Ca^{2+} , and Ba^{2+} complexes of acetylacetonate are reported in EPA glass and for the group 2 complexes as neat crystals. The phosphorescence origins, phosphorescence lifetimes, and fine structure splittings of the $\pi\pi^*$ triplet state localized on the acetylacetonate anion are dependent on the cation. The results are compared to earlier studies of group 1 metal acetylacetonates and show a correlation to the cation radius that extends over the ammonium and group 1 and 2 metal complexes. An electrostatic perturbation of the acetylacetonate anion by the cation seems able to explain the observed variations in the triplet-state properties. (21 refs.)

112763 Vibration-rotation coupling in anisotropic environments. II. Quadrupolar couplings of methanes in liquid crystals. J.G.Snijders, C.A.de Lange (Dept. of Theoretical & Phys. Chem., Free Univ., Amsterdam, Netherlands), E.E.Burnell.

J. Chem. Phys. (USA), vol.79, no.6, p.2964-9 (15 Sept. 1983). For pt.1 see *ibid.*, vol.76, p.3474 (1982). It is shown that deuterium quadrupolar couplings observed when the deuterated methanes are dissolved in liquid crystals can be understood on the basis of the same vibration-rotation coupling mechanism which can explain the measured dipolar couplings. Two quantities are obtained from the analysis: (i) the electric field gradient at the site of the deuterium nucleus when the deuterated methane possesses its equilibrium geometry; and (ii) the derivative of this field gradient with respect to the F_2 stretch symmetry mode, taken at the equilibrium geometry. In order to obtain consistency, the presence of an external electric field gradient in the liquid-crystal solvent is required and its magnitude is estimated. (12 refs.)

33.45B Zeeman and Stark effects

112764 Magnetic susceptibility anisotropy, molecular g values, and other molecular properties of cyclopropane as determined from rotational Zeeman studies of the cyclopropane- H^{35}Cl and cyclopropane- H^{15}N complexes. P.D.Aldrich, S.G.Kukolich, E.J.Campbell, W.G.Read (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5569-76 (24 Aug. 1983). A pulses, Fourier-transform microwave spectrometer has been used to observe the rotational Zeeman effect with the cyclopropane-HCl and cyclopropane-HCN complexes. The molecular g values and magnetic susceptibility anisotropies have been determined for the cyclopropane-HCl complex and have been used to obtain the molecular quadrupole moment, magnetic susceptibility tensor elements as well as the paramagnetic and diamagnetic contributions, and the second moment of the electronic charge distribution. Certain Zeeman parameters along with zero-field rotational constants have been obtained for cyclopropane- H^{15}N . The Zeeman constants for both complexes have then been used to extract various magnetic properties of cyclopropane. (59 refs.)

112765 The rotational Zeeman effect in the ArOCS van der Waals complex. J.A.Shea, W.G.Read, E.J.Campbell (Noyes Chem. Lab., Univ. of Illinois, Urbana, IL, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2559-68 (15 Sept. 1983). The rotational Zeeman effect has been measured in the weakly bound complex ArOCS. The study was carried out on a pulsed Fourier-transform microwave spectrometer employing a supersonic nozzle and a Fabry-Perot cavity. The following spectroscopic constants were obtained: $g_{aa} = -0.024\ 83$ (21), $2\chi_{aa} - \chi_{bb} - \chi_{cc} = 1.313(32) \times 10^{-9}$ MHz/G 2 , $g_{bb} = -0.00086(23)$, $2\chi_{bb} - \chi_{cc} - \chi_{aa} = -3.762(26) \times 10^{-9}$ MHz/G 2 , $g_{cc} = -0.00558(11)$. Projection equations are used to relate the magnetic properties of free OCS to those of the complex. An analysis of the force field as obtained from centrifugal distortion is used to determine an average structure for ArOCS and mean square amplitudes of the van der Waals motions. These are used to augment the projection analysis. The molecular quadrupole moment of ArOCS is calculated from the Zeeman parameters. With an estimated bulk magnetic susceptibility, diamagnetic susceptibilities and the second moments of electronic charge distribution are also calculated. (30 refs.)

112766 Theoretical calculation of the absorption and magnetic circular dichroism spectrum of a Jahn-Teller distorted excited state: the $1E'$ excited state of cyclopropane. W.Duch, G.A.Segal (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2951-63 (15 Sept. 1983). This paper reports the ab initio calculation of the absorption and magnetic circular dichroism spectrum of a Jahn-Teller distorted system, the $1E'$ (s) excited state of cyclopropane, interacting with the doubly degenerate ring stretching mode. The vibronic problem is treated in the adiabatic approximation. Good agreement is found with the observed vibronic spectrum and a distinctive behaviour is predicted for the MCD. (19 refs.)

33.45C Magnetic circular dichroism

112767 Theory of multiphoton magnetic circular dichroism: two identical photon case. S.H.Lin (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA), Y.Fujimura, M.Saito, T.Nakajima.

J. Phys. Chem. (USA), vol.87, no.15, p.2895-900 (21 July 1983). A theory of multiphoton magnetic circular dichroism (MCD) is developed for the two identical photon case. It is shown that, in the nonresonant intermediate state case, the transition probability of the two-photon MCD consists of A , B , and C terms as is well-known in the one-photon MCD. In the resonant case, another term which vanishes if both the initial and resonant electronic states are nondegenerate makes a contribution to the transition probability in addition to the A , B , and C terms. Expressions for those terms for the two-photon MCD of molecules are derived in the adiabatic approximation. Band shapes appearing in the two-photon MCD are discussed. Analytical expressions for the band shapes including the temperature effect have been derived in the displaced harmonic oscillator model. The expressions can be applied for both the weak and strong coupling cases. Model calculations of the band shapes are performed to demonstrate the effects of the potential displacement on the band shapes of the two-photon MCD. (12 refs.)

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

112768 Raman characteristics of the excited electronic state in the fluorescent band of molecules. P.P.Kircheva (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria).

Bulg. J. Phys. (Bulgaria), vol.10, no.3, p.309-22 (1983). Stimulated emission of molecules driven to the first excited electronic state and interacting with monochromatic light is discussed. An energy level diagram with 'up' and 'down' intermediate levels is used. The cases of weak and strong pumping waves are considered. The calculated amplification spectra are presented and qualitatively compared with the existing in the literature experimental data for stimulated emission of dye molecules. (16 refs.)

112769 A molecular beam study of the trapping-desorption of I_2 from a LiF (001) surface. J.B.Cross, J.B.Lurie (Chem. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.174-7 (2 Sept. 1983). Rotational, vibrational and translational Boltzmann distributions of I_2 desorbing from LiF (001) were measured using laser-induced fluorescence. The I_2 rotational temperature is lower than the surface temperature (T_S) at $T_S > 300K$ while the vibrational and translational temperatures are $\approx T_S$. An upper limit on the I_2 -LiF(001) potential well depth was found to be 0.45 ± 0.03 eV. (17 refs.)

112770 Dynamical study of twisted intramolecular charge transfer in *p*-dimethylaminobenzonitrile solutions. F.Heisel, J.A.Miche (Lab. de Phys. des Rayonnements et Electronique Nucleaire, Strasbourg, France).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.183-8 (2 Sept. 1983). To characterize the intramolecular charge-transfer process of DMABN, pico- and nano-second measurements in different polar solutions and at various temperatures were undertaken. Evidence of (i) time-dependent interconversion rates describing the formation of the charge-transfer state and (ii) fluorescence solvachromic effects is presented. (4 refs.)

112771 Argon ion laser excitation of supersonic seeded molecular beams of I_2 . F.J.Aoiz, M.M.Oprysko, R.B.Bernstein (Dept. of Chem., Columbia Univ., New York, NY, USA).

Chem. Phys. (Netherlands), vol.79, no.3, p.321-39 (15 Sept. 1983). Experiments on the laser excitation ($B \leftarrow X$) of seeded supersonic beams of I_2 by a CW argon-ion laser at 514.5 nm are reported. Measurements consisted of laser-induced fluorescence and I_2 beam attenuations and I_2 time-of-flight distributions as a function of carrier-gas pressure and nozzle temperature. From the laser-induced beam loss, the direct photodissociation cross section is found to be $(2.4 \pm 0.5) \times 10^{-19}$ cm². A simple model has been formulated to determine the fraction of molecules that are excited by the laser, utilizing the above data base and available spectroscopic data. From the laser power dependence of the fluorescence, the model also yields the magnitude of the hyperfine-averaged Einstein B coefficient, found to be $(4.9 \pm 1.0) \times 10^{16}$ erg⁻¹ cm² s⁻². The fractional excitation of fast, cold beams of I_2 is much greater than for slow or Maxwellian beams, and dependent (via the Doppler effect) upon the angle of intersection of the laser and molecular beams. (43 refs.)

112772 Fluorescence lifetime and collisional quenching of the predissociative NO $B^2\Pi$ ($v'=7$) state. K.Shibuya, F.Stühl (Phys. Chem. I, Ruhr Univ., Bochum, Germany).

Chem. Phys. (Netherlands), vol.79, no.3, p.367-81 (15 Sept. 1983). Fluorescence lifetimes of NO $B^2\Pi$ ($v'=7$) were measured in pure NO and in mixtures of NO and M ($M=O_2, N_2, H_2, Ar$, and He) using single vibronic level excitation by an ArF excimer laser ($\lambda=193$ nm). The zero-pressure lifetime was determined to be 0.33 ± 0.03 μ s. This value of the lifetime is about six times shorter than the radiative lifetime of the $B^2\Pi$ ($v'=7$) state (≈ 2 μ s). The quantum yield of the fluorescence is hence estimated to be ≈ 0.15 . Irradiation of NO by the ArF laser prepares highly excited rotational levels ($J'=22.5-33.5$) in the B ($v'=7$) state. These levels are evidently predissociated in accordance with the energetical dissociation limit which corresponds to $J' \approx 6.5$ for $B^2\Pi_{1/2}$ ($v'=7$) and to $J' \approx 3.5$ for $B^2\Pi_{3/2}$ ($v'=7$). (42 refs.)

112773 Theory of fluorescence depolarization by anisotropic Brownian rotations. R.Alicki, M.Alicka (Sektion Phys., Univ. Munchen, Munchen, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.835-7 (Aug. 1983). On the basis of a generalized diffusion equation for the rotational motion of an asymmetric rigid rotor a general expression for steady-state fluorescence depolarization has been obtained. (5 refs.)

112774 Fluorescence of trans-4-cyano-4'-dimethylaminostilbene; no evidence for a TICT state. H.Gruen, H.Gorner (Max-Planck-Inst. fur Strahlenchem., Mulheim, Germany).

Z. Naturforsch. Teil A (Germany), vol.38A, no.8, p.928-36 (Aug. 1983). The fluorescence properties of trans-4-cyano-4'-dimethylaminostilbene (trans-1) and a rigid analogue, in which the dimethylaminophenyl group is replaced by an indoline ring, trans-1-(4-cyanophenyl)-2-(5-[2,3-dihydro]N-methylindolyl)ethylene (trans-2) were studied in 20 solvents. The quantum yields of fluorescence (Φ_f) and of trans-cis photoisomerization (Φ_{isc}) as well as the fluorescence maximum ($\bar{\nu}_f$) and the bandwidth ($\Delta\bar{\nu}_f$) were examined. The activation energies (range: 3.5-7.8 kcal/mol) obtained from Φ_f and Φ_{isc} measurements are nearly the same for 1 and 2 in a given solvent Φ_f , $\bar{\nu}_f$ and $\Delta\bar{\nu}_f$ as a function of solvent polarity and temperature show similar trends for 1 and 2. No dual emission was observed for either of the cyanostilbenes. These findings indicate that a twisted intramolecular charge transfer (TICT) state is not involved in the relaxation process of the first excited trans single state (t^*). The main deactivation pathway of t^* competing with fluorescence in trans-cis photoisomerization by twisting about the C=C double bond in the first excited singlet state for both. (41 refs.)

112775 Radiationless transitions in linear polyenes. U.Dinur, B.Scharf (Dept. of Chem., Ben-Gurion Univ. of the Negev, Beer-Sheva, Israel).

J. Chem. Phys. (USA), vol.79, no.6, p.2600-8 (15 Sept. 1983). Electronic radiationless transitions in linear polyenes are discussed from a theoretical point of view. Only inplane relaxation is considered. It is concluded that for a given energy gap, the nonradiative decay rate is a decreasing function of the chain length. Model calculations of the nonradiative lifetime as a function of the polyene chain length are presented. For those cases where comparison with the experiment is possible (8 to 12 membered polyenes) agreement with the calculations is reasonable. The decrease in the rate of radiationless transitions with the increase in the molecular system is shown to have implications for biological systems, such as rhodopsin, that undergo a fast photochemical change. (28 refs.)

112776 Laser-induced fluorescence of PuF_6 in the $3^1G_4 \rightarrow 1^1G_4$ electronic band at room temperature. J.E.Barefield, II., W.W.Rice, J.J.Tice, R.T.Walters (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2621-5 (15 Sept. 1983). When PuF_6 is photoexcited at 797.3 nm, fluorescence is observed from the 1^1G_4 electronic energy level. The lifetime τ of the fluorescence signal varies with pressure. The lifetimes cover a range of 655 to 243 ns for a pressure range of 0.5 to 72 Torr. A linear Stern-Volmer relationship was obtained over the complete pressure range considered. An extrapolation to zero pressure yields an intercept of $\tau_0 = 663$ ns and a slope of 3.62×10^4 Torr⁻¹ s⁻¹. Fluorescence and excitation spectra are reported and are in good agreement with the previously reported absorption spectrum of PuF_6 . (9 refs.)

112777 Roles of the Rydberg transitions in fast excitation transfer studied in cyclohexane and *n*-heptane using synchrotron radiation. K.Kimura (Inst. of Phys. & Chem. Res., Wako Saitama, Japan), J.Hormes.

J. Chem. Phys. (USA), vol.79, no.6, p.2756-62 (15 Sept. 1983). Excitation spectra of PPO (2,5-diphenyl oxazole) in cyclohexane solution show peaks at 63000 and 78000 cm⁻¹, while those in *n*-heptane solution show a single peak near 66000 cm⁻¹. The 63000 cm⁻¹ peak for cyclohexane and 66000 cm⁻¹ peak for *n*-heptane are ascribed to excitation transfer at respective valence-band absorption peaks. An extra peak at 78000 cm⁻¹ for cyclohexane solution is tentatively ascribable to the Rydberg transitions and it is situated near the eighth peak of the Rydberg series. The expanded reaction radius is, therefore, estimated to be about 30 Å. Taking account of the Rydberg series can explain the known fact that excitation transfer in cyclohexane is extraordinarily fast compared with that in *n*-heptane. Kinetic analysis shows that these upper excited states at 63000 and 78000 cm⁻¹ of cyclohexane make direct excitation transfer, competing with relaxation to the lowest excited state at 49750 cm⁻¹. It is briefly discussed that the Rydberg series, which can be observed only in cyclic (or round) alkanes, may also be one of the key processes that explain molecular structural dependence observed in the excitation transfer and electron mobilities in alkanes. (24 refs.)

112778 Fluorescence quenching interactions of L(-)-tryptophan in dimethyl sulfoxide with trivalent lanthanides. V.Anantharaman, J.Chrysoschoos (Dept. of Chem., Univ. of Toledo, Toledo, OH, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.59-66 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Excited singlet-triplet crossing of tryptophan in dimethyl sulfoxide is enhanced in the presence of trivalent lanthanide ions, leading to fluorescence quenching and subsequent initial phosphorescence enhancement. The induced system crossing rate constant k_{isc}^{ind} ranges from 1.9×10^7 to 1.5×10^8 s⁻¹ at room temperature for the seven lanthanide ions used. A gradual fluorescence quenching accompanies the initial induced system crossing with a rate constant k_S^{ind} ranging from 3×10^8 to 1.4×10^{10} M⁻¹ s⁻¹. The value of k_S^{ind} is proportional to the spectral overlap between the fluorescence of tryptophan and the absorption of the lanthanides. Values of k_{isc}^{ind} and k_S^{ind} are correlated with several parameters of the lanthanides employed. (14 refs.)

112779 Phosphorescence quenching of L(-)-tryptophan in dimethyl sulfoxide at 77K by trivalent lanthanide ions. V.Anantharaman, J.Chrysoschoos (Dept. of Chem., Univ. of Toledo, Toledo, OH, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.67-72 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Quenching of the corrected phosphorescence emission of tryptophan in dimethyl sulfoxide by trivalent lanthanide ions Ln^{3+} can be interpreted in terms of a static model leading to triplet quenching constants k_Q^T ranging from 1.3×10^7 to 9.1×10^7 M⁻¹. The values of k_Q^T increase with increasing spectral overlap and J values of the ground state of the appropriate lanthanide ions. The phosphorescence lifetime of tryptophan is virtually independent of $[Ln^{3+}]$ and has a value of 6.15 ± 0.25 s, in agreement with the static model of triplet quenching. (10 refs.)

112780 Luminescence of divalent europium complexes with crown ethers, cryptands and polyethylene glycols. G.-Y.Adachi, K.Sorita, K.Kawata, K.Tomokiyo, J.Shiohara (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.81-7 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The luminescence properties of the divalent europium complexes with crown ethers, cryptands and polyethylene glycols were studied. The observed intensity of luminescence is generally reported. The most intense luminescence is produced by a methanolic solution of the 15-crown-5 complex with europium(II), the intensity of which is 600 times greater than that of a solution of $EuCl_2$ in methanol with the same europium(II) concentration. The enhancement of the emission intensity as a result of the formation of complexes with crown ethers can be attributed to 'insulation' of the europium(II) ion from close approach of the solvent molecules which would produce radiationless energy losses. (7 refs.)

112781 Laser-induced fluorescence of Pb_2 . H.Sontag, R.Weber (Fakultat fur Phys., Univ. Konstanz, Konstanz, Germany).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.75-81 (July 1983). Pb_2 , which occurs in lead vapor, was studied by the technique of laser-induced fluorescence using single-mode Ar-laser excitation. The fluorescence observed could be classified into the $F-X$ system. Ten progressions involving vibrational quantum numbers $v'=0..9$ and $v''=0..22$ were analyzed. Including collision-induced lines, rotational quantum numbers from $J=25$ to $J=300$ were observed. The vibrational constants and the numbering of the states had to be reassigned. For the first time rotational constants were determined for the Pb_2 molecule. The internuclear distances of $^{208}Pb_2$ in the F and X state are $r=3.079$ Å and $r_e=2.930$ Å, respectively. Using the constants derived RKR potentials and Franck-Condon factors were calculated, which confirmed the vibrational assignments and constants. (10 refs.)

112782 A well-resolved carbazole excimer emission from a conformationally pure polymer. L.L.Chapoy (Tech. Univ. of Denmark, Lyngby, Denmark), D.Biddle.

J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.8, p.621-5 (Aug. 1983). The authors present novel spectral evidence for an energetically well-resolved carbazole excimer emission spectrum for a polymer in solution. The polymer in question is an α -helical-forming poly(amino acid), (9-carbazolyl)-carboxyl-L-lysine (PKL), containing pendant carbazole groups and is both stereoisomerically and conformationally pure. The spectrum for PKL under consideration probably results from a few well-defined excimer states as dictated by nearest-neighbour carbazole interactions under the constant of the α -helix. The authors believe that this could have profound photobiological implications. (12 refs.)

112783 Applications of fluorescence from the second excited electronic level of rhodamine 6G. M.D.Galanin, Z.A.Chizhikova. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1440-4 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1010-15 (Dec. 1982). [received: Sept. 1983]

The authors discuss fluorescence from high-lying electronic states of organic compounds, and in particular the S_0-S_1 and S_2-S_0 transitions of rhodamine 6G and various other compounds. The use of S_2-S_0 fluorescence in picosecond measurements is discussed, along with nonlinearity in S_2-S_0 fluorescence and thermalisation-time estimation for a liquid solvent. Thermal quenching and S_2-S_0 fluorescence saturation in various solvents are also reviewed. (18 refs.)

112784 Spectroluminescence study of the behavior of organic molecules in a finely porous glass matrix. V.I.Zemskii, I.K.Meshkovskii, A.V.Sechkarev (Inst. of Precision Mech. & Optics, Leningrad, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1047-9 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1357-60 (Dec. 1982). [received: Sept. 1983]

The behavior of molecules introduced into a solid glass matrix is of great interest in connection with the wide-ranging possibilities for technical applications of the microcomposition materials obtained in this way. Important information can be obtained from a study of the luminescence spectra. The authors report the results of a study of the fluorescence spectra of molecules of 3-amino-N'-methyl-phthalimide (3-AMP) and rhodamine-6G in a finely porous glass matrix. (8 refs.)

33.65 PHOTOELECTRON SPECTRA

112785 Observation of X^1A_1 vinylidene by photoelectron spectroscopy of the $C_2H_2^-$ ion. S.M.Burnett, A.E.Stevens, C.S.Feigerle, W.C.Lineberger (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.124-8 (2 Sept. 1983). Photoelectron spectra of the vinylidene anion ($C_2H_2^-$) show vibrational structure in X^1A_1 vinylidene up to 12 kcal/mol above the vibrational ground state. Analysis yields an EA ($C_2H_2 X^1A_1$) of 0.47 ± 0.02 eV, and frequencies for the CC stretch and HCH bend. Absence of the 3B_2 state in the photoelectron spectra indicates the $^1A_1-^3B_2$ splitting in vinylidene is ≥ 1.7 eV. (34 refs.)

112786 Vibrational broadening in F 1s hole states and the $8a_{1g}$ valence orbital of XeF_6 structure of XeF_6 and heats of formation of unusual cations. D.J.Bristow, G.M.Bancroft (Dept. of Chem., Univ. of Western Ontario, London, Ontario, Canada).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5634-8 (24 Aug. 1983). The authors have recorded the F 1s X-ray photoelectron spectra of the rare gas fluorides (KrF_2 , XeF_2 , XeF_4 , and XeF_6), the fluoromethanes (CH_3F , CF_3H , and CF_4), and HF. The large range of F 1s line widths for these and other fluorinated compounds (1.2 to 2.6 eV) is due to vibrational broadening. Using the equivalent cores approximation to quantify this broadening, they show that there is a rather good correlation between the dissociation energy for the reaction: $XNe^+ \rightarrow X^+ + Ne$ ($X^+ = KrF^+$, XeF^+ , etc.) and the F 1s line width. Relative Lewis acidities toward Ne have been obtained from the dissociation energies or line widths, and heats of formation of the unusual cations (i.e. linear ClF_2^+ and T-shaped SF_3^+) are derived. The vibrational structure on the $8a_{1g}$ valence orbital of XeF_6 shows an average vibrational splitting of ~ 530 cm $^{-1}$. This splitting is considerably smaller than the ground-state value and suggests that the $8a_{1g}$ orbital is bonding rather than antibonding as previously suggested. This vibrational analysis, the authors' X α calculations, and the F 1s line width treatment all indicate that the very broad F 1s line width in XeF_6 is caused by vibrational broadening rather than inequivalent fluorines. (39 refs.)

33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

112787 The collision half-width for the $R(0)$ line of the ν_3 band of methane. H.C.Walker, Jr., W.J.Phillips (Sverdrup Technol., Arnold Air Force Station, TN, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.4729-33 (Sept. 1983). The collision half-width for the $R(0)$ absorption line of the ν_3 band of methane has been determined as a function of temperature with nitrogen and carbon dioxide as the broadening gases. The measurements were made in the temperature range from 300 to 1000K with broadening gas pressures in the range from 5 to 15 psi (absolute). Methane partial pressures sufficient to produce approximately 60% absorption at line center for each condition were used. The line spectrum was produced with a Laser Analytic LS-3 tunable diode laser spectrometer. A best-fit Voigt profile to the experimental line shape was used to determine the broadening which is characterized by the collisional or Lorentz half-width. (10 refs.)

112788 A theoretical study of the radiative lifetime of the $CH A^2\Delta$ state. M.Larsson (Res. Inst. of Phys., Stockholm, Sweden), E.M.Siegbahn.

J. Chem. Phys. (USA), vol.79, no.5, p.2270-7 (1 Sept. 1983). The complete active space (CASSCF) method has been used to generate wave functions for calculations of the $A^2\Delta-X^2\Pi$ transition moment. This transition provides an interesting test case for different ab initio methods since the experimental data for the A state radiative lifetime should be very accurate. The two most accurate recent experiments agree to within 1% of each other, with a value of 536 ns. The best earlier theoretical value is 397 ns. The authors calculations show an extremely slow convergence with basis sets and active spaces. A calculation with a basis set of more than quadruple zeta quality with two d and one f function on carbon and three p and one d function of hydrogen gave an error of 20% (446 ns compared to 536 ns) for the lifetime, even when a large active space of 5σ , 3π , and 1δ orbital was used. The authors best calculated value 525 ns finally agreed very well with the experimental value, and is consequently larger compared to the earlier theoretical value by more than 30%. (36 refs.)

112789 Study of the 1750 Å mercury absorption band. Determination of the excited interaction potential and of the oscillator strength related to this band. N.Bras, C.Bousquet (Dept. de Recherches Phys., Univ. Pierre et Marie Curie, Paris, France).

J. Phys. B (GB), vol.16, no.18, p.3383-92 (28 Sept. 1983). The 1750 Å mercury absorption band is analysed. The temperature dependence of the profile is studied and interpreted in the framework of the quasi-static theory. The energy curve of the ground state of Hg_2 being available, the upper-state potential curve as well as the oscillator strength of the transition are derived between about 3.2 and 3.6 Å. Additional information about the upper-state energy curve is drawn from the analysis of the vibrational structure of the band. In view of the results obtained it seems reasonable to attribute this 1750 Å absorption band to transitions ending at the $^3\Sigma_u^+$ Rydberg state arising from $Hg(^7S_1) + Hg(6^1S_0)$. (12 refs.)

112790 The measurement of pressure-induced shifts and widths of the $(J,K)=(3,3)$ inversion line of NH_3 at various temperatures. I.R.Dagg, P.S.Atherton, R.W.Parsons (Dept. of Phys., Univ. of Queensland, Brisbane, Queensland, Australia).

J. Mol. Spectrosc. (USA), vol.100, no.1, p.134-42 (July 1983). Line-shift and line-width parameters for the $(J,K)=(3,3)$ inversion line of NH_3 have been measured at various temperatures in the range 213 to 373K, and the results are compared with those predicted theoretically. The line-width parameter decreases with increasing temperature, in qualitative agreement with the theory, but the predicted widths are between 10 and 20% too large. The line-shift parameter is positive, so that the center frequency of the spectral line increases with increasing pressure, and the parameter decreases with increasing temperature. This is also in qualitative agreement with the theory but the predicted results are too large by factors of between 3.8 and 7.2. In addition to the experimental results, details are also given of a number of improvements which have been made to the spectrometer which had been used for earlier shift measurements. (14 refs.)

112791 Zero-phonon lines in spectra of large molecules. K.K.Rebane. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1346-61 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.906-22 (Dec. 1982). [received: Sept. 1983]

The article is devoted to a basic aspect of the problem of inhomogeneous broadening of a zero-phonon line, namely, the role of the specific structure of a homogeneous low-temperature spectrum of an impurity molecule. The author considers why and precisely how the simultaneous presence in a homogeneous spectrum of narrow intense zero-phonon lines and wide phonon wings causes the peculiar and clear manifestations of the inhomogeneous structure of the impurity-molecules-matrix system in the overall spectrum of a large number of impurities. (46 refs.)

112792 Theory of the radiative lifetime of the 3B_1 state of SO_2 . P.Phillips, E.R.Davidson (Dept. of Chem., Univ. of Washington, Seattle, WA, USA).

J. Comput. Chem. (USA), vol.4, no.3, p.337-44 (Fall 1983). Interchange and many-body perturbation theory are applied to the calculation of the radiative lifetime of the 3B_1 state of SO_2 . The radiative lifetime of 3B_1 SO_2 is predicted to be 7.6 msec, in excellent agreement with the experimental collision-free phosphorescence lifetime. As a separate calculation, interchange perturbation theory is used to determine the radiative lifetime of the 1A_1 state of CH_2 . (24 refs.)

112793 Parameters of a stochastic oscillator describing a hydrogen-bonded system in a cryosolution. A.V.Bobrov, N.N.Gadzhieva, Ya.M.Kimel'fel'd (Inst. of Spectroscopy, Acad. of Sci., Moscow, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.620-6 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.675-81 (Nov.-Dec. 1982). [received: Sept. 1983]

The Pimentel-Huggins empirical linear relationship (1956) between the shift $\Delta\nu$ and the half-width $\nu_{1/2}$ ($\nu_{1/2} \approx 0.7\Delta\nu$) is isolated to varying extents for all complexes that have been examined in cryosolutions: The authors have examined the shapes of the $\nu_s(X-H)$ bands in cryosolutions within the framework of the Robertson-Yarwood model (1978). (17 refs.)

112794 Permutational analysis and tunnelling effects in XeF_6 . J.Brocas, C.Rusu (Univ. Libre de Bruxelles, Bruxelles, Belgium).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.257-63. The modes of rearrangements and the possible Longuet-Higgins groups of XeF_6 have been derived assuming a D_{3d} static or averaged symmetry. Within the same model, it is shown that the nonrigid multiplet line-shape of BPR-3, 6 mechanism is distinct from the line-shape of the other mechanisms generating the same Longuet-Higgins group. It has not been possible to obtain this

pe of discrimination between BPR-6, transverse diagonal or Bailar twists, id turnstile pseudorotation; they all generate the same Longuet-Higgins group and give rise to identical splitting scheme and statistical weights. (17 fs.)

33.80 PHOTON INTERACTIONS WITH MOLECULES

112795 Theoretical Compton profile anisotropies in molecules and solids. IX. Chemical bonding and 0-90 anisotropies in the first-row diatomic hydrides AH. B.M.Pettitt, R.L.Matcha (Dept. of Chem., Univ. of Houston, Houston, TX, USA), B.I.Ramirez. *J. Chem. Phys. (USA)*, vol.79, no.6, p.2913-17 (15 Sept. 1983).

An analysis of the parallel-perpendicular Compton profile anisotropies in the first-row diatomic hydrides is presented. Both the total and molecular orbital anisotropies present trends that may be related to the nature of the chemical bonding in the molecules. (11 refs.)

112796 Improved calculations on the outer-valence Auger spectrum of F_2 . C.-M.Liegender (Inst. fur Theoretische Phys., Tech. Univ. Berlin, Berlin, Germany). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2924-7 (15 Sept. 1983).

The outer-valence Auger spectrum of F_2 has been calculated by methods of many-body perturbation theory. The results have been compared with the recently recorded experimental spectrum and some partially new assignments have been proposed. (14 refs.)

112797 Photoionisation and molecular structure. A.Palma (Investigacion Basica de Procesos, Inst. Mexicano del Petroleo, Mexico City, Mexico). *Rev. Mex. Fis. (Mexico)*, vol.29, no.3, p.387-99 (May 1983). In Spanish. [received: Sept. 1983]

A presentation is given of the theoretical work on photoionization and molecular structure carried out by the author and coworkers. The implications of the photoionization process on the molecular geometry are emphasized. In particular, the ionization effect on deep orbitals is considered and it is shown that, contrary to traditional thinking, these orbitals have relevant effects on the molecular geometry. The problem of calculating photoionization relative intensities for the full spectrum is also considered, and the results of the present model are compared with experimental and other theoretical results. 33.80G Diffuse spectra; predissociation, photodissociation

112798 The A-X transition in Cr_2 : predissociation, isotope effects, and the 1-1 sequence band. S.J.Riley, E.K.Parks, L.G.Pobo, S.Wexler (Chem. Div., Argonne Nat. Lab., Argonne, IL, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2577-82 (15 Sept. 1983).

Two-color resonance-enhanced ionization spectroscopy with mass analysis is performed on beams of Cr_2 produced by laser vaporization and isentropic expansion cooling. For the A-X 0-0 band near 459.6 nm an extensive rotational spectrum is observed and its intensity profile is found to have a systematic modulation with J. This modulation, and its surprisingly strong dependence on isotopic composition, are interpreted in terms of a two-step predissociation of the A state and suggest a potentially important new procedure for isotope enrichment in metal systems. An additional resonant feature is found ~ 1 nm to the red of the origin band and is assigned to the 1-1 sequence band. (20 refs.)

112799 State-to-state dissociation dynamics in CF_3NO . R.D.Bower, R.W.Jones, P.L.Houston (Dept. of Chem., Cornell Univ., Ithaca, NY, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2799-807 (15 Sept. 1983).

The state-to-state dissociation dynamics of CF_3NO have been investigated by exciting the parent compound in a supersonic jet expansion with one tunable laser and monitoring the state distribution of the NO fragment by one- or two-photon laser-induced fluorescence using a second tunable laser. At the lowest levels of excitation, CF_3NO dissociates to give an NO distribution which is consistent with a statistical distribution of energy in the products. As more highly excited vibronic states of S_1 are selected, the product distribution begins to show signs of nonstatistical behavior, although the deviations are small. The appearance time of the NO decreases nearly monotonically with increasing energy above the S_1 origin and is equal to the fluorescence lifetime of the CF_3NO^* to within experimental error. It is likely that both the appearance time of the NO and the fluorescence lifetime of the CF_3NO^* measure the rate of internal conversion from S_1 to highly excited vibrational levels of S_0 , which then dissociate in a nearly statistical fashion on the S_0 surface. The barrier to dissociation of the CF_3-NO bond is 39.6 ± 0.23 kcal/mol. (26 refs.)

112800 Vibrational predissociation of H_2 , D_2 , and HD-Ar van der Waals molecules. J.M.Hutson, C.J.Ashton, R.J.Le Roy (Guelph-Waterloo Centre, Univ. of Waterloo, Waterloo, Ontario, Canada). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2713-20 (21 July 1983).

Accurate close-coupling calculations are performed for vibrationally predissociating states of H_2 -Ar, D_2 -Ar, and HD-Ar, using the best potential energy surface available. All the states examined have very small widths ($\Gamma \ll 10^{-6}$ cm $^{-1}$, corresponding to lifetimes > 20 μ s). There is a pronounced tendency for predissociation to yield rotationally hot diatomic molecules, even for the H_2 -Ar and D_2 -Ar complexes where the present potential has no anisotropic terms of higher order than $P_2(\cos \theta)$. This near-resonant effect is particularly strong for HD-Ar, where all Legendre terms are present in the potential; in this case, about 50% of the HD products are formed in the highest two accessible rotational levels. There is some evidence for a rotational rainbow effect in the product rotational state distributions. Perturbation theory calculations which attempt to reproduce the accurate calculations are also reported. They successfully model the qualitative features of the close-coupling results, but are not quantitatively accurate even for these weakly coupled systems. It appears that this inadequacy is due to the need for a very accurate representation of the bound state wave function and to the neglect of important couplings between the different open channels. This conclusion is supported by the observation that very large basis sets are required to obtain convergence of the close-coupling calculations. (22 refs.)

33.80K Multiphoton processes

112801 On the vibronic treatment of two photon absorption in polyatomic molecules. P.P.Kiricheva, S.D.Simeonov (Inst. of Solid State Phys., Bulgarian Acad. of Sci., Sofia, Bulgaria). *Bulg. J. Phys. (Bulgaria)*, vol.10, no.3, p.297-309 (1983).

A general expression for nonlinear susceptibility of two-photon absorption by a multilevel system is applied in the case of polyatomic molecules in conditions of one-photon resonance. On the basis of a known model for the vibronic states, it is shown what kind of information can be given by the calculated spectra when they fit with the experimental data. (20 refs.)

112802 Ultraviolet two-photon spectroscopy of benzene: a new gerade Rydberg series and evidence for the 1^1E_{2g} valence state. R.L.Whetten, Ke-Jian Fu, E.R.Grant (Dept. of Chem., Cornell Univ., Ithaca, NY, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2626-40 (15 Sept. 1983).

In the first application of continuously tunable ultraviolet two-photon absorption spectroscopy to a study of the higher excited states of a polyatomic molecule, the authors obtained the two-photon absorption spectrum of jet-cooled benzene in the energy region from 55000 to 75000 cm $^{-1}$. The strongest features of this spectrum, seen as two-photon resonance structure in three-photon ionization, are assigned to members of a new Rydberg series. Vibronic elements of these Rydberg states show evidence of dynamical effects associated with a Jahn-Teller instability in the $^2E_{1g}$ ionic core toward which the series converges. Notably, the magnitude of vibronic coupling terms in these states appears quite comparable to that present in $C_6H_6^+$ and the sym-halobenzene cation ground states, while differing significantly from theoretical calculations predicting ν_8 (ring stretch) as the major distorting mode. In addition, we observe two other new band systems: the first, with an origin at 60800 cm $^{-1}$, has vibronic structure, isotope shifts, and dramatically increased diffuseness upon deuteration, which taken together suggest its

assignment as a highly valenized 3d Rydberg state or a degenerate valence state, most likely the lower of the two 1E_g states predicted by molecular orbital theory. The second, lying in the 55000-58000 cm^{-1} region, can be at least partially assigned to the two-photon forbidden $3p_{xy}$ Rydberg states. (65 refs.)

112803 Bound-water in biomolecules: a Monte Carlo simulation of the bifurcated hydrogen bond in violic acid monohydrate. S.Mascarenhas, J.N.Onuchic (Inst. de Fisica e Quimica de Sao Carlos, Univ. de Sao Paulo, Sao Carlos, Brazil).

An. Acad. Bras. Cienc. (Brazil), vol.55, no.2, p.165-72 (June 1983).

A Monte Carlo simulation is obtained for the well established case of the bifurcated hydrogen bond of the water molecule in violic acid monohydrate. This is done by the use of a multipole interaction potential for water in the field of the charges of the violic acid as given by a CNDO calculation. To these were added Lennard Jones potentials for all centers involved. All four crystallographic equivalent waters in the unit cell are allowed to move and rotate their dipole and quadrupole moments allowed to change in response to changes in local field during the interactive procedure for energy minimization. The final average position of the waters and their RMS motion agrees well with X-ray and neutron results indicating that the bifurcated hydrogen bond proposed for this structure is an energetically stable configuration. (15 refs.)

112804 On the use of a MO polarized basis for the analysis of the interaction energy in molecular interactions: application to amine complexes. R.Bonaccorsi, P.Palla (Istituto di Chimica Quantistica ed Energetica Molecolare CNR, Pisa, Italy), R.Cimiraglia, J.Tomasi.

Int. J. Quantum Chem. (USA), vol.24, no.3, p.307-16 (Sept. 1983).

A variant of the interaction energy decomposition scheme proposed by Morokuma (1977) which gives more emphasis to polarized MOs is presented and tested on complexes of amines with Li^+ , BH_3 , and SO_2 . A more systematic utilization of polarized MOs (i.e. of orbitals of the interacting molecules computed with the SCF formalism in the Coulombic field of the other molecular components of the system) is adopted, and the connection of this decomposition of the supermolecule interaction energy with perturbation approaches utilizing such polarized MOs is discussed. (21 refs.)

112805 Molecular constants of vanadium oxytrihalides. A.Natarajan, S.Somasundaram (Dept. of Phys., Madras Univ. Autonomous P.G. Centre, Tiruchirappalli, India).

Indian J. Phys. Part B, vol.57B, no.3, p.234-40 (June 1983).

The potential energy constants of vanadium oxytrihalides VOX_3 ($\text{X}=\text{F}$, Cl , Br) in general valence force field have been evaluated using the new procedure involving kinetic constants. Using this force field, the other molecular constants viz. mean square amplitudes of vibration, generalised mean square amplitudes, shrinkage constants, Coriolis coupling coefficients and centrifugal distortion constants have also been estimated. (16 refs.)

112806 Expectation values for Morse oscillators. R.H.Tipping (Air Force Geophys. Lab., Hanscom AFB, MA, USA), J.F.Ogilvie.

J. Chem. Phys. (USA), vol.79, no.6, p.2537-40 (15 Sept. 1983).

Several exact recursion relations for expectation values of different operators are derived for the Morse potential using the hypervirial and Hellmann-Feynman theorems. These results enable one to express the expectation values of other useful operators as series expansions in terms of the dimensionless anharmonicity parameter $\omega_e X_e/\omega_e$. The present results, obtained without explicit use of the eigenfunctions, are compared with similar results derived by other techniques, and it is illustrated how accurate values can be obtained with very little computational effort. (26 refs.)

112807 Walking on potential energy surfaces. J.Simons, P.Jorgensen, H.Taylor, J.Ozment (Chem. Dept., Univ. of Utah, Salt Lake City, UT, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2745-53 (21 July 1983).

By combining a local quadratic approximation to the potential energy surface with the concept of a trust radius within which this quadratic approximation is accurate, and a scaling of one active coordinate, the authors have developed an automated surface walking algorithm. This algorithm allows one to walk from geometries characteristic of equilibrium molecular structures, uphill along stream beds, through transition-state geometries, and onward to product-molecule equilibrium geometries. The method has been applied to model and ab initio test cases with encouraging results. The success of using the algorithm in connection with approximate Hessian matrices formed via so-called update techniques, which require only local force information, is especially encouraging in light of the high cost of ab initio analytical evaluation of the Hessian. (17 refs.)

112808 A new two-body water-water potential. E.Clementi, P.Habitz (IBM Corp., Poughkeepsie, NY, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2815-20 (21 July 1983).

The potential energies for the water dimer in various geometrical configurations have been calculated with the direct configuration interaction method, including all single and double excitations out of the Hartree-Fock reference. The basis set includes two d sets on the oxygen atom and describes the experimental dipole moment within 0.5%. The authors selected 169 geometries to scan the minimum and repulsive area of the potential surface. The results match the experimental minimum geometry and energy for the dimer. Comparison with previous work, Matsuoka et al. (1976), show appreciable deriva-

tions in the repulsive area. The authors have fitted the quantum mechanical result and calculated the second virial coefficient, which is, unfortunately, a factor of 2 off the experimental values. (31 refs.)

112809 Group theory of non-rigid molecules and its applications. K.Balasubramanian (Dept. of Chem. & Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Symmetries and Properties of Non-Rigid Molecules. A Comprehensive Survey. Proceedings of an International Symposium, Paris, France, 1-7 July 1983 (Amsterdam, Netherlands: Elsevier 1983), p.149-68. The use of generalized wreath product groups as representations of symmetry groups of non-rigid molecules is considered. Generating function techniques are outlined for nuclear spin statistics and character tables of the symmetry groups of non-rigid molecules. Several applications of non-rigid molecular group theory to NMR spectroscopy, rovibronic splitting and nuclear spin statistics of non-rigid molecules, molecular beam deflection and electric resonance experiments weakly-bound van-der Waals complexes, isomerization processes, configuration interaction calculations and the symmetry of crystals with structural distortions are described. 34.50 INELASTIC SCATTERING OF ATOMS AND MOLECULES

112810 Relativistic long-range interactions between H, He and Li atoms. S.I.Easa (Dept. of Phys., Coll. of Education, Basrah Univ., Basrah, Iraq), G.C.Shukla.

Indian J. Phys. Part B, vol.57B, no.3, p.225-8 (June 1983).

Relativistic long-range interactions between H, He and Li atoms have been worked out by using variational calculations of dipole polarizabilities of these atoms. The results are in harmony with earlier works. (7 refs.)

112811 Total scattering cross sections for the helium-argon system at low relative velocities. R.W.York, W.L.Taylor, P.T.Pickett (Monsanto Res. Corp., Miamisburg, OH, USA).

J. Chem. Phys. (USA), vol.79, no.6, p.2831-8 (15 Sept. 1983).

Absolute total cross sections for He-Ar were measured in the relative velocity range of $\sim 800\text{-}2000$ m/s by passing a supersonic nozzle beam through a cell containing the target gas. The beam attenuation was determined by passing the unscattered beam particles into a quadrupole detector. The absolute number density of target gas particles in the target cell was obtained by a calibrated-flow method of introducing gas into the cell during an experiment. A correction was applied for the angular resolution of the apparatus. The average experimental uncertainty was estimated to be $\sim 3\%$ to 3.5% . The present results, as well as other available data, were deconvoluted in a two-step process to yield Q^0 and Q^1 , the first and second approximations to the total cross section, as a function of the relative velocity. The composite results of all experimental data were compared to seven interatomic potentials and the Hartree-Fock-dispersion (HFD) potential represented the data best. (31 refs.)

112812 Influence of the rotational energy of the molecular perturber on the $\text{Rb}(5P)\text{-H}_2, \text{D}_2$ fine structure changing collisions. J.Cuvellier, J.M.Mestdagh, M.Ferray, P.de Pujol (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).

J. Chem. Phys. (USA), vol.79, no.6, p.2848-53 (15 Sept. 1983).

A crossed beam apparatus has been used to study the $\text{Rb}(5P_{1/2} \rightarrow 5P_{3/2})$ fine-structure-changing (FSC) transitions induced by D_2 and H_2 molecules. The rotational temperature of the molecular perturber and the relative energy E_R of the colliding atom-molecule pair were varied independently. The observed FSC cross section for H_2 remains almost unchanged as the rotational temperature is varied. On the contrary, the rotational temperature of D_2 results, in some cases, in a rather distinct variation of the FSC cross section; this is most pronounced of $E_R \sim 0.08$ eV and $T_{\text{rot}}(\text{D}_2) < 200\text{K}$. Reference is made to the theoretical model of Hickman (1982); it accounts well for the general trend in the cross section measured with H_2 . The results

for D_2 -Rb collisions imply that the various rotational levels of D_2 do not seem to contribute equally to the observed FSC cross sections. This work supports the assumption that for D_2 molecules in the rotational level $J=2$ (and probably also $J=3$), the FSC cross section is larger than for D_2 in its other rotational levels. (13 refs.)

112813 Theoretical studies of van der Waals dimer depletion mechanisms in free jet expansions: the Ar_2+X ($X=CO_2$, CO , N_2) systems. R. Viswanathan, L.M. Raff, D.L. Thompson (Dept. of Chem., Oklahoma State Univ., Stillwater, OK, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2857-68 (15 Sept. 1983).

Collisional energy transfer, exchange, and complex formation mechanisms for Ar_2 dimer depletion in free jet expansions have been investigated using quasi-classical trajectory methods on several different potential-energy surfaces. Computed Ar_2 dissociation cross sections show that $V \rightarrow V$ energy transfer is an unimportant mechanistic pathway for Ar_2 dissociation in collisions with CO_2 , N_2 , and CO . An $R \rightarrow V$ energy transfer pathway is found to be important at translational energies of 0.03 eV. However, there is very little difference among the results obtained for CO_2 , N_2 , and CO . At higher translational energies, around 0.10 eV, the importance of an $R \rightarrow V$ energy transfer mechanism in Ar_2 dissociation decreases. The results are found to be insensitive to moderate variations in the pairwise LJ(12,6) potential parameters. Three-body potential terms are shown to be of negligible importance. Rate coefficients for collisional dissociation, exchange, and complex formation have been computed for (CO_2, Ar_2) and (N_2, Ar_2) systems under conditions that approximate those existing in the experiments reported by Yamahita et al. [*J. Chem. Phys.* 75, 5355 (1981)]. For the CO_2 system, collisional dissociation is the major mechanistic pathway for Ar_2 depletion. Exchange plays only a minor role. Complex formation does not occur. For the N_2 system, collisional dissociation predominates for a rotational temperature equal to 298K. At lower rotational temperatures, exchange becomes the major process. Complex formation does not occur. Yield computed from a simple pseudo-first-order rate model are found to be in good accord with the experimental data for most systems. The exceptions are (C_2H_4, Ar_2) when the mole fraction of C_2H_4 is 0.10 or greater, and the $[C_4H_6, (CO_2)_2]$ system. (18 refs.)

112814 Inelastic differential and integral cross sections for $^{2S+1}\Sigma$ linear molecule- 1S atom scattering: the use of Hund's case (b) representation. G.C. Corey, F.R. McCourt (Dept. of Chem., Univ. of Waterloo, Waterloo, Ontario, Canada).

J. Phys. Chem. (USA), vol.87, no.15, p.2723-30 (21 July 1983). Exact close-coupled scattering equations are established for multiplet- Σ molecule-structureless atom collisions by using a Hund's case (b) coupling scheme for the description of the paramagnetic molecule. Coupled-states and infinite-order sudden approximation expressions are presented for T matrices and for differential and integral cross sections. The importance of transforming to a spin-free total- J basis is emphasized, especially its eventual usefulness in reducing the computing time that will be required for the solution of paramagnetic scattering problems. The result of a lack of J -state resolution in beam-scattering experiments is discussed and it is shown that, in such a case, formulas originally obtained for diamagnetic molecule-atom scattering apply. (29 refs.)

112815 Interaction of hydrogen atoms with polyatomic molecules studied by means of scattering experiments and hybrid Hartree-Fock plus damped dispersion calculations. G.O. Este, D.G. Knight, G. Scoles, U. Valbusa (Centre for Molecular Beams & Laser Chem., Univ. of Waterloo, Waterloo, Ontario, Canada), F. Grein.

J. Phys. Chem. (USA), vol.87, no.15, p.2772-80 (21 July 1983). Total differential collision cross sections for the scattering of H atoms from C_2H_6 , C_3H_8 , C_2H_2 , CO_2 , and O_2 have been measured and information on the spherical and nonspherical parts of the interaction potential extracted by means of scattering calculations which make use of the infinite-order sudden (IOS) approximation. The interactions of three other systems, $H+Ar$, $H+CH_4$, and $H+CO$, previously measured in the authors' laboratory have been calculated by means of hybrid Hartree-Fock plus damped dispersion (HFD) energy calculation and found to be in good agreement with the 'experimental' potentials. A model is then constructed to derive the main features of the interaction of H atoms with the higher hydrocarbons from the knowledge of the $H+CH_4$ interaction. The predictions of this model are found to be in excellent agreement with the experimental parameters for both the spherical and nonspherical parts of the potentials. (26 refs.)

Kinetic study of $Ca(4^3P_1)$ by time-resolved emission, $4^3P_1 \rightarrow 4^1S_0 + h\nu$ ($\lambda = 657.3$ nm), following dye-laser excitation: spontaneous emission, diffusion and collisional quenching See Entry 112681

Dissociation of Cn^+ into atomic excited states after acceleration in a tandem accelerator See Entry 115545

34.50E Rotational and vibrational energy transfer

112816 Vibrational energy relaxation of highly compressed gaseous H_2 and N_2 . M. Chatelet, J. Kieffer, B. Oksengorn (Lab. des Interactions Moléculaires et des Hautes Pressions, Univ. Paris-Nord, Villetaneuse, France).

Chem. Phys. (Netherlands), vol.79, no.3, p.413-29 (15 Sept. 1983). The authors have measured the vibrational energy relaxation time of dense gaseous hydrogen at 400K up to 250 MPa and of nitrogen at 293K up to 290 MPa. Following a short theoretical overview, the experimental results are analysed in terms of two different isolated binary collision (IBC) models. Qualitative agreement is found with the Gale and Delalande (1978) model, but the hard-sphere diameters deduced from the fit show a large discrepancy from theoretical predictions. This deviation seems to question the IBC assumption in the high-density domain. The comparison of the vibrational energy relaxation time with the self-diffusion coefficient, as suggested by Zwanzig (1961), gives further support to this view. (57 refs.)

112817 Optogalvanic effect study of vibrational relaxation in CO_2 laser process. F.O. Shimizu, K. Sasaki, K. Ueda (Dept. of Phys., Sophia Univ., Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1144-51 (July 1983). The amplitude and phase retardation of the optogalvanic signal in a CO_2 - N_2 -He laser plasma irradiated by a 10.6 μm CO_2 laser were measured under various experimental conditions. It is shown that the mechanism of the optogalvanic effect is related to the vibrational relaxation processes of the laser levels. The collisional rate constant relevant to the upper laser level (001) is determined as $(2.6 \pm 0.5) \times 10^2 / \text{Torr.s}$ at 300K. Good agreement is obtained between the present value and the value previously obtained by the infrared pulse gain method. A new model for the optogalvanic effect is proposed, taking three relaxation processes into consideration. The dependence of the optogalvanic effect on the pressure and modulation frequency is calculated using this method and a reasonable set of parameters, and shows good agreement with the observations. (30 refs.)

112818 Application of scaling theory to vibrational relaxation in linear anharmonic triatomic molecules. D.C. Clary (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England), A.E. DePristo.

J. Chem. Phys. (USA), vol.79, no.5, p.2206-11 (1 Sept. 1983). The energy-corrected-sudden (ECS) scaling theory is extended to vibrational relaxation in the collisions of anharmonic linear triatomic molecules with atoms. Application is made to the collisions of He atoms with $^{12}C^{16}O_2$, $^{14}C^{16}O_2$, and $^{12}C^{18}O_2$. By combining the rate constants for the (01^0-00^0) transitions, calculated using the vibrational close-coupling rotational infinite-order-sudden (VCC-IOS) method, with the ECS scaling theory, the authors predict rate constants for the transitions (10^0-01^0) , (02^0-01^0) , and (02^0-01^0) . These agree very well with the rate constants computed directly using the VCC-IOS technique. This comparison presents a particularly severe test of the accuracy of the ECS scaling theory for anharmonic polyatomics since Fermi resonance effects are large for the 10^0 and 02^0 levels in CO_2 . (26 refs.)

112819 Temperature dependence of near-resonant vibrational energy transfer between CO_2 and deuterated methanes. C. Manzanarez, J. Carrazza (Dept. de Quimica, Univ. Simon Bolivar, Caracas, Venezuela).

J. Chem. Phys. (USA), vol.79, no.5, p.2212-20 (1 Sept. 1983). Vibrational deactivation of $CO_2(00^1)$ by CD_4 , CHD_3 , CH_2D_2 and CH_3D has been studied using the laser fluorescence method. Rates are determined as a function of temperature in the range 220-300K. The rate constants increase as the temperature decreases for all the systems studied. The deactivation of $CO_2(00^1)$ correlates linearly with the number of stretching modes between the 2109 and 2263 cm^{-1} region of CH_nD_{4-n} ($n=0-4$) molecules which, in turn, correlates with the number of deuterium atoms in the collision partner. The linear correlation occurs at all the temperatures studied. This result is interpreted as a near-resonant vibrational-rotational energy transfer process in which two vibrational quantum numbers change as the energy is shared between the collision partners. The rotational distribution of population of each CH_nD_{4-n} molecule is calculated and compared with the rotational distribution of the initially excited CO_2 molecule. Sharma-Brau probabilities are calculated and compared with experimental probabilities. These calculated probabilities include average over the distribution of velocities, impact parameter, and rotational distributions. Experimental and calculated results indicate the effect of attractive forces in the energy transfer process and the importance of the rotational transitions decreasing the ΔE released to translational motion of the collision pair. (29 refs.)

112820 Collisional coupling and relaxation of $N_2(B^3\Pi_g)$ and $N_2(W^3\Delta_u)$ vibrational levels in Ar and Ne. N. Sadeghi (Lab. de Spectrometric Phys., Univ. de Grenoble, Saint-Martin d'Heres, France), D.W. Setser.

J. Chem. Phys. (USA), vol.79, no.6, p.2710-26 (15 Sept. 1983). Laser excitation from $N_2(A^3\Sigma_u^+, v=0-6)$ in Ne and Ar carrier gas in a flowing afterglow apparatus has been used to prepare $N_2(B^3\Pi_g)$ molecules in individual levels from $v=3-10$. The subsequent $N_2(B-A)$ fluorescence intensity was observed to study the coupling and relaxation kinetics of $N_2(B^3\Pi_g, v=2-10)$. The decay curves from each level show double (or higher) exponential relaxation. The first component is assigned as primarily the rapid coupling of the $N_2(B^3\Pi_g, v)$ and $N_2(W^3\Delta_u, v$ or $v+1)$ levels, however, the $N_2(B^3\Sigma_u^-, v-4)$ levels also may be involved for $N_2(B, v \geq 5)$. The slowest decay component represents the subsequent relaxation of the coupled levels. The combination of the two steps is equivalent to apparent stepwise vibrational relaxation of $N_2(B^3\Pi_g, v)$, such relaxation occurs even at low Ar pressures because of the large rate constants and long radiative lifetimes of $N_2(B)$ and $N_2(W)$. The coupling pattern between $N_2(B)$ and $N_2(W)$ is analyzed, and rate constants are assigned to elementary steps in the relaxation sequence and the scheme is evaluated. From the analysis of the slow decay components in argon, estimates (20-90 μs) are obtained for the radiative lifetimes for the reservoir levels, which are assigned as $N_2(W^3\Delta_u, v)$ for $N_2(B, v \leq 4)$ and $N_2(W^3\Delta_u, v$ or $v+1)$ levels plus $N_2(B^3\Sigma_u^-, v-4)$ levels, for some cases, for $N_2(B, v \geq 5)$. (28 refs.)

112821 Vibrational relaxation and vibrational predissociation in DCI gas.

J. Chesnoy (Lab. d'Optique Quantique, Ecole Polytech., Palaiseau, France).

J. Chem. Phys. (USA), vol.79, no.6, p.2793-8 (15 Sept. 1983). The vibrational relaxation lifetime of compressed deuterium chloride is measured at room temperature as a function of density using time resolved laser induced fluorescence. The results, showing a deviation from the simple gas behavior, are interpreted as giving evidence of the role played by vibrational predissociation of dimers in vibrational relaxation, according to recent theories of vibrational predissociation. The lifetime measurement of low density deuterium chloride, obtained between -95 and $+55^\circ C$ is first described and the results are quantitatively interpreted and compared to HCl gas. (32 refs.)

112822 Translational temperature dependence of mode-to-mode vibrational energy flow in $^{13}B_{30}$ naphthalene induced by low energy collisions with Ar. D.B. Moss, S.H. Kable, A.E.W. Knight (School of Sci., Griffith Univ., Brisbane, Queensland, Australia).

J. Chem. Phys. (USA), vol.79, no.6, p.2869-80 (15 Sept. 1983). Mode-to-mode vibrational energy flow from the $8^1(b_{1g})$ level in the $^{13}B_{30}$ state of naphthalene ($C_{10}H_8$) has been mapped in the energy regime $\epsilon_{vib} \leq 800$ cm^{-1} . Vibrational state changes are induced by low energy collisions with the carrier gas Ar in the warm to cool regions of a supersonic expansion. The pattern of energy transfer is estimated from time-resolved dispersed fluorescence spectra obtained following laser excitation of the absorption transition 8_0^1 . Propensities for particular transfer channels are found to be in qualitative accord with expectations based on studies of single-ring aromatics such as benzene and aniline. One-quantum changes are preferred over two-quantum changes and an energy gap law is evident. The competition between certain vibrational energy transfer channels is examined as a function of the translational temperature T_{trans} at specific distances X/D from the nozzle aperture. At $X/D \leq 1.5$, evidence is found for both endoergic and exoergic transfer channels. T_{trans} at $X/D = 1.5$ is determined from the authors' data to be 80 ± 10 K. It is established that the collision energy here is sufficient to support vibrational relaxation out of the 8^1 level via some endoergic transfers. The most efficient endoergic channel involves the addition of a single quantum of a low frequency out-of-plane mode with $\epsilon_{vib} = 127$ cm^{-1} . At $X/D \geq 2$, endoergic channels appear to close and only exoergic transfer is observed. The dominant exoergic channel from 8^1 is found to be transfer to the $^{13}B_{30}$ zero point level, reached through the loss of the v_8 quantum ($\Delta E = 435$ cm^{-1}). The collision energies at which endoergic transfer ceases to occur are found to agree with expectations based on an assumption of Maxwell-Boltzmann statistics and the estimation of T_{trans} for particular values of X/D using their spectroscopic data. (38 refs.)

112823 Self-correlation functions of rotational and translational motion in simple fluids. O.P.Revokatov, N.V.Brilliantov (Dept. of Molecular Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.90-3 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.76-9 (1983).

A model in which the motion of a molecule is regarded as a sequence of free paths and strong multiparticle collisions is proposed. The result of collision is characterized by conditional probability functions. The analytical expressions obtained for the self-correlation functions are in good agreement with machine experiments. (4 refs.)

112824 Vibrational relaxation of Ne_2^+ molecular ions during collisions with neon atoms. V.A.Ivanov, V.S.Sukhomlinov (A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.213-14 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.348-50 (Feb. 1983). [received: Sept. 1983]

The authors demonstrate that the vibrational relaxation rates of molecular ions can be found by analyzing the time behavior of the spectral line intensities in a decaying plasma. They studied the decay of the intensities of the 3593 Å ($3s'J[1/2]_0 - 4p'[1/2]_1$) and 5852 Å ($3s'J[1/2]_0 - 3p'[1/2]_1$) lines in a neon plasma. In the experiments the pressure ranged from 40-80 torr, the electron density was $n_e \approx 10^{10} \text{ cm}^{-3}$, the electron temperature in the afterglow was $T_e \approx 300\text{K}$, and the radius of the discharge tube was $R=2 \text{ cm}$. (8 refs.)

112825 Description of rotational energy exchange in collisions of diatomics. R.E.Mukhametzyanov.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.3, p.92-4 (July 1983). In Russian.

Analytical expressions for RT - and R - R -cross-sections of diatomics based on a generalized quasiclassical theory are proposed. All the considerations have been carried out for the N_2 - N_2 system. Results of calculations of rate constants and cross-sections are compared with other calculations and experimental data. 112826 Reference cross sections for K-shell ionization by light ions. H.Paul, W.Obermann (Inst. für Experimentalphys., Johannes-Kepler-Univ. Linz, Linz, Austria).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.15-19 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Reference cross sections, i.e. accurate cross sections obtained by averaging all the relevant published data points, are useful for practical applications and for comparison with theories. It is shown how such cross sections can be calculated for one type of projectile by using the data from a large range of target atomic numbers after normalizing the data by the Brandt-Lapicki (1981) theory. For protons, an analytical curve is given that describes the empirical deviation from that theory. This deviation is found to be small except at low scaled velocities. As an example, $\sigma = (95.2 \pm 1) \text{ b}$ is suggested as reference ionization cross section for 2 MeV protons on Cu; this is compared to recent theoretical values. For heavier projectiles up to chlorine, the deviation between the Brandt-Lapicki theory and experiment is found to be slightly larger, but qualitatively similar. (13 refs.)

112827 Accurate calculation of inner-shell ionization. D.Trautmann, F.Rosel (Inst. für Phys., Univ. Basel, Basel, Switzerland), G.Baur.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.21-7 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Inner-shell ionization is formulated in the semiclassical approximation, starting from a fully quantal approach. Classical trajectories in a screened Coulomb potential are used and the electron in the initial and final states are described by relativistic Hartree-Fock-Slater wave functions. Binding energy corrections due to the projectile field are applied. The agreement of the theoretical calculations with the rather detailed experiments (total cross sections, electron spectra, alignment) is generally very good. (22 refs.)

112828 The binding effect in alpha- and deuteron-induced L-shell X-ray production in the $Z=32$ -47 region. A.P.Jesus (Centro de Física Nuclear, Univ. de Lisboa, Lisboa, Portugal), I.R.Pimental, J.S.Lopes.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.29-34 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Experimental alpha- and deuteron-induced total L-shell X-ray production cross section ratios, $R = \sigma_{\alpha}/\sigma_{d\alpha}$, in the incident energy range 0.20 to 0.45 MeV/u are presented for elements Ge, Br, Zr, Mo and Ag; absolute cross section values are presented for Zr, Mo and Ag. The experimental ratios are always larger than the theoretical ones; further, the ratios of the higher-Z elements are quite independent of the reduced velocity. This is analogous to the situation found in the K-shell for elements ranging from Ca to Cu in a similar projectile reduced velocity range. The experimental absolute deuteron cross section values are lower than the theoretical ones by 10-30%; there is agreement with theory within the estimated errors. The alpha results show that, in the present incident energy range, the theoretical values decrease faster with energy decrease than the experimental ones. (18 refs.)

112829 Optimized basis states for inner-shell ionization. D.J.Land, D.G.Simons, M.D.Brown (Naval Surface Weapons Center, Silver Spring, MD, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.35-41 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

A theoretical study is described in which the region of validity of perturbed-stationary-state theory, the application of the adiabatic limit in the semiclassical approximation, is investigated for inner-shell ionization processes. The authors' particular interest is the proton-induced ionization probability of the K-shell. Time-dependent, perturbed basis states are constructed by means of a variational principle which minimizes the strength of excitation for an individual state as a function of projectile velocity. By using copper as a target,

they estimate that the adiabatic limit is appropriate for values of ξ , the ratio of the K-shell adiabatic radius to the K-shell radius itself, less than 0.8 to 1.0. Comparisons of calculations performed using perturbed-stationary-state theory are made with recent experimental data for the proton-induced total K-shell ionization cross section at energies between 0.5 and 2.4 MeV in targets from Sc ($Z=21$) to Zn ($Z=30$). Overall the agreement is quite good. However, a systematic trend for perturbed-stationary-state theory to overpredict the experimental values at the lower values of ξ is found. (14 refs.)

112830 L-shell Coulomb ionization. L.Sarkadi (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.43-8 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

A brief review of the most important features of the L-shell ionization of atoms by charged particle impact is given. It is shown that the direct Coulomb theories successfully describe the ionization processes as long as the perturbing effect of the projectile is small. For stronger perturbations induced by low velocity heavy ions, however, serious disagreement has been observed between the experimental cross section data and the theoretical predictions which indicates the failure of the hypothesis of the independent ionization of the individual atomic L sublevels. (15 refs.)

112831 Theory of L-shell ion-impact ionization: inclusive cross sections and multiple-vacancy (K-satellite) distributions. R.L.Becker (Oak Ridge Nat. Lab., Oak Ridge, TN, USA), A.L.Ford, J.F.Reading.

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.49-55 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

The authors' recent contributions to the theory of collisions of ions with target L-shell electrons are reviewed. They consider in particular KL' and KL'' multiple vacancy distributions. They have generalized from the traditional single-particle model to the independent Fermi particle model, thereby providing the first quantal derivation of the nearly binomial distribution which characterizes the K satellites and hypersatellites. The hole-hole Pauli correlation terms tend to average out because of 'random' phases, leaving a nearly classical distribution. Coupled-channels calculations of the mean L-shell vacancy probability per electron, \bar{p}_L , are described. The inclusion of shakeoff contributions to \bar{p}_L , particularly important for hypersatellites, is outlined. New questions raised by the present work are discussed. (17 refs.)

112832 Direct ionization and capture in inner-shell processes. F.D.McDaniel (Dept. of Phys., North Texas State Univ., Denton, TX, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.57-63 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Direct ionization (DI) and electron capture (EC) contributions have been inferred from target X-ray cross sections. Measurements have been made for the K-, L-, and M-shells for a range of selected projectile-target systems and ion-target electron velocity ratios. The inferred DI and EC results have been compared to Coulomb ionization theories consisting of the first Born and the perturbed stationary state (PSS) approaches. The comparison provides evidence of the validity of the PSS theory for the range of projectile-target systems and velocity ratios studied. (30 refs.)

112833 Probabilities for K-shell ionization and capture by light ions: scaling properties. E.Horsdal-Pedersen (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.65-71 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Theoretical approximate scaling relations for the probability of K-shell ionization and K-shell capture in collisions between moderately heavy target atoms (C, Ne and Ar) and light bare ions (H^+ , He^{2+} and Li^{3+}) have been tested experimentally. The scaling with respect to the projectile charge was studied only at one intermediate scaled velocity whereas the scaling with respect to the target atomic number has been tested at several intermediate or high velocities. The scaling laws are obeyed fairly well by the present set of experimental data. (18 refs.)

112834 Screening effects for excitation probabilities in ion-atom collisions. T.L.McAbee (Univ. of North Carolina, Chapel Hill, NC, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.89-92 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Transition probabilities for 1s-2s, 1s-2p and 2s-2p excitations due to the Coulomb interaction of a structureless projectile with a target atom or ion are derived in the first-order semi-classical approximation. Screened hydrogenic wave functions are used for the target electron, with the screening parameters determined through a self-consistent minimization of the total binding energy of the target atom. A straight line trajectory is assumed for the projectile. Analytic expressions are derived for the transition probabilities and compared with previous work by other authors. (6 refs.)

112835 Angular scattering in ion-atom collisions at intermediate energies. R.E.Olson (Phys. Dept., Univ. of Missouri-Rolla, Rolla, MO, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.103-7 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

The classical trajectory Monte Carlo method has been used to calculate $\text{H}^+ + \text{H}(1s)$ electron capture and ionization differential cross sections at energies of 25-200 keV. Angular scattering of the electron removed by the ionization process has been studied as a function of ejected electron velocity v_e . The classical calculations are in reasonable agreement with coupled-channel results for the 'electron capture to the continuum' (ECC) component of the ionization process where this term is defined as the ejected electron being more closely centered to the projectile than the target nucleus after the collision. The ECC cross section σ_{ECC} was studied as a function of collision energy (50-500 keV/amu) and projectile charge state ($q=1$ to 10). At high energies, σ_{ECC} scaled as $q^{2.3}/E^{2.5}$. The maximum value for σ_{ECC} was found at an energy $E_{\text{max}} \approx (56 \text{ keV/amu})q^{0.4}$. (17 refs.)

112836 Collisions involving hydrogen atoms. H.B.Gilbody (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, Belfast, N Ireland).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.109-15 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).

Experimental data on charge transfer and ionization obtained in this laboratory for collisions involving multiply charged ions are discussed and considered in relation to current theoretical models. (37 refs.)

12837 Spectra of np -1s transitions excited during the passage of 48 MeV lg ions through thin and thick carbon targets. R.J.Maurer, R.L.Watson, J.Pedrazzini (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.117-22 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). The spectra of Mg K X-rays produced during the passage of 48 MeV Mg ions through $8 \mu g/cm^2$, $800 \mu g/cm^2$, and thick carbon targets were measured using a curved crystal spectrometer. Transitions of the type np -1s in Li-, He-, and H-like Mg ions were identified for $n=1$ to 6. Detailed analyses of the peaks arising from the initial state configurations 1s2p, 2p, and 1s3p were performed to determine the energies and relative intensities of associated satellite components. (21 refs.)

12838 Excitation of hydrogen atom to the $n=2$ state by helium-ion impact. S.Datta, K.Roy, S.C.Mukherjee (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.401-3 (July 1983). The two-state distortion approximation in the impact parameter formulation is employed to calculate the cross-sections for $He^+(1s)+H(1s)\rightarrow He^+(1s)+H(n=2)$ collision process for the incident energy ranging from 16 to 2500 keV. The present results are in reasonably good agreement with those of the existing four-state calculation and the experimental findings. (10 refs.)

12839 Study of electron distributions of molecular orbitals by Penning ionization electron spectroscopy. K.Ohno, H.Mutoh, Y.Harada (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).

J. Am. Chem. Soc. (USA), vol.105, no.14, p.4555-61 (13 July 1983). Penning ionization electron spectroscopy (PIES) has been used to study spatial electron distributions of individual molecular orbitals. On the basis of comparison of observed band intensities with electron densities of ab initio molecular orbitals, a simple principle for orbital activities in Penning ionization has been established; the outer orbital which is exposed outside the van der Waals surface is active and the inner orbital which is localized inside the van der Waals surface is inactive. Penning ionization can be considered as an electrophilic reaction of rare gas atoms in metastable states with sample molecules. It is concluded that PIES is a sensitive method for probing orbital electron densities at the very frontier of the molecule where the molecule is attacked by the reagent. (39 refs.)

12840 On the origin of the dynamical differences between the Tang and Dalgarno-Henry-Roberts potentials for rigid rotor H_2 -H collisions. S.Margolis, B.A.Garetz (Dept. of Chem., Polytech. Inst. of New York, New York, NY, USA), N.Sathyamurthy.

J. Chem. Phys. (USA), vol.79, no.6, p.2736-41 (15 Sept. 1983). The authors compare their quasiclassical trajectory results for the $J=0\rightarrow 2$ rotational excitation in rigid rotor H_2 -H collisions with the close-coupling results of Choi and Tang (1975) on two different potentials. The authors trace the dynamical differences between the two potentials to the differences in the ellipticity of the repulsive potential-energy contours. They also discuss the application of their results to rotational excitation on the most accurate Siegbahn-Liu-Truhlar-Horowitz surface for the collision. (14 refs.)

12841 Collisional ionization as a nonlocalized process and the breakdown of the Franck-Condon approximation. K.-S.Lam, T.F.George (Dept. of Chem., Univ. of Rochester, Rochester, NY, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2799-803 (21 July 1983). It is demonstrated by a model computation based on a semiclassical theory that in collisional ionization the Franck-Condon approximation, equivalent to the assumption that the ionization event takes place locally, does not always apply. (13 refs.)

12842 Electronic excitation in alkali-rare-gas collisions. P.Andresen, R.Duren, H.Joswig (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).

J. Phys. B (GB), vol.16, no.18, p.3423-42 (28 Sept. 1983). The electronic excitation in collisions of potassium with rare gases (Ne, Kr and Xe) has been studied by measuring the dispersed fluorescence between 1300 and 9000 Å and the energy dependence of the fluorescence for some of the excited states. From these measurements for several collision energies the calibrated spectra, and the absolute emission cross sections for the K(4p) excitation and the Xe(6s) excitation have been deduced. A new theoretical model based on the interaction of the valence electron with the rare-gas atom is described. The properties of this interaction are found to be responsible for the qualitative features and with reasonable accuracy for the quantitative behaviour of the cross sections measured in collisional excitation experiments. (25 refs.)

112843 Collisions of hydrogen ions in a focused hollow beam. V.A.Belyaev, M.M.Dubrov, A.N.Khlopkin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.601-2 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1399-401 (Nov. 1982). [received: Sept. 1983]

The dissociation of molecular hydrogen ions in collision with each of ($H_2^+ + H_2^+$), has recently attracted interest in connection with research on controlled fusion. For an experimental study of the collisions of two ions at

low energies, the method of overtaking coincident beams would be quite useful. This method can be used to study ion-ion collisions at low energies, where experiments by other methods are extremely difficult (and have not been carried out). (5 refs.)

34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

112844 Near-thermal multi-charged ion interactions with hydrogen. D.A.Church (Phys. Dept., Texas A&M Univ., College Station, TX, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.9-13 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). Extensions of a method are discussed for studying charge transfer from hydrogen atoms to multi-charged ions stored at energies near 1 eV in a Penning ion trap. These extensions include spin-dependent charge transfer, electron spin-exchange between polarized hydrogen atoms and multi-charged ions, and laser excitation of the 2^3S-2^3P transitions of low Z helium-like ions for the purpose of ion detection. (24 refs.)

112845 Measurements of charge change in atomic collisions at MeV energies. B.M.Johnson (Brookhaven Nat. Lab., Upton, NY, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.73-9 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). Studies of the capture and loss of electrons to and from a fast moving ion as it interacts with atoms or electrons can reveal aspects of atomic-collision phenomena which have important implications for controlled fusion research. Several examples and the fusion relevance of such charge-change measurements for negative and high stripped positive ions at MeV energies are discussed. (28 refs.)

112846 Additivity failure in charge transfer from molecules to bound and continuum states of $\sim MeV/uH^+$, He^{+2+} projectiles. G.Bissinger (East Carolina Univ., Greenville, NC, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.81-7 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). Additivity of 'atomic' cross sections has been observed to fail in electron capture from hydrocarbon molecules to bound and continuum states of 0.6-3.2 MeV H^+ , He^{+2+} projectiles. This failure has been attributed to, and interpreted as, intramolecular secondary collisions that 'outscatter' the electrons from their original projectile-centered states. Estimates of the magnitude of this 'outscattering' effect from capture-loss calculations or a geometrical scattering model agree quite well with experimental results. These calculations have been used to estimate 'atomic' capture cross sections for the oxides and fluorides of C. In the case of bound state capture, these loss processes inject electrons into the continuum; evidence is presented for the observation of these electrons in the continuum cusp, but only in the case of the larger hydrocarbon molecules. (16 refs.)

112847 A simple classical model for the impact parameter dependence of electron capture. D.Brandt (Dept. of Phys. & Astron., Univ. of North Carolina, Chapel Hill, NC, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.93-6 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). A simple expression for the one electron capture probability in collisions of intermediate velocity, highly charged ions with atoms been derived in accordance with the Bohr-Lindhard capture model. Calculated total cross sections for capture from a helium target agree well with experimental data. The model has been applied to estimate nonresonant capture and excitation in $S^{13+} + He$ collisions. (13 refs.)

112848 Treatment of long-range couplings in collisional charge transfer from H(1s) to fully-stripped ions. W.R.Thorson (Dept. of Chem., Univ. of Alberta, Edmonton, Canada).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.97-101 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). Electron transfer from H(1s) to a fully-stripped ion of charge $+Z_A$ occurs dominantly to excited levels (nSZ_A), for low to intermediate collision energies ($E \leq 20$ keV/amu). To compute cross sections for capture into individual states (e.g. for predicting radiative emission in a plasma) it is necessary not only to solve the molecular-state close-coupling problem entailed in the primary charge-transfer event, but also to treat the effects of long-range dipole and quadrupole couplings produced by the receding proton among the n^2 quasi-degenerate levels with a given principal quantum number n . A simple, computationally efficient solution to the long-range coupling problem can be given, based on an application of the exact solution for the dipole coupling problem given previously by Demkov et al. (1974). If the quadrupole couplings are treated by the first Magnus approximation, the entire long-range coupling problem is reduced to calculation of the $n \times n$ matrix representation of a finite rotation for angular momentum $j=1/2(n-1)$, and the evaluation of simple numerical quadratures. (13 refs.)

112849 Theory of electron transfer in polar solvents. L.D.Zusman (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).

Theor. & Exp. Chem. (USA), vol.18, no.6, p.611-20 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.665-75 (Nov.-Dec. 1982). [received: Sept. 1983]

Electron-transfer reactions represent one of the most important classes of reactions occurring in polar solvents. The rate constant of such a reaction is dependent on how close the reactants come together and what are the interactions of the reactants with one another and with the polar solvent, and also on how fast the reactants pass through the reaction zone. The sphere model is familiar in formal chemical kinetics in describing reactions. In this model, the rate constant is specified at the boundary of the reaction zone, which is taken as independent of the diffusion coefficient. That value is considered as the phenomenological parameter of the model. Logical calculation on the rate constant should first provide a basis for the model from the microscopic theory of the elementary act; it is then possible to relate the phenomenological parameter to the probability of electron transfer in unit time $W_{12}(r)$, which is dependent on the distance between the reactants. Second, such a calculation indicates the applicability of the sphere model and gives a solution outside the limits of applicability. The author considers the construction of this theory in the approximation of pair encounters between reactants. (14 refs.)

34.80 ELECTRON SCATTERING

112850 Nonlinear absorption of electromagnetic radiation during collisions of particles in a strong magnetic field. S.A.Uryupin (V.I. Lenin All-Union Electrotech. Inst., Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.131-6 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.209-18 (Feb. 1983). [received: Sept. 1983]

The energy evolved per second per unit volume resulting from electron collisions in an intense RF electromagnetic field and in a strong magnetic field is calculated. It is shown that in the absence of a magnetic field, the effective electron-atom collision frequency ν_{e-n} determining the rate of absorption is directly proportional to the intensity of the varying electric field. An investigation of the effects of an external magnetic field on ν_{e-n} revealed that a nonquantizing magnetic field reduces the absorption of high-power radiation if the electron gyration frequency Ω is greater than the frequency of the absorbed radiation ω . If on the other hand $\omega \gg \Omega$, an external magnetic field has no effect on the electron-atom collision frequency. New nonlinear features of the collisional absorption of radiation are also discovered for quantizing magnetic fields when electron transitions to the zeroth Landau level are the main factor determining the absorption coefficient. It is found that ν_{e-n} is decreased in a quantizing magnetic field or in an intense RF field. Numerical estimates indicate that many of these effects should be experimentally observable. (26 refs.)

34.80B Elastic scattering of electrons by atoms and molecules

112851 Elastic scattering of electrons by hydrogen atoms in a laser field. M.A.Prasad (Div. of Radiological Protection, Bhabha Atomic Res. Center, Bombay, India), K.Unnikrishnan. *J. Phys. B (GB)*, vol.16, no.18, p.3443-51 (28 Sept. 1983). Cross sections for the elastic scattering of electrons by hydrogen atoms in a laser field have been calculated. Both direct and exchange amplitudes have been computed in the Born and Glauber approximations. The Franco-Halpern modification of the Ochkur approximation has been used to evaluate the exchange amplitudes. Differential cross sections are presented and discussed for electron energies of 100 eV and 54.4 eV, and for laser field orientations parallel and perpendicular to the direction of incidence of the electrons. (12 refs.)

112852 Measurement of differential cross sections of low-energy electrons elastically scattered by gaseous molecules. IV. Effect of intramolecular double scattering as observed in the scattering of 100 and 500 eV electrons by As_4 . H.Daimon, T.Kondow, K.Kuchitsu (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan). *J. Phys. B (GB)*, vol.16, no.18, p.3453-64 (28 Sept. 1983). For pt.III see *J.Phys. Soc. Japan*, vol.52, no.1, p.84 (1983). The relative differential cross sections of electrons scattered by gaseous As_4 at 300°C were measured by a cross-beam method at incident energies of 100 and 500 eV and at scattering angles between 2 and 135°. Calculations based on the independent-atom model including intramolecular double scattering and polarisation accounted for the measured cross sections; they were used to normalise the measured relative cross sections. (26 refs.)

112853 Future prospects in the development of gaseous electron diffraction. V.P.Spiridonov (M.V. Lomonosov Moscow State Univ., Moscow, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.939-42 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.138-42 (Nov.-Dec. 1982). [received: Sept. 1983]

The present review analyses unresolved problems, trends, and future prospects in the development of electron diffraction studies. (25 refs.)

112854 Anharmonic model for intensity of scattering of electrons by polyatomic molecules in the gas phase. A.G.Gershikov (Inst. of Phys. Organic Chem. & Coal Chem., Acad. of Sci., Ukrainian SSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.943-7 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.143-7 (Nov.-Dec. 1982). [received: Sept. 1983]

Equations are obtained for the intensity of scattering of fast electrons by an ensemble of polyatomic molecules and for the radial distribution function in the anharmonic approximation for the vibrational potential function. The physical meaning of the anharmonic parameters of the intensity equation is analyzed; these quantities are calculated for linear triatomic molecules; and the results are compared with those of other approaches. (21 refs.)

High energy elastic and inelastic electron scattering by the Ne and Ar atoms: electron correlation effects See Entry 112857

34.80D Atomic excitation and ionization by electron impact

112855 Electron-ion collisions of fusion interest. D.H.Crandall (Phys. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.214, no.1, p.129-37 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982). A brief review of current activities in research on collision of electrons and multicharged ions is presented. The relative importance of intermediate excited states, i.e. recombination resonances and directly excited autoionizing levels, is greater for multicharged ions than for singly charge ions. A few examples of fusion interest are presented to illustrate the effects of intermediate states and our developing understanding of their importance in all inelastic electron-ion collisions. (34 refs.)

112856 Ionization of the hydrogen atom by electron impact using adiabatic method. P.S.Mazumdar, M.Basu, A.S.Ghosh (Dept. of Theoretical Phys., Indian Assoc. for the Cultivation of Sci., Calcutta, India). *Indian J. Phys. Part B*, vol.57B, no.3, p.215-24 (June 1983). A distorted wave method in which the incident channel wavefunction is represented by an adiabatic one, is employed to calculate the triple differential cross section of the electron-impact ionization of the hydrogen atom at the incident energies 100 and 250 eV. The effect of exchange is neglected in the present calculations. The agreement between the present result with those of experiment and the corresponding theoretical prediction of Smith et al. (1979) is fair. (6 refs.)

112857 High energy elastic and inelastic electron scattering by the Ne and Ar atoms: electron correlation effects. A.Duguet, A.Lahmam Bennani, M.Rouault (Lab. des Collisions Atomiques et Moléculaires, Univ. de Paris-Sud, Orsay, France). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2786-92 (15 Sept. 1983). Elastic and inelastic differential cross sections (DCS) of high energy electrons (25 keV) scattered by neon and argon have been separately measured by totally independent methods. The effect of electronic correlations on the DCS and on the radial distribution functions $D(R)$ and $P(R)$ are deduced from experiment by comparison with theoretical Hartree-Fock values. An estimate of the correlation energy is also given. In the case of neon, the differences, with respect to Hartree-Fock, of the various contributions to atomic potential energy ΔV_{ne} , ΔV_{ee}^{Coul} , and ΔV_{ee}^{exch} are calculated from experiment and compared to theoretical results. (23 refs.)

112858 Resonances in the collision strength for electron excitation of the $1'S-2'S$ and $1'S-2^3P^0$ transitions in O VII. A.E.Kingston, S.S.Tayal (Dept. of Appl. Math. & Theoretical Phys., Queens' Univ. of Belfast, Belfast, N Ireland). *J. Phys. B (GB)*, vol.16, no.18, p.3465-78 (28 Sept. 1983). The R -matrix method is used to calculate the collision strengths for the electron excitation of the ground state of O VII to the $2'S$ and 2^3P^0 states. Results are presented for calculations in which the five lowest states (all $n=1$ and $n=2$ states) were included as target states and also for calculations in which the eleven lowest states (all $n=1$, $n=2$ and $n=3$ states) were included. The five-state calculations for the $1'S-2'S$ transition give many series of large resonances of the form $1s2ln'l'$ converging to the other $n=2$ thresholds. For the eleven-state calculations but for the eleven-state calculations there are also significant resonances of the form $1s3ln'l'$ converging to the $n=3$ thresholds. Resonance effects are quite small for the $1'S-2^3P^0$ transition. (23 refs.)

112859 Excitation of the 1P and 3P levels of a magnesium atom by electron impact. N.B.Avdonina, M.Ya.Amus'ya (Inst. of Refrigeration Technol., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.209-13 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.341-7 (Feb. 1983). [received: Sept. 1983]

Expressions for the differential and total cross sections for the $3s \rightarrow 3p$ 1P and $3s \rightarrow 3p$ 3P excitations in magnesium are derived to first order in perturbation theory using Feynman diagrams. The results are compared with experiment and with values derived in the close-coupling approximation. Good agreement with experimental cross sections is found for a wide range of scattering angles. It is concluded from the comparison with experiment that higher-order graphs must be included for small-angle scattering. (15 refs.)

112860 Cross sections for electron-carbon monoxide collisions in the range 1-4 eV. G.N.Haddad, H.B.Milloy (Electron & Ion Diffusion Unit, Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.473-84 (1983). The scattering of electrons from CO molecules has been studied over the energy range from 1 to 4 eV by analysing drift velocity data for pure CO and CO-inert gas mixtures at 294K. The validity of using the so-called 'two term approximation' for the velocity distribution function in the solution of the Boltzmann equation to analyse drift velocity data for the pure gas (and thus also for the gas mixtures) has been established. The momentum transfer cross section for CO has been determined in the energy range 1-4 eV, and the measurements of the vibrational cross sections by Ehrhardt et al. (1968) have been renormalized. By using a solution of the Boltzmann equation which avoids the two term approximation, these cross sections have been shown to be consistent with previous measurements of the transport parameter D_{\perp}/u in pure CO. (22 refs.)

112861 Formation of NH ($A^3\Pi$, $c^1\Pi$) by electron-impact dissociation of HN_3 . I.Tokue, Y.Ito (Dept. of Chem., Niigata Univ., Niigata, Japan). *Chem. Phys. (Netherlands)*, vol.79, no.3, p.383-9 (15 Sept. 1983). Emission spectra of the NH ($A^3\Pi-X^2\Sigma$) and NH ($c^1\Pi-a^1\Delta$) systems were observed by electron impact on HN_3 from threshold energies up to 70 eV. A new threshold for the formation of NH(A) is found near 16 eV. The relative vibrational population, $P(\nu=1)/P(\nu=0)$, for MH(A) depends on the impact energy. The rotational energy distribution of the $\nu=0$ level of the $c^1\Pi$ state can be approximated by an effective temperature of $2000 \pm 200K$, which is independent of the impact energy. The rotational temperature of the $\nu=0$ level of the $A^3\Pi$ state is $4500 \pm 400K$ at impact energy higher than 15 eV but is lower near the onset. The observed NH rotational temperatures are compared with those predicted by a simple statistical model. (23 refs.)

112862 Angular intensity distribution of Balmer- α emission excited by electron impact on H_2 . N.Takahashi, S.Arai, N.Kouchi (Dept. of Chem., Tokyo Inst. Of Technol., Meguro-ku, Tokyo, Japan), N.Oda, Y.Hatano. *J. Phys. B (GB)*, vol.16, no.18, p.L547-52 (28 Sept. 1983). The angular distribution of Balmer- α emission excited by electron impact on H_2 has been measured and compared with the results of polarisation measurements. A new factor, r , instead of a polarisation degree, has been presented to describe the anisotropy of emission of atomic radiation following dissociative excitation of molecules. (14 refs.)

112863 Calculation of the effective rotational transition probabilities for excitation by electron impact from the ground state $N_2 X^1\Sigma_u^+$ ($v=0$, k) to the excited state $N_2^+ B^2\Sigma_u^+$ (v', k') of nitrogen. G.I.Sukhinin, R.G.Sharafutdinov (Inst. of Heat Phys., Acad. of Sci., Novosibirsk, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.204-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.333-40 (Feb. 1983). [received: Sept. 1983]

Results are reported from a calculation of the effective probabilities of electron-vibrational-rotational transitions when the state $N_2^+ B^2\Sigma_u^+$ ($v'=0$) is excited by secondary electrons produced by ionization of nitrogen by a 10 eV primary electron beam. Use is made of the fact that the relative contribution from secondary electrons to emission from the first negative system of N_2^+ increases with distance from the center of the primary beam. The adiabatic approximation is used to calculate the transition probabilities from experimental data. It is shown that for secondary electrons, the probabilities of transitions with $\Delta k=3, 4, 5, \dots$ are comparable in magnitude to the probabilities of transitions with $\Delta k=\pm 1$. 112865 Three-dimensional structure of the methyl ester of N-(1-carbomethoxy-2-phenylethyl)azyl-phenylalanine, $C_{23}H_{26}N_2O_5$. A.F.Mishnev, Ya.Ya.Bleidelis, A.V.Eremeev, F.D.Polyak, B.S.Kataev (Inst. of Organic Synthesis, Acad. of Sci., Latvian SSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.984-8 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.86-90 (Nov.-Dec. 1982). [received: Sept. 1983]

The molecular and crystal structure was found for the methyl ester of N-(1-carbomethoxy-2-phenylethyl)-azyl-phenylalanine by the direct method and anisotropic refinement: All the hydrogen atoms were located. $R=0.056$. The azyl-phenylalanine dipeptide fragment showed shortening of the C=O bond (1.21 Å) and extension of the C-N bond (1.35 Å) relative to standard values. The substituents on the aziridine ring have trans orientation. The L-configuration of the azyl-phenyl residue was established using the known absolute configuration of the phenylalanine residues. Circular dichroism indicated L-configuration of the phenylalanine fragments of this molecule in solution. (29 refs.)

112866 Molecular structure from the viewpoint of the experimenter—the evolution of the concept and the problems arising. N.G.Rambidi (All-Union Sci.-Res. Center for the Study of Surface & Vacuum Properties, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.918-35 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.113-33 (Nov.-Dec. 1982). [received: Sept. 1983]

The problems and achievements in the study of the structure of molecules have been reviewed. Present-day ideas on the actual concept of the 'structure of a molecule' have been examined. Molecular structure has been defined as the set of functional characteristics and constants describing the relative positions and the relative motion of the electrons and nuclei in a molecule. The relationship between the molecular constants and models of the molecular structure has been examined, and the geometric structure and electronic structure of many interesting molecules have been analyzed. Considerable attention has been paid to the examination of 'nonrigid molecules'. (42 refs.)

112867 Standard reference data on the structure of inorganic molecules in the gaseous phase. S.M.Tolmachev (All-Union Sci.-Res. Center for the Study of Surface & Vacuum Properties, USSR). *J. Struct. The basic principles of the preparation of tables of standard reference data on the structure of molecules, and the information content of tables of internuclear distances in diatomic molecules and of structures of tri- and tetraatomic molecules have been examined. (8 refs.)

112868 Molecular and crystal structure of 2,2',4,4'-tetraaminodiphenyl at -120°C . G.V.Gridunova, V.E.Shklover, Yu.T.Struchkov, B.A.Chayanov (Sci.-Res. Inst. of Organic Intermediate Products & Dyes, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.166-9 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.286-90 (March-April 1983). [received: Sept. 1983]

An X-ray structural investigation of 2,2',4,4'-tetraaminodiphenyl (TADP) is made at -120°C . The angle of rotation of the Ph rings is 72° , and the conformation of the molecule is closer to the syn than the anti form. The packing of molecules in the crystal is governed by a branched system of intermolecular hydrogen bonds N-H...N. (23 refs.)

112869 Conformation of the four independent molecules in the structure of cyclo[-L-Val-L-Hyi-] and symmetry relations between them. N.E.Zhukhlis-tova, G.N.Tishchenko (Inst. of Crystallography, Acad. of Sci., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.177-8 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.303-5 (March-April 1983). [received: Sept. 1983]

The authors give the results of a quantitative comparison of the geometries of the four independent molecules in cyclo[-L-Val-L-Hyi-]. The conformation of one molecule differs from that of the other three, which closely resemble one another. The 'odd-man-out' molecule forms the greatest number of relatively short contacts with the other molecules. The loosest binding is observed in the peripheral C γ atoms, and the values of S—the criterion of geometrical likeness of the molecules—enable them to regard the molecules as identical or alike; the crystal structure is therefore considered from the viewpoint of the phenomenon of supersymmetry, and a system of local closed supersymmetry elements is found. (5 refs.)

112870 Effect of nonvalence interactions on the orientation of the phenyl ring at the tricoordinated phosphorus atom. O.A.Raevskii, I.O.Umarova, E.N.Tsvetkov (Inst. of Physiologically Active Substances, Acad. of Sci., Moscow, USSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.643-8 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.700-4 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors have carried out a theoretical conformational analysis of derivatives of phenyl phosphine in the atom-atom approximation with the aim of studying the nonvalence interactions on the orientation of the phenyl ring attached to a tricoordinated phosphorus atom. Compounds of the general formula R_2PPh , where $R=H, F, Cl, Br, I, CH_3, C_2H_5, i-C_3H_7, t-C_4H_9$, as well as unsymmetric derivatives of the type $CH_3R(P)Ph$, where $R=H, F, Cl, Br, I$, were considered. 35.20M Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility

112873 Permanent dipole moment and polarizability of a class of merocyanine dyes in their ground and first excited singlet state. W.Baumann (Inst. fur Phys. Chem., Univ. Mainz, Mainz, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.995-1002 (Sept. 1983). The permanent dipole moment of a class of merocyanine dyes in their ground and first excited singlet state has been determined studying the influence of an external electric field on the absorption of the compounds in various solvents. Evaluation of the experimental results on the basis of the Onsager reaction field model also gives values for the polarizability in the ground and excited state, the latter approaches the value of a respective conducting ellipsoid with the longer chainlength molecules. (19 refs.)

112874 An experimental and theoretical dipole moment study of 2-chloropyridine-5-sulphonyl chloride. H.Lumproso (Lab. de Chimie Generale, Univ. Pierre et Marie Curie, Paris, France), E.Montoneri, G.C.Pappalardo. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.1042-5 (Sept. 1983). Analysis of the dipole moment of 2-chloropyridine-5-sulphonyl chloride in benzene at 30°C (2.00 D) supports a model in which the C(5)-S-Cl group is rotated by 40° from the 2-chloro-1-pyridyl group. Such a model, with the S-Cl chlorine atom close to the 1-azanitrogen atom, may be explained by interplay of two conflicting factors, namely sulphony chloride-arene conjugation and lesser repulsion between one of the oxygen atoms and the azanitrogen atom. (24 refs.)

112875 Electronic polarizabilities and molecular properties of diatomic alkali hydrides. J.Shanker, H.B.Agrawal, A.K.Rajauria (Phys. Dept., Agra Coll., Agra, India). *Indian J. Phys. Part A*, vol.57A, no.3, p.155-63 (May 1983). Values of the binding energy, rotational-vibrational constants, dipole moments and their dependence on internuclear separation, and other higher order molecular spectroscopic constants are calculated for LiH, NaH, KH, RbH and CsH molecules using three different potential forms for the repulsion energy, and new values of molecular state polarizabilities calculated from the Seitz-Ruffa energy level analysis. The results obtained have been discussed and compared with experimental data. (20 refs.)

112876 Calculation of molecular polarizabilities using a semiclassical Slater-type orbital-point dipole interaction (STOPDI) model. R.R.Birge, G.A.Schick, D.F.Bocian (Dept. of Chem., Univ. of California, Riverside, CA, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2256-64 (1 Sept. 1983). The point dipole interaction model for molecular polarizability proposed by Applequist, Carl, and Fung [J. Am. Chem. Soc., 94, 295, 1972] is modified by replacing the point dipole interaction tensor with a descaled distributed charge interaction tensor. The authors procedure is based on the descaled tensor algorithm proposed by Thole [Chem. Phys., 59, 341, 1981] and uses a Slater-type orbital (STO) function to represent the charge distribution. The resulting STOPDI formalism calculates mean molecular polarizabilities and the components of the molecular polarizabilities with errors comparable to experimental uncertainty. Furthermore, these procedures require only one optimized parameter per atom, the average atomic polarizability. The formalism is invariant to coordinate transformations and avoids the discontinuities and/or false resonances that are characteristic of previous classical and semiclassical formalisms. The STOPDI algorithm requires less parameterization and computation time than the anisotropic atom point dipole interaction (AAPDI) model of Birge [J. Chem. Phys., 72, 5312, 1980] and is more reliable for the calculation of polarizability derivatives and Raman cross sections. The authors demonstrate, however, that none of the above significant bond stretching components. This is an inherent limitation of any formalism which does not explicitly account for electron density redistribution accompanying changes in the internuclear distances of covalently bonded atoms. 35.80 ATOMIC AND MOLECULAR MEASUREMENTS AND TECHNIQUES

112877 Photoacoustic-spectroscopic investigation on solutions of dyes in polymer matrices. W.Gortz, H.-H.Perkampus (Inst. fur Phys. Chem., Univ. Dusseldorf, Dusseldorf, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.1022-31 (Sept. 1983). In German. Dyes dissolved in polymer matrices are ideal systems to examine the RG theory. PVA and PVP were used as matrices. In these polymer matrices the thermal properties are given by the matrix molecules being present in excess. The dye molecule serves as an indicator. Thus the thermal properties, specific heat, temperature and heat conductivity of the matrix can be measured for thermally thick layers. Further investigations to examine the RG theory show that this theory can be used for the quantitative evaluation of photoacoustic measurements of thermally thick, non scattering samples. (14 refs.)

112878 Determination of the dissociation energies of molecules from absolute intensity measurements of their electronic transitions in SrCl flame spectra. V.N.Belyaev, N.L.Lebedeva, K.S.Krasnov, L.V.Gurvich (Inst. for High Temperatures, Acad. of Sci., USSR).

High Temp. (USA), vol.20, no.6, p.844-8 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1072-5 (Nov.-Dec. 1982). [received: Sept. 1983]

A procedure is presented for determining dissociation energies from measurements of absolute intensities of optical transitions of molecules in flame spectra. For a test of the method SrCl was chosen, for which the value $D_0(\text{SrCl}) = 417 \pm 8$ kJ/mole was obtained, in good agreement with data in the literature. The possibility is investigated of determining optical transition probabilities of molecules from spectroscopic measurements in flames on compounds with known dissociation energies. (14 refs.)

112879 Solution of the inverse spectral problem by variable metric methods. L.L.Gladkov.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1309-12 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.827-32 (Nov. 1982). [received: Sept. 1983]

The problem of the application of a number of methods of nonlinear programming to the solution of inverse spectral problems is discussed, and an algorithm is developed for the computer solution of this problem. The methods under consideration proceed from a quadratic approximation of the function f to be minimized, which is dependent on the force constant vector U : $f(U) = f(U_0) + \nabla^2 f(U_0) \Delta U + 1/2 \Delta U^T \nabla^2 f(U_0) \Delta U$, where ΔU is the vector of corrections to the force constants, ∇f is the gradient of the function, the superscript 'T' denotes transposition, and $\nabla^2 f$ is the matrix of the second derivatives, which is usually called the Hesse matrix. (6 refs.)

112880 Semiconductor detector for the selective detection of atomic hydrogen. K.C.Harvey, C.Fehrenbach, Jr. (Harrison M. Randall Lab., Univ. of Michigan, Ann Arbor, MI, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1117-20 (Sept. 1983).

A semiconductor detector is described which responds to the atomic hydrogen in an atomic beam but is insensitive to molecular hydrogen. The hydrogen flux is measured through the change in conductivity of the semiconductor material which occurs when the hydrogen is chemisorbed. The atomic flux from a RF hydrogen discharge is used to determine the sensitivity of the detector. The minimum detectable signal is $\sim 10^9$ hydrogen atoms $\text{mm}^{-2} \text{s}^{-1}$. The detector has a response time of less than 2 ms. (10 refs.)

36.00 STUDIES OF SPECIAL ATOMS AND MOLECULES

36.10 EXOTIC ATOMS AND MOLECULES (CONTAINING MESONS, MUONS, AND OTHER ABNORMAL PARTICLES)

112881 K^-p bound states with coupling to hyperon channels. R.H.Landau (Dept. of Phys., Oregon State Univ., Corvallis, OR, USA).

Phys. Rev. C (USA), vol.28, no.3, p.1324-33 (Sept. 1983).

The states of kaonic hydrogen bound by the combined Coulomb plus nuclear potentials are determined exactly in momentum space and a study is made of the dominant physics. Couplings to the Σ , K^0 , and Λ channels are included with different models for the strong potentials and different wave equations. The existence of both open and closed channels demands an extension of the Kwon, Tabakin, Lande treatment of the Coulomb singularity. Model studies indicate a high sensitivity to channel coupling and relativistic kinematics. The calculated K^-p atomic shift and width agree in magnitude with recent experiments, but the theoretical shift is towards the less bound whereas the experimental shifts appear more bound. (24 refs.)

112882 Mechanism of positronium ortho-para conversion in noble liquids. V.M.Byakov, V.R.Petuchov (Inst. of Theoretical & Experimental Phys., Moscow, USSR).

Radiochem. & Radioanal. Lett. (Switzerland), vol.58, no.2, p.75-89 (19 Aug. 1983).

It is suggested that for noble liquids the violation of the well known relation $I_N = I_2/3$ between the intensity I_N of the narrow component in the angular correlation curve of annihilation γ -quanta and the intensity I_2 of long lived components in their lifetime spectrum is caused by positronium orthopara conversion on the electrons knocked out by a positron at the terminal part of its track (where the motion of e^+ is diffusive). The expression is derived relating I_N/I_2 with the electron solvation time and parameters of the diffusive part of the e^+ track. (14 refs.)

112883 On the bubble model of positronium atom in liquids. V.M.Byakov, V.R.Petuchov (Inst. of Theoretical & Experimental Phys., Moscow, USSR).

Radiochem. & Radioanal. Lett. (Switzerland), vol.58, no.2, p.91-102 (19 Aug. 1983).

A bubble model of positronium atom in liquids is suggested, taking into account the surface tension dependence on bubble radius. This dependence is substantial since the bubble radius and diameter of the surrounding molecules are of the same order of magnitude. The conditions for positronium bubble formation are fulfilled also in liquids with high (up to 100 erg/cm^2) surface tensions. At the same time contradictions in theoretical conclusions and experimental results are explained. (7 refs.)

112884 Isotope shift measurements of muonic X-rays in $^{134,136,138}\text{Ba}$. W.Kunold, M.Schneider, L.M.Simons (Inst. fur Kernphys., Univ. Karlsruhe, Karlsruhe, Germany), J.Wust, R.Abel.

Z. Phys. A (Germany), vol.313, no.1-2, p.11-17 (1983).

The isotope shifts of muonic X-rays for the three stable Ba-isotopes $^{134,136,138}\text{Ba}$ have been measured with high accuracy. Especially the differences in the RMS radii $\Delta\langle r^2 \rangle$ have been determined in a model independent way and have been used to calibrate optical isotope shift data. (11 refs.)

112885 Parity non-conservation in muonic helium atoms. J.Bailey (NIK-HEF-K, Amsterdam, Netherlands).

Symmetries in Nuclear Structure. Proceedings of a NATO Advanced Study Institute on Symmetries in Nuclear Structure, Dronen, Netherlands, 16-28 Aug. 1982 (New York, USA: Plenum Press 1983), p.285-8

The author describes a difficult experiment, which may succeed if several unknown factors are favourable. The reason for doing the experiment is as follows. The electroweak interaction Hamiltonian H between a lepton (electron or muon) and a nucleus is $H = NC_1 H_1 + ZC_2 H_2 + S_0 C_3 H_3 + S_0 C_4 H_4$, where $C_2 = -C_3 = 1.2$, $C_1 = \epsilon = 1/2(1 - 4 \sin^2 \theta_w) \approx 0$; $C_4 = -1/2$; θ_w is the Glashow angle, so C_1 is much bigger than the other C s. This Hamiltonian contains 4 constants C , and different experiments test different combinations of these 4 constants, most measurements until now having been confined to electrons. In the standard model, the same 4 constants are also valid for muons, but this should be tested. The present experiment attempts to do this by making two measurements, on the muonic atoms of the two He isotopes. It is based on a suggestion by Bernabeu et al. (1974). Muonic atoms are smaller than normal atoms by a factor $m_\mu/m_e = 200$, so the muon is very close to the nucleus, thus enhancing weak-interaction effects (which are short-range). (no refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

112886 Site selective rare earth spectroscopy in proteins. M.A.Valentini, J.C.Wright (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.133-7 (2 Sept. 1983).

High-resolution laser techniques are shown to spectrally resolve europium substituted calcium ion binding sites of the protein thermolysin. Fluorescence line narrowing techniques are shown to reduce the linewidths by 30% for non-resonant transitions indicating that accidental degeneracies limit the spectral resolution attainable. (20 refs.)

112887 Time-correlation functions from computer simulations of polymers. T.A.Weber, E.Helfand (Bell Labs., Murray Hill, NJ, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2881-9 (21 July 1983).

Many of the rapid relaxation processes in polymers are related to conformational transitions of bonds from one state to another. Earlier research, based on Brownian motion computer simulation and kinetic theory, revealed that conformational transitions occur as single events and also as cooperative pairs. That research focused on kinetic rate parameters, but the experiments generally measure time-correlation functions of the system's properties. This paper is a report on the results of computer simulations of polymer time-correlation functions. The decay with time of both initial conformational states and initial vector orientations has been studied. The correlation functions fit well to a two-factor functional form, suggested by recent theoretical research. The first factor is an exponential decay arising from single transitions. The second is a diffusional term related to the correlated pair transitions. The total transition rate when compared with the earlier kinetic studies is in reasonable agreement. Since the functional form has been shown here to fit the simulations, it is suggested that it will be of value in interpreting relaxation experiments. (11 refs.)

112888 Conformational properties of perfluoroalkane chains. VII. Carbon-13, fluorine, and proton spin-lattice relaxation of poly(decamethylene perfluorosebacate) in solution and the local mobility of the fluorocarbon chain. K.Matsuo, W.H.Stockmayer (Dept. of Chem., Dartmouth Coll., Hanover, NH, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2911-14 (21 July 1983).

Chloroform- d solutions of poly(decamethylene perfluorosebacate) were studied by ^{13}C , ^{19}F , and ^1H NMR. Proton-decoupled or fluorine-decoupled ^{13}C spin-lattice relaxation times were measured over the temperature range $5-75^\circ\text{C}$. Mean orientational correlation times for C-F and C-H bonds are found to differ by a factor of only about 2.3 (e.g., 104 and 45 ps at 25°C), and have equal activation energies of about 3 kcal mol^{-1} . The ^{19}F relaxation data are consistent with the ^{13}C results. (30 refs.)

112889 Conformational aspects of a 'very simple' chain: polyacetylene. E.Cernia, L.D'Illario (Assoreni, Monterotondo, Rome, Italy).

J. Polym. Sci. Polym. Chem. Ed. (USA), vol.21, no.8, p.163-76 (Aug. 1983).

Potential energy calculations of the isolated chains of trans- and cis-polyacetylene (PA) were made to obtain information on the most probable conformations. Different sets of van der Waals potential functions, different values for the barrier height to the bond rotation, and different geometries for the repeating unit were used. Calculations were also made of the seven-atom chains of PA for which independent rotations were allowed around three consecutive 'quasi-single' bonds. The deepest minima on the potential energy map of the trans three-atom chain were consistent with an all-trans conformation (the most stable one) and with a 'distorted cis' conformation, which deviated from the planarity because of the repulsion between hydrogen atoms 1 and 4. The energy maps of the cis polymer showed two minima, both of which corresponded to nonplanar conformations. From the seven-atom chain analysis of trans- and cis-PA, in addition to the stable conformations obtained for the three-atom chains, other minima correspond to triplets formed from both conformers. (34 refs.)

112890 Network structure description and analysis of amine-cured epoxy matrices. H.S.Chu, J.C.Seferis (Dept. of Chem. Engng., Univ. of Washington, Seattle, WA, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.53-126

A network description and analysis for relatively complex epoxy-diamine systems of commercial significance as matrix materials for high performance composites is presented. The method of analysis was based on the probability of the epoxide groups reacting with an amino hydrogen as a function of reactant composition and extent of secondary amine reaction. Application of this analysis was focused on epoxy-diamine systems approximating commercial

compositions with stoichiometric or excess amounts of epoxies reacting with a multifunctional diamine. Systems made up with a single epoxy or two distinct epoxies with functionalities of two or larger were described. (30 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

12891 An ab initio SCF study on the stability and structure of $\text{H}_2\text{CN}^+ \cdot n\text{N}_2$ clusters. T.-K.Ha (Lab. of Phys. Chem., Swiss Federal Inst. of Technology, Zurich, Switzerland), M.T.Nguyen. *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.855-8 (Aug. 1983).

The clustering energies and geometries of the $\text{H}_2\text{CN}^+ \cdot n\text{N}_2$ ($n=1, 2$ and 3) species have been determined by ab initio SCF calculations with the 4-31G basis set. The calculated clustering energies are in good agreement with the experimentally estimated heats of formation of the corresponding clusters. The stability of various conformers has been studied in terms of localized orbitals and charge distributions. (11 refs.)

12892 A digital processing method for structural analysis of atom clusters from high resolution electron micrographs. K.Kanaya, K.Takamiya, M.Shino, C.Shinohara (Dept. of Electrical Engng., Kogakuin Univ., Tokyo, Japan). *Micron (GB)*, vol.14, no.2, p.119-34 (1983).

The electron image contrast of tungsten atom clusters changes remarkably depending on the spatial frequency, scattering factor phase, lens aberration and defocusing, but it is confirmed that the image appears in negative contrast and satisfies an anastigmatic condition when recorded under optimum focus. When based on a cluster model, the spatial frequencies can be divided into individual atom clusters by successive band pass filters. An electron micrograph taken at the optimum focus condition is selected from a defocus series of micrographs and is used for digital processing. In order to measure the exact size of the clusters, the enhancement of filtered images by their gradient images to extract edge information and the subsequent superimposition of both images are derived. Based on Fourier analysis, it is proposed that tungsten films consist of double cluster layers which correspond to a thickness consisting of 3-5 single atoms. In addition, their three-dimensional localization can be determined more precisely than by earlier computer-aided reconstruction methods. The cluster models are in good agreement with the processed data suggesting that the amorphous phase is a distinct phase and not microcrystalline. (39 refs.)

12893 Zonal harmonic functions from two dimensional analogs of Jacobi polynomials. J.N.Boyd, P.N.Raychowdhury (Virginia Commonwealth Univ., Richmond, VA, USA).

Appl. Anal. (GB), vol.16, no.3, p.243-59 (1983).

The class I orthogonal polynomials in the complex variables z and \bar{z} are reviewed. These polynomials are two dimensional analogs of the Jacobi polynomials and are orthogonal on the unit disk with respect to the weight function $w(z, \bar{z})$. The polynomials are then shown to be eigenfunctions of a certain partial differential operator. Using these polynomials, a class of zonal, harmonic, homogeneous polynomials is defined in \mathbb{C}^n . In the case that $n=2$, applications to electrostatic potentials are given. (9 refs.)

12894 A Fourier series approach to magnetostatic field calculations involving magnetic material. J.Caldwell (School of Math., Statistics & Computing, Newcastle upon Tyne Polytech., Newcastle upon Tyne, England), A.Zisserman.

J. Appl. Phys. (USA), vol.54, no.9, p.4734-8 (Sept. 1983).

The effect of iron on the uniformity of the field produced by an axisymmetric thick solenoid is considered. Using a Fourier series approach, an exact solution for the vector potential A is found and from this the magnetic induction B is derived. The results are compared with those obtained from previous approximate methods. (3 refs.)

112895 Electrostatic fields in an ionization chamber electret. B.G.Fallone, E.B.Podgorsak (Dept. of Radiation Oncology, McGill Univ., Montreal, Quebec, Canada).

J. Appl. Phys. (USA), vol.54, no.9, p.4739-48 (Sept. 1983).

The theory of linear systems is used to derive the potential and electric field in distance space in a cylindrical polarization/depolarization electret chamber. General solutions for the near, intermediate, and far regions are given and their domains of convergence discussed. On the axis of the chamber the solutions for the electret surface are equal to those obtained from Gauss's and Kirchhoff's laws, and at large distances from the surface to those obtained from the introduction of a dipole layer model. (30 refs.)

Electrostatic acceleration of a modulated electron beam See Entry 112917

41.10F Steady-state electromagnetic fields; electromagnetic induction

112896 On the convergence of numerical results in modal analysis.

M.Leroy (Sedacip Sarl, Tour Alpha, Les Ulis, France).

IEEE Trans. Antennas & Propag. (USA), vol.AP-31, no.4, p.655-9 (July 1983).

Previous studies of the relative convergence (RC) phenomenon in modal analysis showed the need to introduce the edge condition by using an explicit asymptotic behavior of modal coefficients. The author does not agree that the edge condition is the only means of uniquely defining a solution. It is demonstrated that the RC can be avoided by including only the bounded feature of modal coefficients. The analytical computations are given in solving the bifurcated parallel plate waveguide. To solve the general problem of convergence of numerical results, a proof is given of this convergence in modal analysis. The required condition is the use of a 'well-conditioned' linear system. With this demonstration, the use of the condition number as purely numerical criterion is justified to ensure the convergence of results. (9 refs.)

112897 First indication of ampere tension in solid electric conductors.

P.Graneau (Francis Bitter Nat. Magnet Lab., MIT, Cambridge, MA, USA).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.253-5 (5 Sept. 1983).

An empirical law for the mechanical force between two current-elements, originally deduced by Ampere from a series of classical experiments, asserts that an electric current flowing along a straight wire should place the wire in tension. The existence of longitudinal Ampere forces at solid-liquid conductor interfaces has been demonstrated by various investigators during the past 160 years. This letter contains the first report of pulse currents creating sufficient tension to cause fracture in hot copper and aluminium wires. (6 refs.)

112898 Fourth moments of thermal fluctuations in the electromagnetic field in a homogeneous and isotropic medium. R.L.Stratonovich, A.V.Tolstopyatenko.

Radio Eng. & Electron. Phys. (USA), vol.27, no.11, p.107-12 (Nov. 1982).

Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2185-90 (Nov. 1982). [received: Sept. 1983]

Using the cubic relationships of nonlinear fluctuation-dissipation thermodynamics, four-point correlators are obtained and, as a result, also the moments of the thermal fluctuations in an electromagnetic field. The nonlinear medium is assumed to be unbounded. The result is given in spectral form. In the absence of spatial dispersion, the obtained expression contains two numerical parameters that are not determined by dissipation. (7 refs.)

112899 Constant boundary element solution for steady-state convective diffusion equation in three dimensions. M.Ikeuchi, M.Sakakihara (Graduate School of Sci., Okayama Univ. of Sci., Okayama, Japan), K.Onishi.

Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan), vol.E66, no.6, p.373-6 (June 1983).

A boundary element solution is formulated for steady-state convective diffusion equation with the Dirichlet's boundary condition. A simple example is considered in three dimensions. It is shown that the boundary element solution is unconditionally stable. In order to demonstrate the usefulness of the boundary element solution, the comparison with finite element solutions is given. (12 refs.)

41.10H Electromagnetic waves: theory

112900 Diffraction of an EM wave by an absorbing circular cylinder.

P.Langlois (Dept. de Radioelectricite, Univ. de Provence, Marseille, France).

Opt. Acta (GB), vol.30, no.10, p.1373-96 (Oct. 1983).

Some expressions for the EM field diffracted by an absorbing circular cylinder of large radius in the Fresnel region are developed. Until recently results were available only for the far field of 'good conductors'. The derived equations agree with Young's theory of diffraction since the diffracted field may be expressed as two cylindrical waves which seem to arise from the two 'edges' of the cylinder. Numerical calculations are also presented and compared with previous experimental results. (20 refs.)

112901 Ray model for attenuated total reflection from a weakly absorbing dielectric. S.S.Gupta, D.P.Tewari (Dept. of Phys., Indian Inst. of Technol., New Delhi, India).

Opt. Acta (GB), vol.30, no.10, p.1397-403 (Oct. 1983).

An approximate ray picture has been presented for attenuated total reflection of a plane electromagnetic wave from a weakly absorbing dielectric. An analytical expression for the reflection coefficient has been obtained for an angle of incidence larger than the critical angle. The method of limiting absorption is seen to establish the Carter-Hora conjecture regarding the validity of Renard's formula for lateral shift on account of total reflection. Potential applications of the work are discussed. (22 refs.)

112902 Propagation of waves in a medium with large-scale random inhomogeneities. M.V.Tinin (Irkutsk State Univ., Irkutsk, USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.29-36 (Jan. 1983).

Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.36-43 (Jan. 1983).

[received: Sept. 1983]

Describes an integral representation for the field in a randomly inhomogeneous medium. This integral representation takes care of the problem summing the fields of geometric-optic waves in a region where multiple rays occur. Asymptotic analysis of the integral representations for the second and fourth moments are in good agreement with results obtained previously by the phase-screen method. The behavior of the mean intensity in the vicinity of a simple caustic of the unperturbed field is analysed. In the presence of large phase fluctuations, the scale on which the intensity falls off exponentially in the region of the caustic shadow does not depend obviously on the frequency

(unlike the case of no fluctuations), but is determined by the dispersion of the ray deviations. (15 refs.)

112903 Electromagnetic wave diffraction on a two-dimensionally periodic lattice of semiinfinite dielectric rods. V.M.Krekhtunov, V.A.Tyulin (N.E. Bauman Higher Tech. School, Moscow, USSR). *Radiophys. & Quantum Electron. (USA)*, vol.26, no.1, p.63-9 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.74-81 (Jan. 1983). [received: Sept. 1983]

The field projection matching method is used to solve the problem of electromagnetic wave diffraction on a 'free space-two-dimensionally periodic dielectric structure' boundary. In certain regions, orthonormalized systems of the transverse vector functions of homogeneous and transverse-inhomogeneous Floke channels are used. The problem is reduced to solution of an inhomogeneous system of linear algebraic equations in elements of the scattering matrix of the system considered. The convergence of the solution is studied numerically for increasing number of base functions in the representation of the unknown field, and the behavior of the lattice reflection coefficient as a function of the incident wave and structure parameters is analyzed. (15 refs.)

112904 Simulation model of ray propagation in a three-dimensional turbulent medium. P.I.Akimov, S.I.Baskakov (Moscow Power Inst., Moscow, USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.70-8 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.82-90 (Jan. 1983). [received: Sept. 1983]

The principle of modeling a three-dimensional turbulent medium by a set of spherically symmetrical inhomogeneities of various space scales is described. A relationship is established between the parameters of the model and the parameters of the spatial spectrum of the permittivity fluctuations of the modeled medium. An algorithm is described for plotting the ray paths in the modeled medium, along with a method for determining the eikonal and electromagnetic wave intensity in Lagrangian coordinates. The results of numerical experiments to calculate the ray-path characteristics and fluctuations of the eikonal are given for a medium in which the permittivity fluctuations have a Karman spectral function. The modeling results are compared with the existing analytical solutions for a continuous medium. (15 refs.)

112905 Reflectivity of spherical shield. S.S.Vinogradov (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.78-88 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.91-102 (Jan. 1983). [received: Sept. 1983]

A rigorous solution to the vector problem of diffraction by an ideally conducting sphere with a hole is obtained by a numerical method. The boundary conditions for Debye potentials are formulated correctly and found to be intervalled. Both total cross section for scattering and cross section from backscattering are calculated. (12 refs.)

112906 Scattering of a planar wave from solids of revolution, covered by absorptive materials. I.Ye.Arsayev.

Radio Eng. & Electron. Phys. (USA), vol.27, no.11, p.33-41 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2101-9 (Nov. 1982). [received: Sept. 1983]

The method of geometric optics is used to solve the problem of scattering of electromagnetic waves from an impedance solid of revolution, covered by a homogeneous absorptive material when the wave is incident along the body axis. The solution is obtained in the form of a series whose terms are determined from recursive formulae. The terms of the series are derived in an explicit form for backscattering. The accuracy of the obtained solution is estimated. The effect of the curvature of the body surface and of the cover on the scattering characteristics is investigated. Conditions are determined under which the backscattering can be substantially decreased. (9 refs.)

112907 The method of variation of constants for the solution of the Helmholtz equation, illustrated by the problem of diffraction on a nonhomogeneous sphere. Ya.N.Fel'd.

Radio Eng. & Electron. Phys. (USA), vol.27, no.12, p.42-52 (Dec. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.12, p.2323-32 (Dec. 1982). [received: Sept. 1983]

A method of variation of constants is developed for solution of nonhomogeneous problems of mathematical physics. The presentation is based on the example of the Helmholtz equation. The excitation of a radially nonhomogeneous sphere by an arbitrary system of sources is considered. The solution is constructed in the form of partial-wave expansions of discrete and continuous spectra, with coefficients which depend on a single variable. Different forms of solution are obtained, depending on the choice of that variable. These solutions are suitable for computations when the radius of the sphere is large or comparable to a wavelength. The method is illustrated by the example of a homogeneous Lunenburg lens. (6 refs.)

112908 Anomalous wave scattering by a finite number of longitudinally slit cylinders of small wave dimensions. E.I.Veliev, V.V.Veremei, V.P.Shestopalov (Inst. of Radiophys. & Electronics, Acad. of Sci., Kharkov, Ukrainian SSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.580-1 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1349-53 (Nov. 1982). [received: Sept. 1983]

Considers the excitation by a magnetic-current filament of a reflector formed by a finite number (N) of circular cylinders with a longitudinal slit (the angular size of the slit is θ) distributed uniformly over a circular arc of angle α and radius R_1 . The authors assume that the cylindrical screens are infinitesimally thin and ideally conducting. This problem has been solved rigorously for an arbitrary arrangement of screens. (5 refs.)

112909 Diffraction of electromagnetic waves by a periodic screen with holes of arbitrary shape. V.A.Kaplun, I.T.Kravchenko, D.A.Tsaryuk.

Telecommun. & Radio Eng. Part 2 (USA), vol.37, no.9, p.72-6 (Sept. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.9, p.32-7 (Sept. 1982).

The transverse section method is used to solve the problem of the diffraction of a plane wave by an infinite perforated metal screen, taking into account its finite thickness and assuming the holes to be filled with a dielectric. The working relations obtained are in a good agreement with experimental data. The screens considered can be used as radomes for protecting antenna systems. (7 refs.)

112910 Analysis of scattering problems by means of charge simulation method. A.Komiyama (Faculty of Engng., Meiji Univ., Kawasaki, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.166B, no.6, p.790-7 (June 1983). In Japanese.

The charge simulation method is a numerical technique which is used in electrostatics, especially for calculation of the electric field in high voltage apparatus. It has recently been used in fields other than electrostatics. The author applies the charge simulation method to the problem of electromagnetic scattering by a perfectly conducting cylinder with arbitrary cross section and demonstrates the effectiveness of the technique in this field. Firstly,

theory and formulae for the method of source simulation are given. The scattering by a circular cylinder with known exact solution is treated, and characteristics of its errors are discussed. Finally, to show the effectiveness of this technique, scattering problem by two circular cylinders having different radii is treated. Total electric field distribution in the vicinity of cylinders, forward scattering cross section and scattering pattern are given. (13 refs.)

41.70 PARTICLES IN ELECTROMAGNETIC FIELDS: CLASSICAL ASPECTS

(inc. synchrotron radiation)

112911 An explicit Lagrangian for a system of charged particles to higher-order terms: quadrupole radiation. D.Dionysiou (Dept. of Math., Hellenic Air-Force Acad., Dekelia-Attica, Greece).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.413-18 (Aug. 1983). Gives an explicit formula for the Lagrangian for any number of charged particles interacting with each other up to the fifth-order terms, assuming that this system does not emit dipole radiation. The quadrupole radiation, in exact agreement with the classical electromagnetic theory. (8 refs.)

112912 Microdischarge characteristics in air gap between spherical particle and plane. M.Hara (Dept. of Electrical Engng., Kyushu Univ., Fukuoka, Japan), T.Yamashita, M.Akazaki.

IEE Proc. A (GB), vol.130, no.6, p.329-35 (Sept. 1983).

Microdischarge behaviours in a gap between the plane electrode and a charged conducting spherical particle moving in the presence of external electric field have been investigated. The microgap studied has distinctive features: the field strength in the microgap changes very rapidly with the motion of the sphere even if the applied external electric field is static, the boundary of the microgap changes with time, and the potential difference across the microgap is influenced from the occurrence of discharge due to the neutralisation of charge on the sphere by the charge carrier in the discharge itself. The random appearance of an initiating electron required for the development of an avalanche and the rapid changes of electric field, gap boundary and potential difference result in the statistical behaviours of microdischarge. The statistical characteristics at the microdischarge threshold and on the microdischarge length have been measured, and the microdischarge mechanism has been discussed to explain the characteristics. (21 refs.)

112913 Synchrotron radiation of wiggled electron beam in rectangular waveguide. H.A.Haus, M.N.Islam (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.4784-93 (Sept. 1983).

An analysis is presented of the spectrum radiated by an electron beam passing through a magnetic wiggler in a rectangular waveguide using a coupled-mode approach. The noise power radiated into each mode of the waveguide is calculated. In the limit of a highly overmoded waveguide and large relativistic parameter, the total emitted spectrum approaches that of a beam in free space. The radiation formulas are greatly simplified for a weak magnetic field. (8 refs.)

112914 Analysis of the propagation of electron waves inside and outside the passband of periodic structures. A.V.Osin, V.A.Solntsev.

Radio Eng. & Electron. Phys. (USA), vol.27, no.11, p.127-33 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2207-14 (Nov. 1982). [received: Sept. 1983]

On the basis of the theory of excitation, the propagation and attenuation constants of electron waves are analyzed as a function of the parameters of the interaction between the electron stream and the periodic slow-waves structure field at frequencies close to a positive and negative dispersion are discussed. A comparison is made with the well-known theory of three electron waves within the passband, as well as with the known results obtained on the basis of the method of equivalent circuits within and outside the passband. The limits of applicability of the three-electron-wave theory are determined. (6 refs.)

112915 Coherent scattering of surface waves from an electron stream whose velocity is modulated in space. N.B.Lerner, B.G.Tsikin.

Radio Eng. & Electron. Phys. (USA), vol.27, no.12, p.147-53 (Dec. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.12, p.2442-7 (Dec. 1982). [received: Sept. 1983]

An approximate nonlinear theory is developed of the interaction between a surface electromagnetic wave and electron beam whose velocity is modulated in space. Conditions are determined for conversion of the surface wave into a volume wave without changing frequency, as well as conditions for generation of volume waves in such interaction systems. The intensities of volume waves for the fundamental frequency and second harmonic are analytically estimated. (3 refs.)

(see also 07.80 Electron and ion microscopy, 07.77 Beam handling equipment)

112916 Charged particle ray simulator and monitor. E.Kisker (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1113-16 (Sept. 1983). A new method is described for simulating charged particle rays in arbitrary electrostatic lens system of cylindrical symmetry. The method is so efficient (>4 ms/step) that even for complex lens systems the trajectories can be computed and displayed during the lens voltage adjustment, using the same laboratory microcomputer which controls the lens voltages. The time lag between a change of a lens element voltage and the trajectory display is of the order of a few seconds for long, multielement lens systems. This also allows one to optimize the voltage combinations by performing trajectory calculations for many lens voltage settings. The performance is demonstrated by comparing with recent experimental data of Heddle and co-workers on imaging properties of a three-element tube lens. As an application of the fast computation time feature, trajectories and voltages are shown for a lens system providing an electron optically adjustable angle resolution as used in a spin polarized photoemission experiment with synchrotron radiation. (9 refs.)

Charged particle beam envelopes See Entry 112499

41.80D Electron beams and electron optics

112917 Electrostatic acceleration of a modulated electron beam. Yu.K.Alekseev, A.I.Kostienko (Dept. of VHF Radiophys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.28-31 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.25-9 (1983). The problem of pumping power into a modulated electron flux is considered. With dynamic modulation of the flux, power pumping leads to slowing of the grouping process and reduction in beam efficiency. In the case of electrostatic control of the current's form however, its spectral composition and electron efficiency are retained. (4 refs.)

112918 Interferometrical processing of electron microscopic holograms. III. Investigation of special features of the differential interferometry including noise problems. K.-J.Hanssen (Phys.-Tech. Bundesanstalt, Braunschweig, Germany). *Optik (Germany)*, vol.65, no.2, p.153-77 (1983). In German. For pt.II see ibid., vol.63, p.285 (1983). The graininess in reconstructions of electron off-axis-holograms is essentially caused by the unscreened part of the noise spectrum which is introduced by the granularity of the photographic plate. It is a linear function of the scattering amplitude within the aperture. Expressions for the noise in simultaneous reconstructions are given. In the case of reconstructions with differential contrast employing two holograms with identical grain, the interference patterns in the noise spectra offer great help for adjustment purposes. Additional experimental results and some advantages and disadvantages of two different interferometrical reconstruction arrangements are discussed. (11 refs.)

112919 Investigation of a double-beam linear high-voltage electron-optic system with centrifugal electrostatic shaping and recovery of electron energy. L.I.Andrikanis, N.S.Bunina, M.Z.Melikov. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.11, p.140-3 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2222-5 (Nov. 1982). [received: Sept. 1983] Results were presented of an experimental investigation and calculation of a linear double-beam electron-optic system with centrifugal electrostatic shaping (the length of the high-voltage gap was 6 cm). Recovery of the energy of the electron streams after striking the open surface type collector was ensured. (4 refs.)

42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

112920 Sellmeier fits with linear regression; multiple data sets; dispersion formulas for helium. E.R.Peck (Phys. Dept., Univ. of Idaho, Moscow, ID, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2906-13 (15 Sept. 1983).

Linear regression, combined with search over nonlinear parameters is useful in fitting Sellmeier formulas to dispersion data. A special advantage accrues in fitting several sets of data to one formula: linear regression permits systematic normalization to a common absolute value. Rational procedures are discussed also for weighting of data set of unequal precision. The fitting of

common formulas to six sets of data on helium, for wavelengths from 0.09 to 2 μ m, illustrates the various procedures. (13 refs.)

112921 Tracing finite rays through a Fresnel lens. I.Powell (Nat. Res. Council of Canada, Ottawa, Ontario, Canada). *Appl. Opt. (USA)*, vol.22, no.18, p.2924-6 (15 Sept. 1983). In this study the author shows that with minor modifications it is possible to adapt an existing optical design program to trace finite rays through a system containing Fresnel surfaces. Practical examples are given to illustrate the validity of the author's rather simple approach to this problem. (2 refs.)

112922 Complex amplitude propagation through a quadratic-index medium: characteristic point function. C.Gomez-Reino, E.Larrea, M.V.Perez (Dept. de Optica, Santiago de Compostela, Spain). *Appl. Opt. (USA)*, vol.22, no.18, p.2927-9 (15 Sept. 1983). The propagation of a complex amplitude distribution in quadratic-index material is studied by the characteristic point function, and the authors determine the maximum distance for which an optical image and transform can be transmitted without estimable loss of information due to modal dispersion. (7 refs.)

112923 The spot of Arago and its role in wavefront analysis. J.E.Harvey (Inst. for Modern Optics, Univ. of New Mexico, Albuquerque, NM, USA), J.L.Forgham, K.Von Bieren. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.2-9 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The 'spot of Arago' has been a controversial topic since its inception in 1818 when Poisson predicted its existence, which violated common sense, in an attempt to discredit Fresnel's wave theory of light. Arago performed the experiment and found the surprising prediction was true, thus putting Fresnel's theory on a firm technical foundation. In recent years, the spot of Arago, which exists as a bright spot at the center of the geometrical shadow of a circular obstruction, has caused substantial grief in various high energy laser applications and has come to be considered more of a nuisance than a curiosity. The authors suggest that the size and shape of the spot of Arago is characteristic of the wavefront aberrations of the incident beam and can therefore be used to advantage as a beam sample for wavefront analysis of annular beams. The implementation of this wavefront sampling scheme would eliminate the requirement for a special beam sampling optical component and thus reduce to a minimum the deleterious effects upon the beam frequently accompanying the use of such components. Both experimental and numerical results are presented along with a discussion of the capabilities and limitations of this particular beam sample for performing various wavefront sensing functions. (2 refs.)

112924 Study of spatial filtering using LOTS-MCI. C.A.Boye (Air Force Weapons Lab., Kirtland Air Force Base, NM, USA), W.Swantner, G.Lawrence. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.15-18 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

The Laser Optical Train Simulation (LOTS) computer program was developed for the Los Alamos National Laboratory laser fusion program and was built to do end-to-end physical optics analysis of the laser train. The wavefront analysis program MCI was originally written as an interferogram reduction program. Given a data set of triplets (fringe number, x-coordinate, y-coordinate), the coefficients for Zernike polynomials are computed. The program has also been linked with the optical design and analysis program ACCOS V for the purpose of wavefront analysis. The authors have recently attached MCI to LOTS, so that the wavefront analysis would consider the effects of diffraction through a small aperture. As an application of LOTS-MCI, the authors performed the present study of beam clean-up. LOTS's input language allows the user to impose third order aberrations on a beam at any location in the beam path. The aberrations may be given arbitrary orientation. LOTS then propagates the beam to a focus in these examples, where the user may place an aperture of arbitrary diameter. The light passing through the aperture is propagated to the far field, and the wavefront data is passed to MCI for the calculation of wavefront information. (5 refs.)

112925 Bases and applications of the induced resonance absorption. I. H.Pohlack (VEB Carl Zeiss Jena, Jena, Germany). *Feingeraetetechnik (Germany)*, vol.32, no.7, p.321-6 (1983). In German. The induced resonance absorption—an optical interference effect in thin absorbing films—is presented. The parameter conditions for the fundamental modes are developed. Applications of the effect in photothermal and photovoltaic energy conversion processes are explained. (31 refs.)

112926 Encircled energy of diffracted covering spherical waves. Yajun Li (Inst. für Nachrichtentech., Tech. Univ. München, München, Germany). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1101-4 (Sept. 1983). The author studied the diffraction phenomenon of a circular aperture that was illuminated by a monochromatic converging spherical wave. The theoretical part of this study was based on the scalar Huygens-Fresnel integral. In the experiments the author used a circular detector centered on-axis to measure the encircled energy. The author varied both the radius and the longitudinal position of the detector. The principal maximum of the encircled energy received by the detector was usually not in the geometrical focal plane, and its position changed abruptly when the radius of the detector was varied. These abrupt changes look like sawtooth variations, which are superimposed upon a slowly changing curve. The author's experiments were in a good agreement with calculations. (12 refs.)

112927 Three-dimensional vector coupled-wave analysis of planar-grating diffraction. M.G.Moharam, T.K.Gaylord (School of Electrical Engng., Georgia Inst. of Technol., Atlanta, GA, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1105-12 (Sept. 1983). Diffraction by an arbitrarily oriented planar grating with slanted fringes is analyzed using rigorous three-dimensional vector coupled-wave analysis. The method applies to any sinusoidal or nonsinusoidal amplitude and/or phase grating, any plane-wave angle of incidence, and any linear polarization. In the resulting (conical) diffraction, it is shown that coupling exists between all space-harmonic vector fields inside the grating (corresponding to diffracted orders outside the grating). Therefore the TE and TM components of an incident wave are each coupled to all the TE and TM components of all the forward- and backward-diffracted waves. For a general Bragg angle of incidence it is shown that the diffraction efficiency can approach 100% for a lossless grating if either the incident electric field or the magnetic field is perpendicular to the grating vector. Maximum coupling between incident and diffracted waves is shown to occur when the incident electric field is perpendicular to the grating vector. In general, the diffracted waves are shown to be elliptically polarized. The three-dimensional vector coupled-wave analysis presented is shown to reduce to ordinary rigorous coupled-wave theory when the grating vector lies in the plane of incidence. (31 refs.)

- 112928 Paraxial ray paths in spherical gradient-index media.** T.Sakamoto (Industrial Lab. of Hyogo Prefecture, Suma, Kobe, Japan). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1209-10 (Sept. 1983). Paraxial ray paths are derived for spherical gradient-index media whose index distributions are expressed as infinite even-power series of the distance from the center. (3 refs.)
- 112929 Explicit equations for the second Brewster angle of an interface between a transparent and an absorbing medium.** R.M.A.Azzam (Dept. of Electrical Engng., Univ. of New Orleans, Lakefront, New Orleans, LA, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1211-12 (Sept. 1983). The second Brewster angle ϕ_{B2} , at which the ratio R_p/R_s of intensity reflectances R_p and R_s for the parallel (p) and the perpendicular (s) polarizations of a dielectric-conductor interface reaches a minimum, is determined by $\text{Im}[(u-\epsilon)(u-\bar{\epsilon})^2/(u-2\bar{\epsilon})^2]=0$, where ϵ is the complex ratio of dielectric constants of the media of refraction and incidence, $\bar{\epsilon}=\epsilon/(\epsilon+1)$, and $u=\sin^2\phi_{B2}$. An equivalent quartic equation in u is also derived that can be solved exactly and explicitly to determine ϕ_{B2} in terms of ϵ . (7 refs.)
- 112930 Reflection of a linearly polarized plane wave from a lossless stratified mirror in the presence of a phase-conjugate mirror.** A.T.Friberg, P.D.Drummond (Dept. of Phys. & Astron., Univ. of Rochester, Rochester, NY, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1216-19 (Sept. 1983). Reflection of a linearly polarized electromagnetic plane wave from an ordinary lossless stratified plane mirror is analyzed in the presence of a phase-conjugate mirror. It is shown that, if the conjugated waves are generated without losses or gains and also without a change in the state of polarization, the specularly reflected wave will be extinguished completely and a phase-conjugated replica of the incident wave will be formed. This result, which clearly illustrates a recently derived general theorem on phase conjugation, is independent of the reflectivity of the ordinary mirror and the separation between the two mirrors. New results for arbitrary reflectivities are also obtained. (10 refs.)
- 112931 Scattering of circularly polarized radiation.** I.Tinoco, Jr., D.Keller (Dept. of Chem., Univ. of California, Berkeley, CA, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2915-17 (21 July 1983). The differential refraction and absorption of circularly polarized light was applied by Henry Eyring and co-workers to study the configuration and conformation of small molecules. The differential scattering as a function of angle of circularly polarized light can provide structural information about large scattering systems. The authors present the general equations relating circular differential scattering to the eigenfunctions of a scatterer which is of arbitrary size relative to the wavelength of light. An equivalent experiment is to measure the ellipticity of the scattered light when linearly polarized light is incident. (17 refs.)
- 112932 Validity conditions of the thickness function method for determining the transmittance function.** C.Gomez-Reino (Dept. de Fisica Fundamental (Optica), Santiago, Univ. de Santiago de Compostela, Spain), E.Larrea. *Lett. Nuovo Cimento (Italy)*, vol.38, ser.2, no.1, p.11-15 (3 Sept. 1983). Validity conditions of the thickness function method for determining the transmittance function are obtained by a general method developed by the authors (1982). (5 refs.)
- 112933 Theory of radiation in media with changing anisotropy.** V.A.Davydov (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.94-7 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.79-82 (1983). The radiation of a charge moving in a crystal with periodic change in direction of the optical axis over time is considered. Polarizational, angular, and spectral characteristics of the radiation are obtained and investigated. (4 refs.)
- 112934 Determination of small double refractions of plane-parallel glass plates.** H.Melle (Phys.-Tech. Bundesanstalt, Braunschweig, Germany). *Optik (Germany)*, vol.65, no.2, p.115-22 (1983). In German. The modification of the vibration azimuth of a linearly polarized coherent light wave passing through plane-parallel glass plates is treated experimentally and theoretically. Due to insignificant residual double refractions, real glass plates show a marked influence on the vibration azimuth of the transmitted wave. This results in a new method of measuring double refractions in a simple and exact way. (2 refs.)
- 112935 Reciprocity relations with partially coherent sources.** A.T.Friberg (Dept. of Tech. Phys., Helsinki Univ. of Technol., Espoo, Finland), E.Wolf. *Opt. Acta (GB)*, vol.30, no.10, p.1417-35 (Oct. 1983). Two general reciprocity relations are formulated, relating to planar sources of any state of spatial coherence and the radiation fields they generate. One of them expresses a reciprocity between the effective coherence area of the source and the effective angular spread of the radiation. The other expresses a reciprocity between the effective intensity spread across the source and the effective angular domain subtended at the source by the coherence area of the far field. Two well-known reciprocity relations associated with coherent and incoherent sources are obtained as special cases. The general reciprocity relations take a particularly simple form when the source is quasi-homogeneous. (32 refs.)
- 112936 Reciprocity principles for focused wavefields and the modified Debye integral.** H.M.Pedersen, J.J.Stamnes (Central Inst. for Industrial Res., Oslo, Norway). *Opt. Acta (GB)*, vol.30, no.10, p.1437-54 (Oct. 1983). It is shown that focused wavefields satisfy a reciprocity principle concerning the roles of the focal point and the observation point. According to this principle, the diffracted field at a point P_2 of a converging spherical wave centred on the focal point P_1 is the complex conjugate of the diffracted field observed at P_1 if the focal point is at P_2 . The commonly used Debye integral representation of focused wavefields violates the reciprocity principle. Therefore the authors derive a new diffraction formula for focused wavefields which the authors call the modified Debye integral (MDI). It is constructed so as to satisfy the reciprocity principle, and may be considered as a generalization of the Debye integral and also as a refinement on a diffraction integral derived by Hopkins. For focusing of a two-dimensional perfect wave the authors show that the MDI gives the same f -number dependent parabolic phase factor on the geometrical focal line as is obtained numerically in the Kirchhoff approximation. For focusing of three-dimensional waves the MDI and the Kirchhoff theory are shown to predict the same focal shift in the paraxial approximation, as long as the shift is small compared with the focal distance. (31 refs.)
- 112937 Absorption of conical load with diffuse reflection of internal surface.** V.M.Kuz'michev, E.Ya.Govorun. *Radiotekhnika, Kharkov (USSR)*, no.61, p.82-8 (1982). In Russian. [received: Aug. 1983] A multiple reflection method, which takes into account the distribution of the energy after each reflection, is proposed for calculating the absorption of the

optical emission in conical loads with diffuse reflection of the internal surface. Expressions are derived for the absorptive power of the loads as a function of the coefficient of reflection and the semiflare angle of the cone, of the derived radius of the homogeneous axial beam and of the point of impact of the narrow beam onto the flare of the cone. The results of the numerical calculations are compared with the data obtained by other writers. (5 refs.) L.M.H.

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

- 112938 Coherent detection of scattered light from submicron aerosols.** D.R.Petit, T.W.Peterson (Dept. of Chem. Engng., Univ. of Arizona, Tucson, AZ, USA). *Aerosol Sci. & Technol. (USA)*, vol.2, no.3, p.351-68 (1983). The van Cittert-Zenike theorem states that light scattered from small particles can be made coherent if gathered at the focal point of a lens. Coherent-detection techniques can then be used to measure the extent of the phase shift due to the particles. Scattering mechanisms can relate the phase shift to the particle diameter, so particle size can be determined. Theoretical estimates of the ideal minimum detectable particle diameters are of the order of $5 \times 10^{-3} \mu\text{m}$; estimates of the minimum detectable diameters for a practical system are of the order of $5 \times 10^{-2} \mu\text{m}$. Particles are counted one at a time as they travel through an optically defined view to volume. Electronic signal processing allows particle size distributions to be deduced from the individual signals. The sampling of particle concentrations up to $10^9/\text{cm}^3$ is possible with this technique. The coherent optical particle spectrometer can be used to measure aerosol dynamics in high-temperature environments and to determine the properties of single submicron particles. (42 refs.)
- 112939 Onefold photoelectron-counting statistics for non-Gaussian light: scattering from an arbitrary number of weak scatterers.** R.Barakat (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1138-42 (Sept. 1983). The onefold photoelectron-counting statistics (e.g. probability distribution and moments) are obtained when the physical system under study contains an arbitrary number of independent weak (i.e. nonuniform phase) scatterers. The results are generalized by letting the number of scatterers be random and be governed by a Poisson distribution. (11 refs.)
- 112940 Stationarity of speckle in laser refraction.** R.D.Bahuguna, D.Malacara (Centro de Investigaciones en Optica, AC, Leon, Mexico). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1213-15 (Sept. 1983). The equation that describes the tangential focal conditions for a curved grating is found to be a natural solution for the position of the plane of stationarity in laser refraction. It is found that the imaging equation of the macroscopic surface treated as a mirror is a particular solution when (1) the observation is in the specular direction or (2) the incidence and observation directions are close to the normal to the surface. When speckle is viewed in this way, some errors in previous research on speckle motion are brought to light. (17 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

- 112941 Image restoration for a defocused optical system.** L.R.Berriel, J.Bescos (Inst. de Optica, Madrid, Spain), A.Santesteban. *Appl. Opt. (USA)*, vol.22, no.18, p.2772-80 (15 Sept. 1983). Images obtained by an aberration-free system are digitally defocused with progressive values of defocusing. Wiener filtering restoration is applied to the defocused images, and the defocusing range for effective restoration is shown. The stability of the filters for restoring images with spatially variant defocusing is also discussed. (4 refs.)
- 112942 Image restoration by convex projections in the presence of noise.** M.I.Sezan, H.Stark (Dept. of Electrical, Computer & Systems Engng., Rensselaer Polytech. Inst., Troy, NY, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2781-9 (15 Sept. 1983). In this paper the authors investigate how the method of convex projections for image restoration behaves in the presence of noise. The authors also introduce and test a new noise-smoothing procedure in which the restored image is forced to lie within a certain L_2 distance of the noisy data. The authors show that, in the presence of noise, restoration by convex projections is superior to the Gerchberg-Papoulis method. (15 refs.)
- 112943 Simplified calculation of the effects of jitter on clutter leakage.** N.G.Kulgein (Electro-Optics Lab., Lockheed Palo Alto Labs., Palo Alto, CA, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2794-7 (15 Sept. 1983). A simple analytical solution has been found that enables prediction of the effects of line-of-sight motion of a sensor on clutter leakage after first differencing. The effect of finite footprint size is included, and the crucial importance of the ratio of this quantity to the background correlation length is given. For small motions the clutter leakage as a fraction of the value of background standard deviation is given by the very simple formula $\sqrt{2[1 - \exp(-L/D)]}$, where L is the footprint size, and d is the background correlation length. (5 refs.)
- 112944 Statistical performance of the circular harmonic filter for rotation-invariant pattern recognition.** Yuan-Neng Hsu, H.H.Arsenault (Dept. de Phys., Lab. de Recherches en Optique et Laser, Univ. Laval, Quebec, Canada). *Appl. Opt. (USA)*, vol.22, no.18, p.2804-9 (15 Sept. 1983). Circular harmonic filters of different orders are compared using a criterion of separability between the target and object output probability densities. A holographic computer-generated circular harmonic filter was used to recognize aircraft from an air photograph. (9 refs.)
- 112945 Image-based focusing.** T.Selker (Computer Sci. Dept., Stanford Univ., Stanford, CA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.360, p.96-9 (1982). [received: July 1983] (Robotics and Industrial Inspection, San Diego, CA, USA, 24-27 Aug. 1982). Lens focusing using a hardware model of a retina (Reticon RL256 light sensitive array) with a low cost processor (8085 with 512 bytes of ROM and 512 bytes of RAM) was built. This system was developed and tested on a variety of visual stimuli to demonstrate that: a) an algorithm which moves a lens to maximize the sum of the difference of light level on adjacent light sensors will converge to best focus in all but contrived situations. This is a simpler algorithm than any previously suggested; b) it is feasible to use unmodified video sensor arrays with inexpensive processors to aid video camera use. In the future, software could be developed to extend the processor's usefulness, possibly to track an actor by panning and zooming to give a camera operator increased ease of framing; c) lateral inhibition is an adequate basis for determining best focus. This supports a simple anatomically motivated model of how the brain focuses the eyes. (5 refs.)
- 112946 Minimum variance estimation of wavefront aberration.** G.S.Um (Rockwell Internat., Seal Beach, CA, USA), B.F.Smithgall, C.L.O'Bryan. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.351, p.96-102 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982). Presents an image-based indirect wavefront aberration estimation which is noise optimal. The minimum variance estimation is obtained by linearising the focal plane intensity distribution in terms of the aberration parameters and a known set of derivatives of the point spread function. The technique was also made to work successfully for unknown extended sources by Fourier transforming the image to the frequency space. The results obtained from a computer simulation show excellent noise rejection. With a signal-to-noise ratio of 5, the wavefront correction is achieved down to 0.1 λ . In some cases, this method worked when the initial signal-to-noise ratio was less than one. Since the estimation is performed with a linear approximation, the dynamic range of operation was found to be limited to 0.35 RMS λ . (8 refs.)
- 112947 Optical image processing in coherent and incoherent light: a short comparative review.** P.Chavel (Inst. d'Optique, Univ. de Paris-Sud, Orsay, France). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.442-9 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982). In recent years, a number of methods have been developed to overcome the limitations of the classical coherent and incoherent image processing methods. A review of the main trends in this area is presented, indicating the principles of low-noise coherent processing, of incoherent processing of complex quantities and of white light processing; it is seen that optical processing can now in a number of cases perform nonlinear operations, or shift invariant operations while still keeping the advantage of parallelism. (52 refs.)
- 112948 Thermal aspects of magneto-optical recording.** M.Mansuripur, G.A.N.Connell (Xerox Palo Alto Res. Center, Palo Alto, CA, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.4794-8 (Sept. 1983). Discusses the influence of thermal response on the magneto-optic readout performance of optically similar but thermally different quadrilayer media, using newly developed computational techniques for examining laser-induced heat flow in moving multilayer media. They first emphasize the importance of

- time scale for differentiating the write and read processes. They then show that the optimum design is a function of the medium velocity and available laser power for writing and is not normally one that provides maximum signal-to-noise ratio in the limit that laser heating during readout can be ignored. Finally, the authors describe a systematic approach to the selection of the best quadrilayer design for a given set of system conditions. (10 refs.)
- 112949 Ablative optical recording using organic dye-in-polymer thin films: some mechanistic aspects.** Kock-Yee Law, G.E.Johnson (Xerox Webster Res. Center, Webster, NY, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.4799-805 (Sept. 1983). The influence of a number of materials properties and device structure variations on the energy threshold for laser marking of organic dye-in-polymer films has been investigated. The author's results indicate that the write-sensitivity of these organic dye-in-polymer optical recording media is strongly dependent on the absorption efficiency of the recording film, the quantum efficiency of generation of thermal energy by the dye and the recording film thickness for films > 100 nm. The write-sensitivity is however, not dependent on the glass transition temperature, the surface tension or the melt viscosity of the polymer binder. This independence is attributed to the very rapid nature of the mark formation process. The technological implications of the present work are discussed. (20 refs.)
- 112950 Subcoded information carriers: hybrid moire system.** R.Eschbach, O.Bryndahl (Dept. of Phys., Univ. of Essen, Essen, Germany). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1123-9 (Sept. 1983). Investigation and application of subcoded information carriers are discussed. Sequences of orthogonal states introduce basic systems that allow for parallel processing in the spatial domain. Moire simulation experiments illustrate some peculiarities of the coding and decoding procedures. Characteristic features achievable by using subcoded carriers are sign determination of displayed variations, phase multiplication, and improved signal-to-noise ratio. A hybrid version of a moire test method is described to show the flexibility and filtering possibilities when orthogonal subcodes are used under realistic conditions. (11 refs.)
- 112951 Fast algorithm for the computation of the zero-order Hankel transform.** P.K.Murphy, N.C.Gallagher (Purdue Univ., West Lafayette, IN, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1130-7 (Sept. 1983). The Hankel transform may be defined as the two-dimensional Fourier transform of a circularly symmetric function. A new Hankel-transform algorithm based on this definition is described. The proposed algorithm efficiently generates a rectangularly sampled two-dimensional output array by using the circular symmetry properties of the input array and two-dimensional vector radix fast-Fourier transform techniques. It accomplishes this by partitioning the input matrix into smaller and smaller processing blocks while removing redundant blocks from data manipulations. For applications that require the output data to be sampled on a two-dimensional rectangular raster, the convenience and the computational speed of the resulting algorithm offer advantages over the one-dimensional Hankel-transform algorithms currently available. (9 refs.)
- 112952 Fifth-order aberration theory of gradient-index optics.** S.D.Fantone (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1149-61 (Sept. 1983). The fifth-order aberration coefficients for gradient-index lenses are presented. A procedure for calculation is outlined. (5 refs.)
- 112953 Fifth-order aberration theory of gradient-index optics—examples.** S.D.Fantone (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1162-4 (Sept. 1983). Four examples are presented as verification of the validity and the usefulness of the equations derived earlier (see *ibid.*, vol.73, p.1149, 1983). In each example, the aberration coefficients derived by algebraic methods are compared with those obtained from ray-trace data to a seventh-order aberration polynomial including ninth-order spherical aberration and distortion. In all cases good agreement is obtained between the two methods. (3 refs.)
- 112954 Self-imaging through a Fabry-Perot interferometer.** G.Indebetouw (Phys. Dept., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Opt. Acta (GB)*, vol.30, no.10, p.1463-71 (Oct. 1983). The spatial filtering property of a Fabry-Perot interferometer is shown to transform the spatial spectrum of an arbitrary image into a form which satisfies, approximately, the conditions for self-imaging. The limitations of the technique are studied and checked experimentally. (4 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

- 112955 Low-noise multicolor archival storage with broad source interferometric imaging.** Hsuan Chen, Y.S.Cheng (Univ. of Michigan, Ann Arbor, MI, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2790-3 (15 Sept. 1983).
A low-noise true color image plane rainbow hologram is formed with a modified Mach-Zehnder interferometer using an extended source. Experiments show excellent results in the noise suppression and resolution preservation capabilities of this system. (5 refs.)
- 112956 Image formation by multifacet holograms.** P.R.Haugen, H.Bartelt, S.K.Case (Electrical Engng. Dept., Univ. of Minnesota, Minneapolis, MN, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2822-9 (15 Sept. 1983).
A method is described in which arbitrary images are formed via Fresnel diffraction. In this method, a multifacet hologram is used to deflect small square areas of light from a given spatial location in the input plane to an arbitrarily prescribed location in the output plane, producing an image composed of small square patches of light. Five different variations of multifaceted holography are presented. Volume phase holograms are used in the deflection process resulting in nearly 100% efficiency. (11 refs.)
- 112957 Gaussian beam effects in far-field in-line holography.** C.S.Vikram (Pennsylvania State Univ., University Park, PA, USA), M.L.Billet. *Appl. Opt. (USA)*, vol.22, no.18, p.2830-5 (15 Sept. 1983).
Far-field in-line holography has been studied in detail when one or both of the beams used for recording and reconstruction are Gaussian. The contrast of the high frequency interference fringes and hence their recordability have been investigated with a specific example of the object having circular cross section. For reconstruction the effects of uniform as well as Gaussian beams are studied and compared. (15 refs.)
- 112958 Computer-generated holograms in biology and medicine.** R.J.Perlmutter (Stanford Univ., Stanford, CA, USA), S.S.Friedland. *IEEE Comput. Graphics & Appl. (USA)*, vol.3, no.5, p.47-51 (Aug. 1983).
Shows how holographic images of diagnostic scan data can be invaluable in many medical procedures. A method is described, which makes possible the efficient computer generation of holograms. (9 refs.)
- 112959 Coherent image amplification and optical phase conjugation with photorefractive materials.** P.Gunter (Lab. of Solid State Phys., Swiss Federal Inst. of Technol., Zurich, Switzerland). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.230-6 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The electric field and fringe spacing dependence of the stationary energy transfer between two writing beams in volume phase-hologram formation with photoconductive electro-optic materials ($\text{KNbO}_3\text{:Fe}^{2+}$, $\text{Bi}_{12}(\text{Si,Ge})\text{O}_{20}$,...) has been studied. Experimental results are compared with the theoretical expressions describing the influence of the different photoinduced spacecharge fields in photorefractive media. A peak exponential gain of $\Gamma=15\text{ cm}^{-1}$ has been reached in $\text{KNbO}_3\text{:Fe}^{2+}$ for the proper choice of experimental parameters such as recording wavelength fringe spacing, applied electric field, etc. Results of the electric field dependence of the wavefront reflectivity ρ in degenerate four-wave mixing experiments are reported and discussed in terms of a similar theoretical treatment as the two-wave mixing experiments. It is shown, that peak reflectivities of $\rho=25$ percent have been reached for $\text{KNbO}_3\text{:Fe}^{2+}$, that conjugate complex wavefronts can be generated and that distorted optical wave-fronts can be effectively corrected by four-wave mixing experiments in $\text{KNbO}_3\text{:Fe}^{2+}$. (12 refs.)

112960 High-frequency holographic transmission gratings in photoresist. R.C.Enger, S.K.Case (Dept. of Electrical Engng., Univ. of Minnesota, Minneapolis, MN, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1113-18 (Sept. 1983).
This paper describes an experimental study of the diffraction properties of high-spatial-frequency gratings recorded in relatively thin photoresist layers. Angular selectivity, wavelength selectivity and peak efficiencies are investigated. Details on grating fabrication are given. The study shows that optical elements with efficiencies greater than 88% can be recorded in media less than one wavelength thick ($\sim 0.5\text{ }\mu\text{m}$ for our visible-light experiments). The results are important in that such diffractive structures could be replicated by embossing, chemical-vapor deposition, or other means. (15 refs.)

112961 Recording a binary computer-generated hologram on a thermoplastic film. T.Minemoto, T.Nonami (Dept. of Instrumentation Engng., Kobe Univ., Kobe, Japan). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.97-100 (15 Aug. 1983).
A computer-generated hologram was recorded on a thermoplastic film using an electron-beam recording device. The hologram was a binary one of detour phase type and of surface relief type. A bright image was reconstructed from the recorded hologram. (4 refs.)

112962 High-sensitivity material with reversible photo-induced anisotropy [holographic recording]. T.Todorov, N.Tomova, L.Nikolova (Central Lab. of Optical Storage & Processing of Information, Bulgarian Acad. of Sci., Sofia, Bulgaria). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.123-6 (15 Aug. 1983).
A new high-sensitivity material with reversible photo-induced anisotropy, suitable for real-time recording, is investigated. The material (methyl-red dye introduced in a polymer layer) requires low recording intensities (tens of mW cm^{-2}) and possesses excellent reusability. (10 refs.)

112963 Volume-type multiple hologram memory using PMMA thick films. Jon-Chi Chang, T.Okoshi (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan)*, vol.J66C, no.7, p.505-12 (July 1983). In Japanese.
The characteristics of polymethyl methacrylate (PMMA) sensitized by *p*-benzoquinone at $\lambda=488\text{ nm}$ as a volume-type phase hologram memory material are investigated. Dynamic coupled-wave theory considering the saturation behavior of the PMMA material is used to describe the measured exposure characteristics of PMMA hologram gratings. A particle model is assumed to construct an optimum design theory of the hologram using PMMA thick films, and the optimum design parameters and maximum storage density of such hologram memories have been calculated. Experiments on a multiple-exposure hologram memory have been performed using the design parameters obtained, achieving a storage density of $(0.2\sim 1.5)\times 10^6\text{ bit/mm}^2$. (14 refs.)

112964 Quasi-one-dimensional volume-type hologram memory. Jon-Chi Chang, T.Okoshi (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan)*, vol.J66C, no.7, p.513-20 (July 1983). In Japanese.
A volume-type hologram memory featuring a strip-shaped information composer (quasi-one-dimensional hologram memory) is proposed. The advantage is that the spatial modulator and the photodiode array can easily be constructed even when the writing and reading wavelengths are different. The design criteria are discussed. Experimental results are shown. A storage density of $(0.3\sim 1.0)\times 10^5\text{ bit/mm}^2$ has been realized by using a PMMA (polymethyl methacrylate) thick film with $400\text{ }\mu\text{m}$ thickness. (7 refs.)

112965 The optical target. A new five dimensional transducer using laser holography. Ye Sheng-Hua, Xu Ring-Ting, Wei Shang-Chen (Dept. of Precision Instruments Engng., Tianjin Univ., Tianjin, China).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.219-27 vol.1.
The fundamental principle of a five dimensional transducer of laser holographic light splitting is presented including a brief mathematical analysis. This kind of multi-dimensional transducer can be used both in production and in scientific research, especially for calibration of balance for sensing the force and movement of force from various directions in aerodynamics. 42.50 QUANTUM OPTICS

112966 Propagation, transverse and diffraction effects and coherent pump dynamics in three-level superfluorescence and light control by light. F.P.Mattar (Aerodynamics Lab., Polytech. Inst. of New York, NY, USA), C.M.Bowden. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.245-52 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Calculational results and analysis are presented and discussed for the effects of coherent pump dynamics, propagation, transverse and diffraction effects on superfluorescent (SR) emission from an optically-pumped three-level system. The full, copropagational aspects of the injected pump pulse together with the SF which evolves are explicitly treated in the calculation. It is shown that the injection pulse initial characteristics can have a strong effect on the SF emission. (20 refs.)

112967 Reflection of light by an inhomogeneous inversion medium with dispersion. A.B.Zimin, N.S.Petrov. *J. Appl. Spectrosc. (USA)*, vol.37, no.5, p.1322-7 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.843-9 (Nov. 1982). [received: Sept. 1983] (14 refs.)

112968 Resonant transitional scattering in vacuum in the presence of an external electromagnetic field. V.R.Khalilov (Dept. of Theoretical Phys., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.105-7 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.88-90 (1983).
The probability of scattering (in time τ) of a strong, circularly polarized, electromagnetic wave with frequency doubling, propagating in vacuum in a periodic (in space) external electroamgnetic field under definite conditions, is proportional to τ^2 . (5 refs.)

112969 Collisionless cyclotron absorption of photons by electrons in a laser beam. M.B.S.Lima, C.A.S.Lima (Inst. de Fisica, Univ. Estadual de Campinas, Sao Paulo, Brazil), L.C.M.Miranda. *Opt. Acta (GB)*, vol.30, no.10, p.1359-62 (Oct. 1983).
Charged particle acceleration in a laser beam with a superimposed cyclotron motion is considered. The energy absorption process is analysed using an exact quantum mechanical description of the particle motion. The results permit a simple quantum mechanical interpretation of energy absorption under a cyclotron resonance regime. (8 refs.)

112970 Classical statistical mechanics of a lattice model of superradiance. V.Benza, E.Montaldi (Dipartimento di Fisica, Univ. di Milano, Milan, Italy).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.231-4 (5 Sept. 1983).

A classical model of the interaction of N two-level atoms with the radiation field discretized on a lattice, having particular relevance for superradiance, is discussed. By evaluating the corresponding partition function the threshold condition for the occurrence of a second-order phase transition is derived. A comparison with previous work, where a finite number of field modes was considered, is also given. (7 refs.)

Coherent light scattering from ruby dressed with RF photons

42.52 MASERS

112971 Comment on 'Stimulated bremsstrahlung masers'. Y.Ben-Aryeh, J.Felsteiner, J.Politch, A.Rosenberg (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel), A.J.Palmer.

Appl. Phys. Lett. (USA), vol.43, no.6, p.614-15 (15 Sept. 1983). For original paper see A.J. Palmer, *ibid.*, vol.42, p.1011 (1983). Presents a proper interpretation of Palmer's experiments in which he tried to get evidence of amplification or oscillation produced by stimulated bremsstrahlung in an open resonator which encloses a glow discharge plasma. The authors maintain that Palmer disregarded important differences in the experimental conditions. A reply by Palmer is included. (11 refs.)

112972 Analysis of the Majorana transition and beam optics for the state selection of a hydrogen maser. S.Urabe, Y.Ohta (Radio Res. Labs., Ministry of Posts & Telecommunications, Tokyo, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1009-16 (June 1983). The Majorana transition and the beam optics configuration are analysed for the purpose of designing the hydrogen maser state selector which selects only desired atoms for oscillation. In this state selection, the double focalization method and the Majorana transitions which reverse the atomic polarization are used in order to eliminate undesirable atoms. The polarization reversal is obtained by calculating the transition probabilities of the atomic spin in the reverse magnetic field. The beam optics configuration is also analysed for the purpose of effective elimination. Based on these analyses, the state selection is successfully attained, and about 90% of the undesirable atoms are eliminated. (11 refs.)

112973 Ion neutralization in helical electron beams. V.A.Varentsov, Sh.E.Tsimring (Inst. of Appl. Phys., Acad. of Sci., Gor'kii, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.163-6 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.264-9 (Feb. 1983). [received: Sept. 1983]

Space-charge neutralization is studied in intense helical beams produced by cyclotron resonance masers. The beams are produced by magnetron injection guns together with particles formed by ionization of residual gases. The experimental findings indicate the ion neutralization causes the average gyration velocity and velocity spread to become almost identical to the values observed at small currents. An analysis of pulse measurements indicates that the space charge field causes the regions of velocity spreading to be localized. The consequences of ion neutralization can be exploited in intense helical beam diagnostics. (10 refs.)

112974 Cyclotron-autoresonance maser with a wavelength of 2.4 mm. I.E.Botvinnik, V.L.Bratman, A.B.Volkov, G.G.Denisov, B.D.Kol'chugin, M.M.Ofitserov (Inst. of Appl. Phys., Acad. of Sci., Gorki, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.596-7 (Nov. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1386-9 (Nov. 1982). [received: Sept. 1983]

The cyclotron-autoresonance maser (CARM) is predicted to be one of the most promising relativistic millimeter and submillimeter-wave sources. The authors report a 2-mm source which uses $H_{1,1}$ as the working mode. The experiments were carried out with the Neptun-2 high-current accelerator, which produces an electron beam with a pulse length of 100 ns, an energy adjustable over the range 500-600 keV, and a current adjustable over the range 0.3-1.5 kA. (9 refs.)

Four-centimeter traveling-wave maser with high amplitude and phase stability [radioastronomy application]

42.55 LASING PROCESSES

42.55B General theory of lasing action

112975 Nonequilibrium kinetics of coupled photons and electrons in two-level systems of the laser type. E.Scholl (Inst. für Theoretische Phys. B, RWTH Aachen, Aachen, Germany), P.T.Landsberg.

J. Opt. Soc. Am. (USA), vol.73, no.9, p.1197-206 (Sept. 1983). Rate equations for photons and for electrons in systems of two groups of energy levels (energy separation kT_0) are set up allowing for absorption, stimulated and spontaneous emission, nonradiative transitions, photon loss or dissipation as well as photon gain from the ambient, and an externally applied pumping rate. The rate equations are discussed qualitatively, and the stability of the solutions is obtained by the use of phase portraits. The quantitative discussion includes steady-state photon distributions. Earlier work showing that these distributions can obey the Bose-Einstein law with a nonzero chemical potential kT is taken into the laser regime, which was not covered by recent relevant work. The second-order phase transition that occurs at threshold is established explicitly, and it is shown that the transition requires one to neglect certain generation terms in the rate equations. Some time-dependent solutions of the rate equations are also discussed, using the slaving principle of adiabatic elimination for the electrons. The application of this work to semiconductors is discussed. (28 refs.)

112976 Generation of short laser pulses during coherent amplification. A.V.Nazarkin, I.A.Poluektov, I.I.Sobel'man (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

JETP Lett. (USA), vol.37, no.7, p.371-5 (5 April 1983). Translation of: *Pisma v Zh. Eksp. & Teor. Fiz. (USSR)*, vol.37, no.7, p.313-16 (5 April 1983). [received: Oct. 1983]

Laser pulses can be frequency-converted by an π -pulse technique with a high energy efficiency and with a substantial reduction in length. (3 refs.)

112977 Bifurcation of solutions of the laser equations. M.Renardy (Math. Res. Center, Univ. of Wisconsin, Madison, WI, USA), H.Haken.

Physica D (Netherlands), vol.8D, no.1-2, p.57-89 (July 1983). The authors prove the existence and stability of bifurcating periodic and quasiperiodic solutions of the equations describing a ring laser. (29 refs.)

112978 Use of the method of ordered operators in the theory of laser systems. Derivation asymptotically exact equations for radiation. I. G.O.Balabanyan (Moscow Inst. of Electronic Engng., Moscow, USSR).

Theor. & Math. Phys. (USA), vol.54, no.1, p.82-92 (Jan. 1983). Translation of: *Teor. & Mat. Fiz. (USSR)*, vol.54, no.1, p.130-46 (Jan. 1983). [received: Sept. 1983]

In the framework of Dicke type models, a theory of laser radiation of two-level systems is constructed. The theory uses the method of ordered operators, which makes it possible to eliminate the atomic variables and obtain an asymptotically exact (in the sense of the thermodynamic limit) hierarchy of equations for the mean values, which depend only on the variables of the radiation. The author also considers the derivation of kinetic equations describing the radiation. (17 refs.)

Stability of a detuned single mode homogeneously broadened ring laser

42.55F Inert gas lasers

112980 The investigation on low noise discharge tubes in short single-mode He-Ne/CH₄ lasers. K.M.Abramski (Inst. of Telecommunication & Acoustics, Tech. Univ. of Wrocław, Wrocław, Poland).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1068 (June 1983).

The frequency-stabilized He-Ne/CH₄ laser requires a stable radiation to be interacted with the absorber. One of the problems of frequency instability minimalization is to suppress the laser tube noise. The author investigated the noise properties in three types of laser tubes: an ordinary tube, a tube with spacing between capillary elements, as proposed by Suzuki (1970) and a tube with spherical spacing as proposed by Koshelyaevskii et al. (1972). The construction by Suzuki exhibited the best properties for the low noise region close to 2.1 Tr pressure. The tube with the spherical spacing, however, shows a higher threshold of random noise. Both constructions prove to be much better than the ordinary tube. (4 refs.)

112981 Estimated lifetime of an H microwave-pumped laser using a spectroscopic method. A.P.Golovitskii, V.A.Kruzhvalov, T.M.Perchanok (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.171-3 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.278-81 (Feb. 1983). [received: Sept. 1983]

He-Ne laser efficiencies can be increased by using microwave excitation, as opposed to pumping by a constant-current discharge. To estimate the lifetime of the microwave-pumped laser the gas composition and pressure were monitored spectroscopically. Calibration curves were obtained by studying how the intensity of a series of spectral lines depended on the pressure and composition of the mixture. While recording the calibration curves the authors also determined the range of pressures and mixture compositions at which lasing is observed at $\lambda=632.8$ nm with power comparable to that needed for lasing using a constant-current discharge. It was noted that the efficiency of the microwave-pumped laser was 3-5 times higher than for a constant-current discharge laser at comparable laser powers. (11 refs.)

112982 Gain on the green (504 nm) excimer band of I₂. K.P.Killeen, J.G.Eden (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.539-41 (15 Sept. 1983).

Gain on the green excimer band ($\lambda \sim 504$ nm) of the iodine dimer has been observed in electron-beam-pumped mixture of Ar (or Ne), and hydrogen iodide. A peak gain coefficient of $\gamma > 1.1\%$ cm⁻¹ is measured at 506 nm with a tunable dye laser and the full width at half-maximum (FWHM) of the gain spectrum in Ar diluent is 13 nm. Temporally resolved gain and fluorescence measurements show that the green emission originates from an I₂ ion pair state other than D'. However, strong collisional coupling between the upper states of the UV ($\lambda=342$ nm) and green bands and superfluorescence on the UV band ($1_{3/2} \sim 2$ MW cm⁻²) appear to limit the green gain coefficient to <20% of its small-signal value. Consequently, suppression of superfluorescence on the UV D' \rightarrow A' bands of the homonuclear halogens should lead to a new family of excimer lasers with wavelengths extending from the green in the ultraviolet. (16 refs.)

112983 Relative efficiency of ²⁰⁰Hg ⁷⁹Br, Hg ⁷⁹Br, and HgBr electric discharge lasers. F.E.Hanson, H.Rieger, D.B.Cavanaugh (Naval Ocean Systems Center, San Diego, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.7, p.622-3 (1 Oct. 1983).

The spectra and relative efficiency of ²⁰⁰Hg ⁷⁹Br, Hg ⁷⁹Br, and HgBr in a small UV preionized electric discharge laser have been measured. There is a similar improvement in laser energy for both isotopic samples compared to the natural abundance mixture which can be attributed to a narrower gain spectrum and consequent higher peak gain. At the highest output measured, the increase in laser energy was about 25%. The authors estimate this is due to roughly 15% increase in small-signal gain. (10 refs.)

112984 Analysis of temporal-length limitations in XeCl lasers. R.Bruzese, D.C.Hogan (Clarendon Lab., Univ. of Oxford, Oxford, England). *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.1, p.54-61 (11 July 1983). Experimental observations of the development of constrictions in rare-gas halide laser discharges are reported. The onset of constriction is related to the premature termination of both spontaneous emission and laser pulses in a discharge-excited XeCl laser. A mechanism is proposed to account for the onset of constriction in this laser which may be more generally applicable to other discharge-excited devices. (5 refs.)

112985 A 1.5 W CW optically pumped 12.08 μm NH_3 laser. P.Wazen, J.-M.Lourtioz (Inst. d'Electronique Fondamentale, Univ. Paris XI, Orsay, France). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.137-40 (15 Aug. 1983). Order-of-magnitude increase in output power and efficiency has been obtained from the new CW 12.08 μm NH_3 Raman laser optically pumped by a low-pressure CO_2 laser. The 12.08 μm output power is analyzed as a function of the main operational parameters. (6 refs.)

112986 Temperature requirements and corrosion rates in combustion driven hydrogen fluoride supersonic diffusion lasers. P.C.Nordine (Yale Univ., New Haven, CT, USA).

AIAA J. (USA), vol.21, no.8, p.1089-92 (Aug. 1983).

A maximum F-atom yield from F_2 occurs in a combustion driven hydrogen fluoride supersonic diffusion laser (HFSDL) because the amount of fluorine reacted with hydrogen (or deuterium) continues to increase with temperature after most of the unreacted fluorine has been thermally dissociated. A small decrease from the maximum combustor F-atom yield allows a significant decrease in the required temperature and in the corrosion rates that uncooled laser nozzles would display. The temperatures that give F-atom yields equal to 95% of the maximum values were calculated for typical HFSDL combustor pressures and F-atom mole fractions and the corrosion rates of uncooled nozzles were evaluated at these temperatures. The corrosion rates of materials resistant to fluorine attack at the highest temperatures would allow HFSDL applications or test experiments up to several hours duration. (33 refs.)

112987 Simple model for base pressure effects in source flow chemical lasers. K.E.Patterson, J.H.Batteh, S.S.Howie (Sci. Applications Inc., Maritta, GA, USA).

AIAA J. (USA), vol.21, no.8, p.1093-9 (Aug. 1983).

A simple model is developed to investigate the effects of base on the performance of source flow chemical lasers. The laser flowfield is divided into two coupled, one-dimensional regions representing the pure source flow region and a region influenced by the base pressure. The differential equations describing the gasdynamics, mixing, reaction and lasing in the two regions are formulated. The model indicates that lasing performance decreases as the base pressure increases. However, performance can approach and even exceed that of a pure source flow laser if the base pressure is controlled. (11 refs.)

112989 Electronic wavelength tuning with semiconductor integrated etalon interference lasers. A.Antreasyan, S.Wang (Dept. of Electrical Engng. & Computer Sci., Univ. of California, Berkeley, CA, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.530-2 (15 Sept. 1983).

A novel method for broadband quasicontinuous wavelength tuning in GaAs-GaAlAs semiconductor lasers is reported. The wavelength tuning experiment is performed with an interferometric laser consisting of a resonator with curved and straight segments. By separately pumping different segments of the laser the output wavelength can be tuned over a wide range. The outstanding features of the device are (1) very stable single longitudinal mode and stable transverse mode operation, and (2) a wavelength tuning range of as much as 90 Å. (9 refs.)

112990 Longitudinal mode spectrum of GaAs injection lasers under high-frequency microwave modulation. K.Y.Lau (Ortel Corp., Alhambra, CA, USA), Ch.Harder, A.Yariv.

Appl. Phys. Lett. (USA), vol.43, no.7, p.619-21 (1 Oct. 1983).

Experimental observations of the lasing spectrum of a single mode semiconductor laser under continuous microwave modulation reveal that the lasing spectrum is apparently locked to a single longitudinal mode for optical modulation depths up to ~80%, beyond which the lasing spectrum becomes multimoded, whose envelope width increases very rapidly with further increase in modulation depth. These results are satisfactorily explained by a theoretical treatment which enables one to predict the dynamic lasing spectrum of a laser from its CW lasing spectra at various output powers. (15 refs.)

112991 Fundamental linewidth in solitary, ultranarrow output $\text{PbS}_{1-x}\text{Se}_x$ diode lasers. C.Freed, J.W.Bielinski (Lincoln Lab., MIT, Lexington, MA, USA), W.Lo.

Appl. Phys. Lett. (USA), vol.43, no.7, p.629-31 (1 Oct. 1983).

The fundamental, quantum phase noise limited Lorentzian linewidth was directly measured from the beat-note spectra generated by heterodyning $\text{PbS}_{1-x}\text{Se}_x$ diode lasers with a stable CO gas laser. The experimental results were matched by calculated theoretical line profiles. Linewidths as narrow as 22 kHz full width at half-maximum power were observed. (16 refs.)

112992 Low ohmic multilayer contacts in lead-tin-telluride diode lasers. Ka.Herrmann, B.Sumpf, D.Bohme, M.Hannemann (Sektion Phys., Humboldt-Univ., Berlin, Germany).

Cryst. Res. & Technol. (Germany), vol.18, no.8, p.1083-9 (1983).

The preparation and the influence of low ohmic multilayer thin film contacts of lead-salt homo- and heterolasers on the degradation of lasing parameters during recycling processes between low working temperatures and room temperatures storage are described and discussed in detail. (14 refs.)

112993 Linewidth of a single mode in a multimode injection laser. M.J.Adams (British Telecom Res. Labs., Ipswich, England).

Electron. Lett. (GB), vol.19, no.17, p.652-3 (18 Aug. 1983).

An expression is derived for the quantum noise-limited linewidth of each individual mode in a multimode laser. Numerical calculations show that the mode linewidth of a two-mode 1.55 μm laser is only about 10% larger than that in a single-mode device. (6 refs.)

112994 Quantum mechanical explanation of spontaneous emission K-factor [comment]. J.Arnaud (Univ. des Sci. et Techniques du Languedoc, Bataillon, France).

Electron. Lett. (GB), vol.19, no.17, p.688-9 (18 Aug. 1983).

For original article see *ibid.*, vol.18, p.920-22 (1982). Marcuse has described gain-guided semiconductor lasers as 'inherently lossy'. The author feels that it is misleading to call the gain-guided configuration with net gain 'inherently lossy'. His conclusion is that, whenever there is a net gain, gain-guided modes and index-guided modes do not differ in nature but only in degree. Both are inherently lossless. (2 refs.)

112995 Automatic frequency control in a semiconductor laser and an optical amplifier. S.Koabayashi, T.Kimura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

J. Lightwave Technol. (USA), vol.LT-1, no.2, p.394-402 (June 1983).

Automatic frequency control (AFC) in an injection locked or resonant type amplifier in a AlGaAs semiconductor laser was achieved through using the terminal voltage change induced by light injection. Signal-to-noise in the control signal of 10 dB was obtained when the input optical power was -47 dBm and the optical gain was 51 dB. The AFC was maintained for 3 h with an 0.3 per cent output power fluctuation for 2°C ambient temperature change and 65-MHz frequency stability. Step response showed that the system response time was 1.5 s. Sensitivity to input optical power deteriorates at -49 dBm, with a 53-dB locking gain, because of frequency deviation caused by temperature modulation. The second derivative of the induced voltage and its relation to the optical frequency is constant at 5×10^{-10} [V/(MHz)²] for all input power levels in a buried-heterostructure (BH)-AlGaAs laser. Terminal voltage change induced by light injection is calculated by simple rate equations with a Gaussian-Halperin-Lax (GHL) bandtail model. Good agreement with experimental results was seen. (26 refs.)

112996 Influence of the luminescence saturation effect on the lasing threshold of InGaAsP/InP double heterostructure lasers ($\lambda=1.3 \mu\text{m}$) at $T \geq 300\text{K}$. D.Z.Garbuzov, V.P.Chalyi, V.V.Trukan, Agaev, M.K. (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.338-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.538-40 (March 1983). [received: Sept. 1983]

Investigates for the first time the influence of the luminescence saturation effect on the nature of the temperature dependence of the threshold of InGaAsP/InP double heterostructures. The results obtained were compared with the data of corresponding investigations carried out in the case of electric current excitation of InGaAsP/InP double heterostructure lasers. (6 refs.)

112998 Rare-earth converters of neodymium laser radiation. A.A.Mak, B.M.Antipenko.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1458-71 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1029-45 (Dec. 1982). [received: Sept. 1983]

The paper is concerned with an analysis of the status of the authors' research on broadening the spectrum of lasing frequencies of solid-state rare-earth lasers using the method of optical pumping of their media by neodymium laser radiation. In this method, spectral transformation of the radiation of the pumping laser is achieved by processes occurring in optically excited crystals, such as radiative and nonradiative transitions, intercenter transfer of excitation energy, and interaction of excited states, in particular, leading to the summation of the electronic excitation energy. (46 refs.)

112999 The slab geometry laser. W.B.Jones (General Electric Corporate Res. & Dev. Center, Schenectady, NY, USA).

Laser Focus (USA), vol.19, no.9, p.106-14 (Sept. 1983). Solid-state laser material, especially Nd^{3+} -glass, has been used for many years in a slab geometry for high-peak-power laser amplifiers. During the past 10 years, however, a slab geometry has been developed that is useful for high-average-power Q-switched oscillator and amplifier applications. With the near-diffraction-limited beam quality that can be obtained from a solid-state slab laser, nonlinear mixing techniques can be used for efficient conversion of the Nd^{3+} laser wavelength to shorter wavelengths. Efficient down-conversion of a beam wavelength to longer wavelengths can be carried out, for example, by stimulated Raman scattering in high-pressure gases. Thus, the slab geometry development has significantly expanded the utility of the solid-state laser. Nd^{3+} , which lases efficiently at a single wavelength, is the active ion that has been used in most of the slab laser development. In addition, the recent development of Cr^{3+} -doped solid-state materials offers the potential for a high-average-power tunable laser. (8 refs.)

113000 Emerald—a new gem laser material. J.Buchert (Inst. of Ultrafast Spectroscopy & Lasers, City Coll. of New York, New York, NY, USA), R.R.Alfano.

Laser Focus (USA), vol.19, no.9, p.117-23 (Sept. 1983). Describes the physics, current status, and potential of emerald ($\text{Be}_3\text{Al}_2(\text{SiO}_3)_6\text{-Cr}^{3+}$) as a new laser source. Emerald, a wideband tunable laser, has ideal characteristics for fast Q-switching and ultrafast pulse generation by mode-locking. This material improves its performance at elevated temperatures instead of stopping laser action as in many others. (21 refs.)

113001 Chaotic and periodic emission of high power solid state lasers. R.Hauck, F.Hollinger, H.Weber (Dept. of Phys., Univ. of Kaiserslautern, Kaiserslautern, Germany).

Comm. Commun. (Netherlands), vol.47, no.2, p.141-5 (15 Aug. 1983). Nonlinear, dynamical systems even with a few degrees of freedom may show chaotic or periodic behaviour, depending on the parameters of the system. Recently it was demonstrated, both experimentally and theoretically, that the temporal emission of a laser can become chaotic, if several longitudinal modes oscillate [Brunner and Paul (1983), and Abraham et al. (1982)]. The chaotic emission is caused by the nonlinear interaction of the modes and the longitudinal gain structure [Komtomseva et al. (1982)]. In this paper it is pointed out that the transverse mode structure and the radial gain profile produced by the transversal modes, may give rise to temporal instabilities of the laser emission. If the relevant parameters of the laser oscillator—Fresnel number, resonator losses, pump rate—exceed certain critical values, the output intensity becomes unstable. The damped relaxation oscillation changes into undamped periodic oscillation or, with increasing values of the above parameters, into chaotic emission. The theory, using the nonlinear Kirchhoff-Fresnel integral equation and the rate equation approach, is confirmed by experimental results. (14 refs.)

113002 Cascade laser generation by Er^{3+} ions in YAlO_3 crystals by the scheme $^4\text{S}_{3/2} \rightarrow ^4\text{I}_{13/2} \rightarrow ^4\text{I}_{11/2} \rightarrow ^4\text{I}_{13/2}$. A.A.Kaminskii (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR).

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1039-41 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1106-9 (Dec. 1982). [received: Sept. 1983] New data are presented on the spectral composition of cascade stimulated emission of Er^{3+} ions in a YAlO_3 crystal (space group $\text{D}_{2h}^{16}\text{-Pbnm}$) at ~ 110 and 300K in the two sequential losing channels $^4\text{S}_{3/2} \rightarrow ^4\text{I}_{9/2}$ and $^4\text{I}_{11/2} \rightarrow ^4\text{I}_{13/2}$ with an intermediate $^4\text{I}_{9/2} \rightarrow ^4\text{I}_{11/2}$ ($\Delta E \approx 1990 \text{ cm}^{-1}$). From the data on the kinetics of cascade generation it was concluded that there occurs stimulated emission of extremely-high-frequency phonons between the states $^4\text{I}_{9/2}$ and $^4\text{I}_{11/2}$ in $\text{YAlO}_3\text{-Er}^{3+}$. 42.55T Free electron lasers

113003 Study of gain, bandwidth, and tunability of a millimeter-wave free-electron laser operating in the collective regime. S.H.Gold, W.M.Black, H.P.Freund, V.L.Granatstein, R.H.Jackson, P.C.Efthimion, A.K.Kincaid (Naval Res. Lab., Washington, DC, USA).

Phys. Fluids (USA), vol.26, no.9, p.2683-8 (Sept. 1983). Frequency-resolved measurements of the emission of a collective free-electron laser operating at millimeter wavelengths have shown emission spectra that agree well with theoretical predictions for the collective free-electron laser instability. Broad tunability, moderate emission linewidths, and high single-frequency gain have been observed. In addition, adjusting the axial field in the end region of the interaction has been found in some cases to cause a large increase in measured power and efficiency. (16 refs.)

113004 Sources of stimulated radiation using resonance electron accelerators. D.F.Alferov, Yu.A.Bashmakov, K.A.Belovintsev, E.G.Bessonov, A.V.Serov, P.A.Cherenkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.167-71 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.270-7 (Feb. 1983). [received: Sept. 1983]

The main properties of spontaneous incoherent and coherent emission from relativistic particles in undulators are briefly discussed. Basic aspects of the classical theory of stimulated electron emission in undulators are considered, and an assessment is made of the possible use of standard electron accelerators in designing undulator lasers with a broad electromagnetic emission spectrum. (44 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

113005 Generation of single-longitudinal-mode gigabit-rate optical pulses from semiconductor lasers through harmonic-frequency sinusoidal modulation. H.Kawaguchi, K.Otsuka (Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

Electron. Lett. (GB), vol.19, no.17, p.668-9 (18 Aug. 1983). Generation of optical pulses at gigabit rates from semiconductor lasers by means of harmonic-frequency sinusoidal injection current modulation has been demonstrated for the first time. It was confirmed that these optical pulses consisted of one longitudinal oscillating mode because of the presence of a 'self-optical injection-locking effect'. (6 refs.)

Collisionless cyclotron absorption of photons by electrons in a laser beamSee Entry 112969

42.60B Design of specific laser systems

113006 Some ring-dye-laser designs incorporating a low-concentration double dye cell for 20-nsec pump pulses. J.Nildebrandt.

Appl. Opt. (USA), vol.22, no.18, p.2930-2 (15 Sept. 1983). Using a special cell design for low dye concentrations that limits the thickness of the transversely pumped dye solution by an exit window for the pump beam (1) sharp longitudinal modes with steep spectral line shapes develop because of the low small signal gain, and (2) the beam profile follows a Gaussian over 3 decades because both pump windows act as a mode selective aperture. The rest of the pump beam excites a second dye solution, separated from the first by a 1-cm thick window, so that a variety of different ring designs can easily be tested. The tendency of the linear resonator to form a double peaked output cross section was not observed with the running wave. (9 refs.)

113007 Phase-locked semiconductor laser array with separate contacts. J.Katz (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), E.Kapon, C.Lindsey, S.Margalit, U.Shreter, A.Yariv.

Appl. Phys. Lett. (USA), vol.43, no.6, p.521-3 (15 Sept. 1983). A new monolithic phase-locked semiconductor laser array has been fabricated. Employing two-level metallization, each of the eight elements in the array has a separate contact, thus making it possible to compensate for device nonuniformities and control the near-field and far-field patterns. Threshold currents are approximately 60 mA for each 5- μm -wide laser in the array. Phase locking has been observed via the narrowing of the far-field pattern. Experimental results are compared to those obtained from the same arrays operated with all the lasers connected in parallel. (13 refs.)

113008 Wavelength tuning of GaInAsP/InP integrated laser with butt-jointed built-in distributed Bragg reflector. Y.Tohmori, Y.Suematsu, H.Tsushima, S.Arai (Dept. of Phys. Electronics, Tokyo Inst. of Technol., Tokyo, Japan).

Electron. Lett. (GB), vol.19, no.17, p.656-7 (18 Aug. 1983). Fine tuning of lasing wavelength was achieved with a butt-jointed built-in DBR laser integrated with an additional tuning waveguide. The plasma effect of the injected carrier was utilised. The wavelength shift of 4.0 Å was demonstrated by an injected tuning current of 4.1 mA. (5 refs.)

113009 Far-field distributions of semiconductor phase-locked arrays with multiple contacts. J.Katz (Jet Propulsion Lab., Pasadena, CA, USA), E.Kapon, C.Lindsey, S.Margalit, A.Yariv.

Electron. Lett. (GB), vol.19, no.17, p.660-2 (18 Aug. 1983). Experimental results of far-field patterns of semiconductor laser arrays with multiple contacts are reported. It is found that, by tailoring the distribution of the currents through the array elements, narrow single-lobe patterns—which are more useful in most applications—can be obtained from arrays that usually operate in a double-lobe mode. A diffraction-limited 1.8°-wide far-field pattern was obtained from a three-element array. (10 refs.)

113010 Emission frequency stability in single-mode-fibre optical feedback controlled semiconductor lasers. F.Favre, D.Le Guen (CNET, Lannion, France).

Electron. Lett. (GB), vol.19, no.17, p.663-5 (18 Aug. 1983). A newly designed semiconductor laser emitter with adjustable linewidth by controlling the coupling to a single-mode fibre is described with emphasis on thermal requirements to obtain a high-frequency stability. A stable operation has been achieved during more than 1 h using an AlGaAs laser diode with optical feedback from a 50 cm-long single-mode fibre resulting in a 50-fold reduction of the spectral linewidth. (5 refs.)

113011 1.3 μm InGaAsP/InP multiquantum-well lasers grown by vapour-phase epitaxy. T.Yanase, Y.Kato, I.Mito, M.Yamaguchi, K.Nishi, K.Kobayashi, R.Lang (Opto-Electronics Res. Labs., NEC Corp., Kawasaki, Japan).

Electron. Lett. (GB), vol.19, no.17, p.700-1 (18 Aug. 1983). Low-threshold InGaAsP/InP multiquantum-well lasers emitting at 1.3 μm have been successfully fabricated. The multilayer structure has been grown by hydride transport vapour-phase epitaxy with a double-growth chamber reactor. Broad-area structure threshold current density as low as 1.2 kA/cm^2 has been obtained. (10 refs.)

113012 Preventing beam shifting in a nitrogen-dye laser. R.C.Arnold (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.26, no.1, p.9-10 (June 1983). A shim was created to hold the dye cell rigid, which solved the beam shifting problem. (no refs.)

113013 Facet-coated graded-index separate-confinement-heterostructure single-quantum-well lasers having low degradation rates (<1 percent/kh) at 70°C. R.D.Dupuis, R.L.Hartman, F.R.Nash (Bell Labs., Murray Hill, NJ, USA).

IEEE Electron Device Lett. (USA), vol.EDL-4, no.8, p.286-8 (Aug. 1983). The results of accelerated life testing of $\text{Al}_x\text{Ga}_{1-x}\text{As-GaAs}$ single-quantum-well (QW) lasers having graded-index (GRIN) separate-confinement heterostructure (SCH) active regions are reported. These results are the first to show that lasers grown by MOCVD can have low degradation rates (<1 percent/kh) at 70°C and are also the first light-emitting lifetime data for GRIN-SCH quantum-well lasers. The laser structures were grown by metal-organic chemical vapor deposition (MOCVD) at atmospheric pressure using an uninterrupted growth sequence. Shallow proton-bombarded $5\text{-}\mu\text{m}\times 250\text{-}\mu\text{m}$ stripe-geometry lasers were fabricated from these wafers and lasers with and without Al_2O_3 facet coatings were life tested at 70°C and 5 mW per mirrors facet. Facet-coated lasers have lived longer than 1100 h with degradation rates as low as 0.5 percent/kh. (18 refs.)

113014 Intense proton beam excitation of the high pressure Ar/N₂ laser. L.G.Wiley, D.A.Hammer (Lab. of Plasma Studies, Cornell Univ., Ithaca, NY, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.4806-20 (Sept. 1983). In this paper, parametric studies are presented of a high pressure Ar/N₂ gas laser excited by an intense proton beam from a magnetically insulated diode. Using power deposition of up to a 140 MW/cm², gas pressure up to 3040 Torr, variable N₂ fraction (5%-90%), and several mirror reflectivities and gain lengths, laser power (up to 500 kW), efficiency ($\leq 0.4\%$), gain, threshold conditions, and spectral characteristics have been studied. Laser action was achieved at three wavelengths in the second positive band of N₂: 337.1, 357.1, and 380.5 nm. Comparison of the observations with predictions of a model showed that emission at all three wavelengths was expected, and initiation times and pulse durations of the three lines were accurately predicted. Observed similarities and differences between proton beam and electron beam excitation of the Ar/N₂ laser are discussed. (36 refs.)

113015 Fading properties of a NaF:F₂⁺⁺ color center laser. H.Eisele, H.J.Paus, J.Wagner (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), M.Leduc.

J. Appl. Phys. (USA), vol.54, no.9, p.4821-5 (Sept. 1983). An investigation of the temporal stability of a color center laser based on F₂⁺⁺ centers in NaF is presented. It is found that the fading of the output power strongly depends on pump power, intracavity power, pump wavelength, and temperature. Optimum conditions for operation were thus derived to improve the temporal stability of this tunable laser. (22 refs.)

113016 A novel distributed feedback colour centre laser. T.Kurobiri, N.Takeuchi (Faculty of Technol., Kanazawa Univ., Kanazawa, Japan).

Opt. Acta (GB), vol.30, no.10, p.1363-6 (Oct. 1983). A novel distributed feedback (DFB) colour centre laser is proposed. The feedback mechanism is provided by the periodic spatial modulation of the refractive index which is induced by applying an acoustic wave to the crystal coloured by X-ray irradiation. Numerical estimates for this method are also presented. (19 refs.)

113017 High-speed, low-cost laser-triggered plasma shutter. M.Hasselbeck, L.Huang, S.C.Hsu, H.S.Kwok (Dept. of Electrical & Computer Engng., State Univ. of New York, Buffalo, NY, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1131-4 (Sept. 1983). Design and construction of a CO₂ laser-triggered plasma shutter is described. An inexpensive pyroelectric detector and a novel needle-resistor spark gap, requiring an applied voltage of less than 500 V, are employed. The total electronic delay can be made to be less than 15 ns with subnanosecond jitter. This plasma shutter finds applications in producing picosecond CO₂ laser pulses and in optical isolation. (10 refs.)

113018 Discharge-pumped high pulse rate excimer laser. A.Vill, T.Klementi, V.Mikhel'son, V.Altukhov.

Toim. Eesti NSV Tead. Akad. Fuus. Mat. (USSR), vol.32, no.1, p.109-13 (1983). In Russian. The authors developed and investigated a compact excimer pulse-periodic XeF laser with comparatively high efficiency and with high pulse energy. They show how it is possible to choose optimal parameters for the pumping system and the laser radiation by way of a model calculation of the discharge current and voltage circuit oscillograms. (6 refs.) V.G.P.

113019 Recent progress on semiconductor lasers. S.Wang (Dept. of EECS, Univ. of California, Berkeley, CA, USA).

Wescon/82 Conference Record, Anaheim, CA, USA, 14-16 Sept. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.26-1/1. Semiconductor lasers for signal processing and optical fiber communication require a stable radiation pattern and single longitudinal mode operation. Two-dimensional guiding structures for lateral mode stability are reviewed. Current research on improving longitudinal mode behavior is discussed for laser operation over an extended temperature range and at a high data rate. (no refs.)

42.60D Laser resonators and cavities

113020 Line selection in carbon dioxide waveguide lasers using diffraction gratings. A.M.Holohan, S.L.Pruntz (Dept. of Electrical Engng., Univ. Coll., Cork, Ireland).

Infrared Phys. (GB), vol.23, no.3, p.149-56 (May 1983). Treats theoretically the coupling losses which arise in square dielectric waveguide CO₂ lasers when one element of the optical resonator is a diffraction grating. These losses are due to imperfect coupling of the radiation which is launched from the end of the guide to the grating and returned from the grating back to the guide. The results of the calculations show that the coupling efficiency is a sensitive function of radiation wavelength. This result is then used to investigate the ability of a 150 lines/mm diffraction grating to resolve adjacent rotational-vibrational transitions in the CO₂ emission. It is shown that 'line-hopping' places a limitation on the maximum tunability which can be obtained and is a result of the poor discrimination at the grating surface especially in the case of waveguide lasers having much reduced apertures. Computations based on the scaling laws are employed to maximise the tunability as a function of waveguide aperture taking into account limitations imposed by 'line-hopping', cut-off and the optical resonator frequency offset conditions of $c/4L$. Comparisons are made between

theory and experiment, and design guidelines for the construction of widely tunable CO₂ waveguide lasers are presented graphically. (19 refs.)

113021 Stability of a detuned single mode homogeneously broadened ring laser. P.Mandel, H.Zeghlache (Service de Chimie-Physique II, Univ. Libre de Bruxelles, Bruxelles, Belgium).

Opt. Commun. (Netherlands), vol.47, no.2, p.146-50 (15 Aug. 1983). Studies analytically the influence of detuning on the properties of a homogeneously broadened single mode ring laser. In the good cavity domain the stationary output is stable. In the bad cavity domain the stationary output becomes unstable via a Hopf bifurcation. Near linear center this Hopf bifurcation is subcritical, leading to unstable small amplitude oscillations. Far from line center this Hopf bifurcation is supercritical and leads to stable small amplitude output. (15 refs.)

113022 Dewar design for optically pumped semiconductor ring laser. A.Fuchs, M.M.Salour (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1143-4 (Sept. 1983). A simple liquid-nitrogen Dewar has been constructed to hold semiconductor platelets for use in a ring laser assembly. Laser action in an external ring cavity is observed when the platelets are longitudinally pumped by an Ar⁺ laser. Microscope objectives mounted outside the Dewar are used to focus the pump beam as well as the lasing beam into the crystal. Positioning of the platelets in horizontal and vertical directions is accomplished by attaching the Dewar to an xyz stage. (8 refs.)

113023 High-Q open resonant structures with a sparse spectrum. A.A.Kuraev, E.I.Nefedov, A.Ya.Slepian, G.Ya.Slepian (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.603 (Nov. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1402-3 (Nov. 1982). [received: Sept. 1983]

Calls attention here to the possibility of developing high-Q (in particular, coaxial) open resonant structures using surface magnetic modes with a nonunit radial index. Coaxial H_{m1q} open resonant structures can be constructed because the 'dispersion' characteristics of H_{m1} waves have a descending region as the ratio of radii of the coaxial structure, $\Delta = a/b$, decreases from 0 to 1 (a and b are the radii of the inner and outer parts of the coaxial structure): $\tilde{\kappa} = \tilde{\kappa}(\Delta)$, where $\tilde{\kappa}$ is the transverse eigenvalue for H_{m1} magnetic waves. Knowing the dependence $\tilde{\kappa} = \tilde{\kappa}(\Delta)$ for magnetic modes one can tailor the profile of the structure to produce the required configuration of an open resonant structure with 'nonfocusing' mirrors operating in H_{m1q}, $n \geq 2$ modes. The remarkable property of open resonant structures with nonfocusing mirrors—one mode per octave—is preserved, and the Q turns out to be considerably higher because of the larger working volume (in comparisons with an H_{m1q} open resonant structure). 42.60F Laser beam modulation

113024 Enhanced frequency modulation in cleaved-coupled-cavity semiconductor lasers with reduced spurious intensity modulation. W.T.Tsang, N.A.Olsson (Bell Labs., Murray Hill, NJ, USA).

Appl. Phys. Lett. (USA), vol.43, no.6, p.527-9 (15 Sept. 1983). The authors have observed enhanced analog frequency modulation in a cleaved-coupled-cavity (C³) laser. One diode is DC biased above threshold to produce the desired output power and the other diode, the modulator, is biased below threshold with a DC current and a small modulating current superimposed to achieve analog frequency modulation of the output beam. Comparing with direct analog frequency modulation of a conventional semiconductor laser, the C³ laser has allowed the authors to obtain significantly larger frequency deviation with negligible spurious intensity modulation. Further, the present frequency modulation response is also much more uniform with respect to modulation frequency. In addition, this scheme is applicable to C³ lasers formed from all laser structures. (18 refs.)

113025 Passive mode locking of a long pulse XeCl laser. S.Watanabe, M.Watanabe, A.Endoh (Inst. for Solid State Phys., Univ. of Tokyo, Tokyo, Japan).

Appl. Phys. Lett. (USA), vol.43, no.6, p.533-5 (15 Sept. 1983). Passive mode locking has been achieved in a XeCl laser with the gain duration over 150 ns. The saturation characteristics of absorber dyes including BBQ, BPBD, and PTP were measured, resulting in the lowest saturation intensity of BBQ. The almost 100% modulated train of 12 pulses was achieved with the rapid pulse sharpening to the duration of ~ 2 ns, when BBQ was used as a saturable absorber. (17 refs.)

113026 Bandwidth-limited picosecond pulse generation in a synchronously pumped GaAs laser containing a variable absorber diode. W.A.Stallard, D.J.Bradley (Phys. Dept., Trinity Coll., Dublin, Ireland).

Appl. Phys. Lett. (USA), vol.43, no.7, p.626-8 (1 Oct. 1983). The authors report combined active and passive mode locking of an external cavity semiconductor laser containing one absorbing and one gain diode. Compared with active mode locking alone this method requires less critical tuning of the RF modulation frequency and is not limited to operation close to threshold. Colliding pulse mode locking is achieved by placing the absorber diode at one end of the cavity so as to increase the effective absorber cross section. Streak camera measurements show that the pulse trains are free from background noise and that the 30-ps pulses are bandwidth limited with sech² profiles. (23 refs.)

42.60H Optical problems related to properties and interactions of laser beams

113027 Relation between frequency and intensity stabilities in AlGaAs semiconductor laser. H.Tsuchida, T.Tako (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1152-6 (July 1983). The frequency and intensity stabilities of an AlGaAs semiconductor laser are measured during free-running, frequency-stabilized and intensity-stabilized operations. Each stabilization mode is achieved by controlling the injection current. The experimental results are discussed and the causes for the frequency and intensity fluctuations considered. The feasibility of simultaneously stabilizing both the frequency and the intensity is also discussed. It is concluded that simultaneous stabilization cannot be achieved by controlling the injection current alone. (25 refs.)

113028 Estimation of the ultimate frequency stability of semiconductor lasers. M.Ohtsu (Internat. Cooperation Center for Sci. & Technol., Tokyo Inst. of Technol., Tokyo, Japan), H.Fukuda, T.Tako, H.Tsuchida. *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.7, p.1157-66 (July 1983). The frequency stabilities of 0.8 μm AlGaAs lasers were estimated by using the Allan variance as a measure of the stability. The contributions of the quantum noise (the spontaneous emission, carrier, and current noise) and additional noise (current source noise and temperature noise) are given. The highest frequency stability of the free-running laser was estimated to be 6.3×10^{-11} at an integration time of 0.1 s. It is shown that the frequency stability of the stabilized laser is limited by the quantum noise. The estimated results were compared with the experimental results and with the estimated stability of 3.39 μm He-²²Ne lasers. The derivations of the spectral width from the frequency stability are also given. The narrowest limit of the spectral width was estimated to be 5.5 MHz (HWHM) for $I/I_0 = 1.3$, while the corresponding experimental result was 6.2 MHz for a channeled-substrate planar (CSP)-type laser. (33 refs.)

113029 Laser-beam attenuation measurement using acousto-optic modulator. T.Kawakami, I.Yokoshima (Electrotech. Lab., Ibaraki, Japan). *Electron. Lett. (GB)*, vol.19, no.17, p.653-4 (18 Aug. 1983). A laser-beam attenuation-measurement method using the first-order diffraction from an acousto-optic modulator is developed. The attenuation is determined from the voltage of the 30 MHz driving signal of the modulator. A value of attenuation of more than 50 dB can be measured at 633 nm. (3 refs.)

113030 Direct observation of visibility curve of semiconductor lasers. W.Eickhoff, E.Brinkmeyer, H.Barfuss (Tech. Univ. Hamburg-Harburg, Hamburg, Germany). *Electron. Lett. (GB)*, vol.19, no.18, p.739-40 (1 Sept. 1983).

A method for the determination of the linewidth of semiconductor lasers is demonstrated. It employs tuning of the laser frequency, observation of the backscattered light from a single-mode fibre and Fourier-transform evaluation. (3 refs.)

113031 Thermoelastic stresses produced in an absorbing layer by the action of a laser pulse. A.A.Bakeev, A.P.Sobolev, V.I.Yakovlev. *J. Appl. Mech. & Tech. Phys. (USA)*, vol.23, no.6, p.821-6 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.92-8 (Nov.-Dec. 1982). [received: Sept. 1983]

By solving the thermoelasticity problem for a semispace, the dimensionless parameter range characteristic of the material and laser action are determined, in which exfoliation of the irradiated surface is possible. It is obvious that with other conditions being equal the thermoelastic stress is highest if cooling of the absorbing layer of material over the duration of energy liberation can be neglected. (12 refs.)

113032 Vernier fringe-counting device for laser wavelength measurements. A.Kahane, M.S.O'Sullivan, N.M.Sanford, B.P.Stoicheff (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1138-42 (Sept. 1983).

A vernier fringe-counting circuit designed for use with a Kowalski-type wavemeter is described. Wavelength measurements made with this device have a high reproducibility of 5×10^{-9} (or 1/50 of a fringe) and measured accuracy of 4×10^{-9} . The results of accuracy tests are presented along with systematic errors incurred when the wavelengths of two He-Ne lasers (632.9 nm) are compared by the vernier method. (14 refs.)

113033 Beam-splitter mount for efficient monitoring of mode-locked and synchronously pumped CW lasers. A.van Hoek (Dept. of Molecular Phys., Agricultural Univ., Wageningen, Netherlands), A.J.W.G.Visser. *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1145-7 (Sept. 1983).

Monitoring the optical pulses from mode-locked and synchronously pumped continuous wave (CW) lasers, reference beams are taken from the main beams with beam splitters. Depending on the angle with respect to the incident beam and the direction of the rotation axis of the beam splitter, light fractions of different polarizations can be selected. Based on practical and theoretical considerations an alternative beam-splitter mount has been designed which efficiently utilizes the available optical power. (14 refs.)

113034 Acoustic wave calibration for CO₂ laser scattering experiments. J.F.Valley, R.E.Slusher (Bell Labs., Murray Hill, NJ, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1157-62 (Sept. 1983).

An acoustic wave technique is described which provides an absolute calibration of the amplitude of the light scattered from a CO₂ laser light scattering. Using simple vibrating membranes, acoustic waves with wavelengths from a few millimeters to several centimeters can be generated with accurately measured amplitudes. Laser scattering from these waves verifies that wavelengths as long as 2 cm can be resolved with small-angle CO₂ laser scattering. For the case of heterodyne detection, calibration of the scattered wave amplitudes is obtained to within $\pm 20\%$. (11 refs.)

113035 The thermal self-excitation of the beam of a continuous CO₂ laser which interacts with water aerosol. S.A.Armand, V.P.Bisyrin, V.V.Yefremenko, M.A.Kolosov, L.N.Kornilov. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.11, p.86-90 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2162-6 (Nov. 1982). [received: Sept. 1983]

The results of measurement of divergence of the beam of a continuous CO₂ laser are given when such a beam propagates through an evaporating water aerosol. The measurements are taken by using transit bolometers for measure-

ment of distribution of intensity in the transverse cross-section of the beam. Experimental results are compared with computations of thermal self-defocusing by using the thin-lens approximation. (12 refs.)

42.65 NONLINEAR OPTICS

113036 Nonlinear magneto-optics in semiconductors. R.B.Dennis, H.A.MacKenzie (Dept. of Phys., Heriot-Watt Univ., Edinburgh, Scotland). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.237-44 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Extends to finite magnetic fields the study of the exceptionally large value of $\chi^{(3)}$ found for moderate radiation intensities close to resonance with interband transitions in Indium Antimonide (InSb). The intensity dependence of both interband magneto-absorption and dispersion for transitions between individual identifiable Landau levels, was examined experimentally. The intensity dependence of the magnetic field dependent oscillations, in non-resonant interband Faraday rotation, provided a sensitive technique for the study of changes in magneto-dispersion. An intensity induced rotation corresponding to a maximum nonlinear refractive index of $-9 \times 10^{-5} \text{ W}^{-1} \text{ cm}^2$ ($\chi^{(3)}$ can 10^{-1} esu , or $ca 10^{-9} \text{ m}^2 \text{ V}^{-2}$) was observed. This effect exhibited resonant enhancement as the pump photon energy approached that of both the fundamental bandgap and an acceptor transition and showed saturation at increased incident intensity. The effect was determined to be primarily the result of the blocking of the interband transition by photoexcited carriers. The results are compared with two new microscopic models, the direct saturation model, which assumes a non-thermal distribution of the photoexcited carriers, and the dynamic Burstein-Moss model, which assumes a thermalised distribution. Comparison with experimental results yields values for the electron-hole dephasing time of T_2 of the order of 3 ps and an interband relaxation time of T_1 of the order of 100 ns. (13 refs.)

113037 Resonant modes in a dispersive cavity. K.Gardner, J.M.Vaughan (Royal Signals & Radar Establ., Gt. Malvern, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.253-56 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982). During some initial investigations of bistability, in an optical cavity containing calcium vapour, a hitherto unrecorded modification of the resonant mode separation was found. This unusual phenomenon occurs symmetrically on either side of the absorption line and is shown to result from the dispersive character of the cavity. (3 refs.)

113038 Low intensity nonlinear refraction in cadmium mercury telluride at 10.6 μm . G.Parry, J.R.Hill, A.Miller (Royal Signals & Radar Establ., Gt. Malvern, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.266-8 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982). The authors report the observation of large intensity dependent refractive index changes in cadmium mercury telluride at 175K and at 10.6 μm wavelength. The effects are observed by measuring changes in the half power width of a Gaussian laser beam focused through a thin sample of the material. (8 refs.)

113039 Solitons in single mode optical fibres. A.D.Boardman, G.S.Brown, G.S.Cooper (Dept. of Phys., Univ. of Salford, Salford, England). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.422-8 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A first principles derivation is given of the evolution equation for nonlinear pulse propagation in an optical fibre. It avoids many of the difficulties encountered in some other theories and emphasises that waveguide effects can be included in a natural and logical manner. It is preceded by a brief review of the principal features of solitons in optical guides, and a critical discussion is given of previous theoretical descriptive roles of waveguide and material dispersion and some examples of the behaviour of solitary wave solutions of the nonlinear Schrödinger equation. (19 refs.)

113040 Hysteresis in the reflection of light at the boundary with a nonlinear medium in the presence of a transition layer. B.B.Boiko, N.S.Petrov. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1386-90 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.949-55 (Dec. 1982). [received: Sept. 1983]

Hysteresis properties in the reflection (transmission) of light in the optical system containing a transparent plane-parallel transition layer at the boundary with the nonlinear medium are investigated. In particular, the possibility of realizing conditions of total transmission in this optical system at the hysteresis jump close to the limiting angle, and also the possibility of reducing the threshold intensities at which hysteresis occurs is elucidated. (6 refs.)

113041 Nonlinear optical activity. M.P.Lisitsa.

J. Appl. Spectrosc. (USA), vol.37, no.6, p.1391-9 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.955-65 (Dec. 1982). [received: Sept. 1983]

The natural rotation of the plane of polarization in the case of solids may be caused by the presence of gyrotropy associated with spatial dispersion and pleochroism due to the dependence of the absorption spectra on the orientation of the light vector with respect to the crystallographic axes. Pleochroism is characteristic of crystals of low symmetry, but may also occur in the case of centrosymmetric cubic lattices with impurity centers of nonspherical symmetry. Nonlinear optical activity was observed at large light-beam intensities in gyrotropic crystals and also at very small intensities in cubic lattices with F_A centers. (22 refs.)

113042 Light reflection from the interface of media with thermal nonlinearity. S.P.Chernov, A.V.Shepelev (Dept. of Quantum Theory, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.47-53 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.41-7 (1983).

Consideration is given to nonlinear thermal reflection, which consists in change in the Fresnel reflection coefficient with heating of the interface by radiation. A theory of this effect is proposed, and results are given of its experimental investigation and application for resonator Q-factor modulation. The possibility of using the effect for the anodization of radiation is discussed. (8 refs.)

113043 Subharmonic and chaotic bifurcation structure in optical bistability. P.Mandel, R.Kapral (Service de Chimie-Phys. II, Univ. Libre de Bruxelles, Bruxelles, Belgium).

Opt. Commun. (Netherlands), vol.47, no.2, p.151-6 (15 Aug. 1983). Provides a global view of optical bistability in the domain described by the Ikeda finite difference equation through a study of the boundary structure for marginally stable period N solutions in the parameter space. (13 refs.)

113044 Coherent light scattering from ruby dressed with RF photons.

T.Endo, T.Muramoto (Dept. of Phys., Kyoto Univ., Kyoto, Japan). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.165-9 (15 Aug. 1983).

The authors observed a new kind of coherent light scattering from ruby subjected to an RF Stark field and explained it in terms of RF photon dressing. The theory is also applied to explain the sublevel coherence generation by an RF Stark field in coherent Raman beat spectroscopy. (6 refs.)

113045 Quantitative investigation of critical slowing down in all-optical bistability. S.Cribier, F.Giacobino, G.Grynberg (Lab. de Spectroscopie Hertzienne, ENS, Univ. Pierre et Marie Curie, Paris, France).

Opt. Commun. (Netherlands), vol.47, no.2, p.170-2 (15 Aug. 1983). Optical bistability has been observed in rubidium vapor enclosed in a Fabry-Perot cavity for $\lambda \sim 7779 \text{ \AA}$ (two-photon transition) and $\lambda \sim 7800 \text{ \AA}$ (one-photon transition). The switching time τ_S has been measured as a function of $(I - I_c)$ where I_c is the last value of the length of the cavity for which switching occurs. All the experimental situations, the authors have found a similar law $\tau_S \sim (I - I_c)^{-\alpha}$ with $\alpha \sim 0.5$. This result is in agreement with theoretical predictions. (12 refs.)

113046 Nonlinear optical indication in frequency stabilization systems.

L.A.Budkin, V.V.Mityugov, A.I.Pikhtev, A.N.Yashina. *Radiophys. & Quantum Electron. (USA)*, vol.26, no.1, p.23-9 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.29-35 (Jan. 1983). [received: Sept. 1983]

Double resonance in a cell with alkali-metal vapor placed inside a laser resonator is investigated. The equations for the density matrix of the atomic vapor subjected to the combined action of a radio-frequency field and a standing light wave are solved. The parameters of the nonlinear optical indication signal under double-resonance conditions are calculated taking into account various physical factors. (12 refs.)

113047 Effects of the Abraham ponderomotive force induced by RF and laser light pulses. N.E.Galich (M.I. Kalinin Polytech. Inst., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.136-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.219-23 (Feb. 1983). [received: Sept. 1983]

The interaction of short RF and laser light pulses with transparent dispersive and nondispersive media is considered. As the pulse duration decreases, there is an increase in the Abraham ponderomotive force acting along the light beam. On the leading edge of a pulse the Abraham force is parallel to the wave vector, whereas it is opposite to the wave vector on the trailing edge. Dilating stresses are therefore produced in the medium. The strictional pressure along the beam has the opposite effect, but the Abraham force is greater than the strictional pressure and does not reach equilibrium with it. The dilating stresses may be large enough to pull a liquid apart and form cavities. The leading or trailing pulse fronts separately induce compressing forces in the medium. It is possible by changing the time dependence of the radiation pulse to regulate constriction and dilation of the medium parallel to the beam. In the region of frequency dispersion of the dielectric permittivity, the Abraham force increased when the medium is polarized at resonance and decreases due to relaxation processes as compared with the Abraham force for a nondispersive medium. Various nonlinear effects induced by the Abraham force are discussed (cavitation, liquid breakdown, self-focusing of backscattered light, phase transitions) when laser light pulses interact with liquids, gases, and solids. (12 refs.)

113048 Optical extinction theorem in the nonlinear theory of optical multistability. R.K.Bullough, S.S.Hassan (Dept. of Math., Univ. Manchester Inst. of Sci. & Technol., Manchester, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.257-63 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The optical extinction theorem due to P.P. Ewald, C.W. Oseen and C.G. Darwin is used completely to describe the action of a dielectric slab as a Fabry-Perot interferometer. The analysis is very comparable to that given by Born and Wolf. It is then shown that by generalising the optical extinction theorem to the nonlinear regime essentially the same Fabry-Perot cavity action is regained but in this case the refractive index and hence the cavity tuning depends on the input intensity. This way a multistable output/input relation is derived. It is shown further how the extinction theorem will also handle the problem of 'standing waves' in the cavity. The possibility of optical turbulence in a Fabry-Perot cavity is briefly mentioned. (24 refs.)

113049 Self-pulsing and transients of a Fabry-Perot interferometer with quadratic nonlinear medium. B.Wedding, A.Gasch, D.Jager (Inst. fur Angewandte Phys., Univ. Munster, Munster, Germany).

J. Appl. Phys. (USA), vol.54, no.9, p.4826-31 (Sept. 1983).

The dynamic properties of a Fabry-Perot interferometer filled with a material exhibiting second-order dispersive nonlinearity are studied both theoretically and experimentally. The response of the medium is described by an intensity dependent phase constant as derived from self-action effects. Considering two relaxation times, that of the material and that of the cavity, the basic relations for the stability analysis and for the numerical calculations are obtained. Bistability and self-pulsing effects are predicted. Moreover, the transient behavior is characterized by anomalous switching properties like overshoot and alternate switching. The corresponding experiments performed on a nonlinear transmission line resonator confirm the theoretical results. In a final discussion, the relations to the field of nonlinear optics are outlined. (23 refs.)

113050 Theory of the interaction of waves traveling in opposite directions in a nonlinear cubic medium. S.N.Vlasov, E.V.Sheinina (Inst. of Appl. Phys., Acad. of Sci., USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.15-22 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.20-8 (Jan. 1983). [received: Sept. 1983]

A theoretical study is made of the interaction of waves traveling in opposite directions in a finite nonlinear cubic medium. It is shown that the system is unstable. The authors determine the self-excitation thresholds of various modes of the system, and show that the frequency spectrum of the generated modes broadens rapidly (exponentially) with increasing pumping. The discussion is carried out by using parabolic equations. (13 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

113051 Wideband frequency conversion in the UV by nine orders of stimulated Raman scattering in a XeCl laser pumped multimode silica fiber. R.Pini, R.Salimbeni (Istituto di Elettronica Quantistica, CNR, Firenze, Italy), M.Matera, C.Lin.

Appl. Phys. Lett. (USA), vol.43, no.6, p.517-18 (15 Sept. 1983). Efficient wideband frequency conversion of the UV XeCl excimer laser wavelength has been accomplished by stimulated Raman scattering in a multimode UV silica fiber. Nine Stokes orders have been generated in the 308-350-nm spectral region at 650-kW input power. (9 refs.)

113052 Transient stimulated Raman scattering of femtosecond laser pulses. P.G.May, W.Sibbett (Optics Section, Blackett Lab., Imperial Coll., London, England).

Appl. Phys. Lett. (USA), vol.43, no.7, p.624-6 (1 Oct. 1983). Transient stimulated Raman scattering of amplified pulses from a passively mode-locked ring CW dye laser has been demonstrated to be a useful method for the production of coherent near infrared femtosecond light pulses. Hyper-short Stokes radiation is generated in capillary waveguides containing high pressure hydrogen (830 nm, 1265 nm) and methane (752 nm, 964 nm, 1340 nm) and pulse shortening factors as large as 2.9 have been observed. (13 refs.)

113053 Sum-frequency wave generation in optical fibers. Y.Sasaki, Y.Ohmori (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki-Ken, Japan).

J. Opt. Commun. (Germany), vol.4, no.3, p.83-90 (Sept. 1983). The generation of two-wave sum-frequency waves in optical fibers is presented. A mode-locked and/or Q-switched Nd:YAG laser operating at 1.064 μm wavelength is used as a pump laser. The sum-frequency waves are regenerated from the pump and the Raman Stokes lines. Phase matching is achieved by using the dispersion of the waveguide modes or the cladding modes in the optical fibers. When utilizing waveguide modes, 10^{-3} conversion efficiency from the pump into the sum-frequency wave, whose peak wavelength is 0.54 μm , is obtained with a 0.8 kW peak pump power. The observed coherence length for the sum-frequency wave generation is found to be about 200 meters. The experimental results indicate that the origin for the sum-frequency wave generation in the optical fibers is quadrupole nonlinearity. (29 refs.)

113054 Hybrid four-wave mixing in liquid pyridine. Guo Chu, Gao Zheng, Hua Luan, Chang Ai-Zhen, J.R.Lombardi (Inst. of Chem., Acad. Sinica, Beijing, China).

Chem. Phys. Lett. (Netherlands), vol.100, no.2, p.159-62 (2 Sept. 1983). Four-wave mixing spectra for liquid pyridine are obtained with broadband laser beam. A comparison of Stokes and anti-Stokes spectra allows the assignment of several lines (951, 991, 1030 cm^{-1}) to CARS and CSRS processes. Two additional moderately intense lines on the Stokes side between 951 and 991 cm^{-1} as well as 991 and 1030 cm^{-1} , which do not appear on the anti-Stokes side, are assigned to a 'hybrid four-wave mixing' process, in which two active Raman modes of pyridine are involved. This process previously unrevealed in experiment seems to be important for correct assignment of the spectral lines in four-wave mixing experiments with a broadband laser beam. (12 refs.)

113055 Optical second harmonic generation in LiNbO_3 crystals induced by a photovoltaic grating. S.K.Esayan, V.V.Lemanov, A.M.Arutunyan (A.F. Ioffe Physico. Tech. Inst., Leningrad, USSR). *Ferroelectr. Lett. Sect. (GB)*, vol.1, no.1, p.13-18 (1983).
Optical second harmonic induced by a photovoltaic grating written in LiNbO_3 :Fe was observed. Harmonic generation was due to the third-order nonlinear coefficient f_{333} linearized in the electric field of the grating. The phase matching condition was achieved by a suitable choice of the grating period. (5 refs.)

113056 Secondary-emission spectra of rhodamine 6G solutions with various levels of population inversion. B.S.Neporent, A.G.Spiro, V.B.Shilov. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1471-7 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1045-53 (Dec. 1982). [received: Sept. 1983]
The authors present an experimental study of the secondary-emission spectra of rhodamine 6G solutions occurring in ranges with different population inversions in order to check the conclusions of Neporent et al. (1981) on shapes of stimulated secondary emission spectra of dye solutions and Spiro et al. (1981) on interpretation of the superluminescence and stimulated Raman scattering of solutions of complex organic compounds. (23 refs.)

113057 Generation of continuous-wave 243-nm radiation by sum-frequency mixing. H.Hemmati, J.C.Bergquist (NBS, Time & Frequency Div., Boulder, CO, USA). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.157-60 (15 Aug. 1983).
Tunable CW radiation near 243 nm with a linewidth of less than 4 MHz has been generated by sum-frequency mixing the 351-nm radiation from an argon-ion laser with the 789 nm radiation from a ring dye laser in a crystal of ammonium dihydrogen phosphate held at moderate temperature. An external ring cavity, resonant with the dye laser, gives a power enhancement of about 12 in the sum-frequency generated radiation. Thermal lensing due to laser heating of the nonlinear crystal, distorted the 351 nm mode structure. This effect could limit the efficiency of the sum frequency mixing process. (11 refs.)

113058 Stimulated Brillouin scattering in optical fibers, and wavefront reversal. M.P.Petrov, E.A.Kuzin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.188-90 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.334-8 (Feb. 1983). [received: Sept. 1983]
Stimulated Brillouin scattering was investigated in a multimode optical fiber with core diameter 30 μ . The threshold pump power for a pulse length 30 nsec was found to be 4 kW and 1 kW for $\lambda=1.06$ and 0.53 μ respectively, in good agreement with the theory of STBS in a transient regime. It is shown that wavefront reversal accompanies STBS in a multimode optical fiber. The efficiency of pump radiation conversion into the reversed wave reached 50% or more. (8 refs.)

113059 Generation of coherent far-infrared radiation using lasers. A.A.Vedenov, G.D.Myl'nikov, D.N.Sobolenko (I.V. Kurchatov Inst. of Atomic Energy, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Usp. (USA)*, vol.25, no.11, p.833-53 (Nov. 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.138, no.3, p.477-515 (Nov. 1982). [received: Sept. 1983]
A review is given of methods used for generating coherent far-infrared radiation. They include the isolation of the frequency difference between two lasers, SRS by polaritons, optical pumping of gases, and the development of the electrical-discharge laser. Basic principles underlying the realization of the phenomena on which the above methods of generating far-infrared radiation are based are discussed. The properties of the working media, i.e. nonlinear properties of crystal converters (exploited in isolating the difference frequency and in SRS by polaritons), are described. Methods of producing inversion of level populations in gases used in lasers (pumped optically or by an electrical discharge) are analyzed. Specific schemes and device designs for the far infrared are described, and the possibilities and likely performance of these schemes are discussed. The review does not cover electron-beam generators (backward-wave tube, gyrotrons, etc.). (234 refs.)

113060 Phase matching during harmonic generation in high-pressure gas mixtures. S.A.Batishche, V.S.Burakov, V.I.Gladushchak, V.A.Mostovnikov, S.A.Moshkalev, G.T.Razdobarin, V.V.Semenov, N.V.Tarasenko, E.Ya.Shreider (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.591-2 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1375-7 (Nov. 1982). [received: Sept. 1983]
Odd harmonics are generated in gas mixtures under phase-matching conditions. Increasing the generation efficiency requires increasing the pressure of the gas, whose nonlinear susceptibility determines the properties of the nonlinear medium. This phase-matching method has been used for third-harmonic generation at the wavelength of the hydrogen L_α line in mixtures of krypton with argon at the high pressures. (6 refs.)

113061 Effects of interference on output in a proustite upconverter. K.Koyanagi, H.Hirayama, T.Mishima, I.Sakuraba (Faculty of Engng., Hokkaido Univ., Sapporo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.6, p.401-2 (June 1983).
Periodic variations of sum-frequency output are observed in upconversion of 10.6 μ m radiation from a CO_2 laser in a proustite crystal pumped by a Nd:YAG laser beam and concluded to be caused by multiple reflection of infrared waves which occurs inside the nonlinear crystal. (5 refs.)

113062 Degenerate forward four-wave mixing in LiNbO_3 . V.Kondilenko, S.Odoulou, M.Soskin (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Ferroelectr. Lett. Sect. (GB)*, vol.1, no.1, p.19-26 (1983).
Forward four-wave mixing in LiNbO_3 :Fe is used for generation of a phase-conjugate replica of unfocused beams of a CW He-Cd laser. The possibility

of partial self-compensation for static and light-induced optical inhomogeneities of a nonlinear sample is demonstrated. (15 refs.)

113063 Deflection of a phase-conjugate wave in nondegenerate four-wave mixing. A.I.Erokhin (Lebedev Inst. of Phys., Acad. of Sci., Moscow, USSR), V.R.Mironenko, V.I.Yudson. *Opt. Commun. (Netherlands)*, vol.47, no.2, p.161-4 (15 Aug. 1983).
The boundary problem for signal phase conjugation at nondegenerated four-wave mixing (FWM) is considered. In contrast to the statements of some authors it is shown that noncollinearity of the incident and the phase-conjugate waves occur. Expressions have been obtained for the deflection angle for a number of configurations of practical importance. Useful analogy between linear and nonlinear reflection at the FWM is noted. (9 refs.)

113064 Strong four-wave mixing with phase conjugation in a nematic liquid crystal. S.M.Arakelyan, S.D.Darbin, I.R.Shen (State Univ., Erevan, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.581-3 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1353-7 (Nov. 1982). [received: Sept. 1983]
The parametric four-wave interaction with oppositely propagating waves (in the frequency-degenerate case) appears to be one of the most interesting laser effects associated with wave propagation in nematic liquid crystals having a large optical orientational nonlinearity. The authors report an experiment for a purely optical nonlinearity of a standard nematic-liquid-crystal cell. The authors have taken some measurements, which they interpret at a qualitative level. 113065 Coherent pulse propagation in the infrared on the picosecond time scale. H.-J.Hartmann, A.Lauberau (Phys. Inst., Univ. Bayreuth, Bayreuth, Germany). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.117-22 (15 Aug. 1983).
Coherent propagation of resonant ultrashort pulses in gases is investigated theoretically and experimentally at medium pressure values. Drastic changes of the pulse wings extending over several ten picoseconds are predicted and experimentally observed using tunable pulses of 4 ps produced by a parametric generator device and picosecond IR light gates. The dephasing time T_2 of the R(3) vibration-rotation transition of HCl is measured to be $T_2 \times p = 21.5$ ps \times bar in the pressure range $p=1$ to 3 bar. Quantitative agreement between theory and experiment demonstrates that a novel transient spectroscopy in the infrared can be accomplished by coherent pulse reshaping. (27 refs.)

113066 Distortions of a CW light beam propagating through gas: self-lensing and spatial ringings. M.Le Berre (Lab. des Signaux et Systemes, Gif-sur-Yvette, France), F.Mattar, E.Ressayre, A.Tallet. *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.269-75 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Transverse effects on the profile of an intense off-resonant CW light beam, propagating through a gaseous cell of length l , are numerically displayed in both cases of the very small absorption length ($\alpha^{-1} \ll l$) and the intermediate case ($\alpha^{-1} \sim l$). As predicted by the theory, self-focusing and spatial ringings are obtained. Moreover for $\alpha l \sim 1$, these distortions generally appear as a recurrent process. (5 refs.)

113067 Reflection of wave beams from a screen in a nonlinear medium. A.P.Sukhorukov, V.A.Trofimov (Moscow State Univ., Moscow, USSR). *RadioPhys. & Quantum Electron. (USA)*, vol.26, no.1, p.8-14 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.12-19 (Jan. 1983). [received: Sept. 1983]
A theoretical study is made of the interaction of optical beams, one of which is reflected from a screen positioned in a nonlinear medium. The authors numerically model the Kerr and thermal self-interaction of Gaussian and annular beams and also optimize the entrance aperture of the beam to achieve the maximum energy concentration on the reflecting mirror. 113068 Thermal emissivities of films on substrates. A.Thakur, R.Raman (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India). *Appl. Energy (GB)*, vol.15, no.1, p.1-13 (1983).
An explicit expression for thermal emissivity of thin films has been derived in terms of optical constants of the substrate and film. At millimicron film thicknesses, the substrate plays a vital role in governing the emissivities of the films. For low values of the coefficient of absorption, the emissivity has a value of $\epsilon_1(\lambda)$ for zero film thickness, reaches a minimum at an optimum value of thickness and then increases monotonically to $\epsilon_2(\lambda)$ for very large values of thickness. $\epsilon_1(\lambda)$ and $\epsilon_2(\lambda)$ are, respectively, the emissivities of the bulk substrate and the film material. For large values of the coefficient of absorption, the emissivity passes through a minimum and then a maximum before monotonically decreasing to $\epsilon_2(\lambda)$ (for large values of the thickness), as the thickness is increased. Claude Bernard Lyon I, Villeurbanne, France), M.C.Schouler, C.Bernard. Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.459-64.

Water impurity in CVD SiO₂ dissociates after dissolution in glasses to form OH groups. A thermodynamic study is undertaken to investigate the influence of experimental parameters on the partial pressure of water vapour in contact with the deposition surface. The diffusion of atmospheric water vapour through the lateral surface of the preform during formation is also studied. It is shown that, when the initial pressure of SiCl₄ is constant, an increase in the O₂ partial pressure is a favourable factor to the presence of water vapour in the flame and thus to OH groups in the glass. Appl. Phys. Lett. (USA), vol.43, no.6, p.524-6 (15 Sept. 1983).

Laser recording on novel optical recording media with thermal coloration is reported. The basic recording mechanism is thermally induced chemical reaction between a coloring reagent and a coupling reagent that are deposited in vacuum, separated by a light absorbing layer. Transmittance changes on a 1- μ m size recording pit have been observed by writing with a laser diode at 830 nm. This medium is colored blue, red, or black by selecting a coloring reagent layer. It is applied to multicolor recording by accumulating units of media. (5 refs.)

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.10-14 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

ACCOS V is an optical design and analysis program copyrighted by SC, Inc., of Fishers, NY. MCI is a wavefront and interferogram analysis program developed by UNM personnel. These programs have been linked on the Cray and CDC computers at Kirtland AFB. The authors present information on the use and capabilities of this arrangement, showing examples of ACCOS input and optical path difference (OPD) calculations, and what features MCI adds to ACCOS analysis. Included are Zernike wavefront coefficients, contour plots, OPD maps, and some new developments in the capabilities of MCI. (4 refs.)

113073 Full aperture testing with subaperture test optics. J.G.Thunen, O.Y.Kwon (Electro-Optics Lab., Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.351, p.19-27 (1983). [received: Sept. 1983] (SPIE Proceedings on Wavefront Sensing, San Diego, CA, USA, 24-25 Aug. 1982).

Presents an overview of recent work of the Lockheed Palo Alto Research Laboratory on the use of subaperture test optics to evaluate the performance of large optical systems. Supported by selected subscale experiments, a theory has been developed that addresses two test conditions, each based on the use of a known test flat in a double-pass configuration with a collimated optical system of unknown quality. The two test conditions, in order of increasing theoretical complexity, are: (1) a single test flat covering only a portion of the full system aperture, and (2) multiple (not necessarily coherent) test flats. Analyses predict limited utility of a single test subaperture as a function of a subaperture size and location, and aberration content. Multiple subapertures viewing the full system are shown to give good results for higher order aberrations even when the individual test flats are unphased and contain large relative tilt errors. The test techniques described are fully scalable to future optical systems of arbitrary size. The authors summarise the theoretical basis for subaperture testing, give quantitative performance predictions for some selected cases, and present the results of supporting experimental work. 113074 Strehl's ratio for a two-wavelength continuously deformable optical adaptive transmitter. J.F.Holmes, V.S.R.Gudimetta (Dept. of Appl. Phys. & Electrical Engng., Oregon Graduate Center, Beaverton, OR, USA).

J. Opt. Soc. Am. (USA), vol.73, no.9, p.1119-22 (Sept. 1983).

Polychromatic adaptive optical systems differ from monochromatic systems in that the required phase compensation is measured at a wavelength (or wavelengths) different from that at which compensation is required. Unfortunately, the effect of turbulence is dispersive, and consequently, because of the wavelength difference, the compensation will not be exact. In effort to determine the magnitude of the effect, a formulation of Strehl's ratio for the polychromatic case has been developed and numerical data generated for both horizontal and vertical paths. (7 refs.)

113075 Methods for the investigation of laser mirrors for laser gyros. B.Grosser (Inst. fur Optik und Halbleiterphys., Tech. Univ. Braunschweig, Braunschweig, Germany).

Optik (Germany), vol.65, no.2, p.143-51 (1983). In German.

Laser mirror specimens were investigated using several methods: integral and differential backscattering and dark field microscopy. All the methods yielded comparable results, therefore each method is qualified for examination. The kind of pretreatment used was found to be crucial for the quality of the coating and the authors also estimated values of mean roughness for the samples. (10 refs.)

113076 Application of the theory of image formation to calculations on optical resonators. V.K.Ablekov, Yu.N.Babaev, M.F.Dmitriev, S.A.Kolyadin, A.V.Frolov.

Sov. Phys.-Dokl. (USA), vol.27, no.12, p.1058-60 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1114-17 (Dec. 1982). [received: Sept. 1983]

By treating the mode structure of an optical resonator as an optical image, one can describe the resonator in terms of the theory of image formation. The simplest description of an optical resonator can be given if the reflection coefficient of the resonator mirrors is a periodic function. In this case one can make use of the effect that images of grids are reproduced when the grids are illuminated by coherent light. The authors consider the condition for the formation of a field inside a resonator having infinite mirrors in the form of periodic structures. (4 refs.)

42.80C Spectral and other filters

- 113079 Properties of multilayer interference absorber with oblique incidence of radiation.** A.N.Baskakov, A.V.Tikhonravov (Dept. of Math., Moscow Univ., Moscow, USSR). *Moscow Univ. Phys. Bull. (USA)*, vol.38, no.1, p.7-10 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.8-11 (1983). The angular properties of a multilayer interference absorber (MIA) are theoretically investigated. With inclination of the MIA, its resonant curve is shifted into the short-wave region, and the magnitude of the shift is proportion to the square of the angle of incidence of the radiation. A simple expression is obtained, describing the form of the central lobe of the MIA directionality diagram. The laws for the suppression of external noise in receivers with MIA at the inlet are discussed, together with the possibilities of tuning these receivers with respect to the resonant frequency following from the MIA angular properties. 42.80F Gratings, echelles

- 113080 Blaze angle of the Bausch & Lomb R4 echelle grating.** S.Engman, P.Lindblom (Phys. Dept., Abo Akademi, Turku, Finland). *Appl. Opt. (USA)*, vol.22, no.17, p.2512-13 (1983). In a recent paper by R.A. Brown et al. (see *ibid.*, vol.21, p.167, 1982) the blaze angle of the extremely high-blazed R4 echelle grating manufactured by Bausch & Lomb was measured. The measurements gave a blaze angle $\theta = 72.5^\circ$, i.e. 3.5° less than that specified by Bausch & Lomb. Based on a recently published new model for the blaze of echelle gratings (see *ibid.*, vol.21, p.4356, 1982) the present authors present a new determination of the blaze angle that deviates from that obtained by Brown et al. It is concluded that the blaze angle of the R4 grating as specified by Bausch & Lomb can be too high by at most 1° . There is at present no model that described the blaze characteristics of high-blazed echelle gratings in the Littrow or near Littrow mounting. However, the maximum intensity of the blaze in this mounting is shifted from the blaze angle toward smaller α values. This shift seems to be proportional to λ^2 . (2 refs.)
- 113081 Reflex diffraction grating—an effective transducer of infrared radiation polarization.** A.N.Bobrovskii, G.D.Myl'nikov. *Instrum. & Exp. Tech. (USA)*, vol.25, no.6, pt.2, p.1466-7 (Nov.-Dec. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.6, p.136-7 (Nov.-Dec. 1982). A reflex diffraction grating is used as an IR radiation polarization transducer. A method of setting up the grating is described that permits obtaining elliptically and circularly polarized radiation from linearly polarized radiation. The radiation energy losses during conversion are $\leq 7\%$. (4 refs.)
- 113082 Stigmatic systems with concave spherical holographic diffraction gratings.** V.K.Prokof'ev. *J. Appl. Spectrosc. (USA)*, vol.37, no.6, p.1478-82 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.1053-9 (Dec. 1982). [received: Sept. 1983] In recent years there has been a considerable increase in the interest in concave holographic gratings, mainly on account of their specific focusing properties. With a concave diffraction grating, an important part is played in a modern spectral instrument by the astigmatism and consequent increase in the height of the spectral lines. In photographic recording, this reduces the intensity of illumination, while in photoelectric recording there is a considerable loss of energy because of the small size of the entrance window in the photomultiplier (for example, the window of a photomultiplier for the vacuum ultraviolet region has a size of only 10 mm). The author examines the disposition of the meridional and sagittal focal curves for a concave holographic diffraction grating made on a spherical substrate. The main attention is given to schemes that reduce the astigmatism considerably and that enable one to use existing vacuum-ultraviolet photomultipliers without energy loss. (2 refs.)
- 113083 Anisotropic gratings recorded from two circularly polarized coherent waves.** M.Attia, J.M.C.Jonathan (Inst. d'Optique, Univ. Pierre et Marie Curie, Paris, France). *Opt. Commun. (Netherlands)*, vol.47, no.2, p.85-90 (15 Aug. 1983). A constant intensity, rectilinear light vibration, with spatially varying orientation, is obtained from superposition of two orthogonal circularly polarized waves propagating in slightly different directions. Such an exposure on a photoanisotropic medium prints a grating characterized only by spatial variations in the orientation of the induced optic axis. The diffraction properties of such a grating are investigated. It behaves as a uniformly transparent isotropic medium when illuminated by the same waves as during the recording process. Illumination by a circular wave generates a transmitted and a single diffracted beam, while an incident elliptically polarized one would produce, apart from the central order, two diffracted beams with orthogonal circular polarizations. (10 refs.)
- 113084 Asymmetric extinction in anisotropic diffraction gratings.** L.K.Vistin', A.Yu.Kabaenkov, S.S.Yakovenko (A.V. Shubnikov Inst. of Crystallography, Acad. of Sci., Moscow, USSR). *Sov. Phys.-Dokl. (USA)*, vol.27, no.12, p.1044-6 (Dec. 1982). Translation of: *Dokl. Akad. Nauk SSSR*, vol.267, no.4-6, p.1353-7 (Dec. 1982). [received: Sept. 1983] The subject of the present paper is an experimental study of the diffraction of a beam at oblique incidence on modulated liquid crystal structures forming various types of diffraction gratings. Some new experimental results have been obtained, and analytical expressions have been found for some of the data.

- Asymmetric extinction of the odd diffraction orders was detected for certain angles of incidence of the light beam on the liquid crystal layer. (11 refs.)

42.80K Optical beam modulators

- 113085 A bistable hybrid optical device using an integrated modulator with an induced dielectric channel.** E.T.Aksenov, A.V.Kukharev, A.A.Lipovskii, A.V.Pavlenko (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.185-7 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.301-5 (Feb. 1983). [received: Sept. 1983] Experimental results are reported for a hybrid bistable optical device based on an integrated-optics modulator with an induced dielectric channel. Hysteresis is produced in the dependence of the light intensity at the modulator output on the input intensity by adding an external circuit providing positive intensity feedback (with respect to the intensity of the reflected light beam). Test results of the bistable optical device are reported for operation in the optical memory and 'optical transistor' modes. A light pulse amplification of 6 dB was achieved. (19 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

- 113086 Low-loss integrated optical waveguides fabricated by nitrogen ion implantation.** I.K.Naik (Northrop Res. & Technol. Center, Palos Verdes Peninsula, CA, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.519-20 (15 Sept. 1983). A technique for fabricating low-loss (on the order of 0.1 dB/cm) integrated optical waveguides in amorphous SiO₂-based material by nitrogen ion implantation is reported. By comparing the results of nitrogen implantation and oxygen implantation in SiO₂, the mechanism of waveguide formation in the nitrogen-implanted waveguides is shown to be chemical doping effect of the nitrogen dissolved in amorphous SiO₂. (8 refs.)
- 113087 Prism excitation of highly multimode deep planar waveguides.** J.Ctyroky, J.Janta (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Prague, Czechoslovakia), J.Schrofel. *J. Opt. Commun. (Germany)*, vol.4, no.3, p.104-9 (Sept. 1983). The period-of-propagation length concept for guided modes in planar waveguides is used to derive a simple expression for the coupling length of prism coupler. It is shown that the prism coupling strength for deep multimode waveguides strongly depends on the shape of the refractive index profile as well as—except for the linear profile—on the mode order. Further it is shown that for multimode waveguides simultaneous excitation of several guided modes is typical. Arising interference effects at the waveguide surface are explained and illustrated by experimental results obtained with ion-exchanged waveguides in glass. (13 refs.)
- 113088 Coupling of dielectric waveguides.** M.L.Calvo, R.F.Alvarez-Estrada (Dept. de Optica, Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.369, p.401-6 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982). A general integral equation for the total scattered magnetic field is presented. Thus, the coupling phenomena between N identical dielectric waveguides can be interpreted as a multiple scattering process. Application to the case of two identical dielectric waveguides allows a numerical behaviour to be obtained where the control of the degree of coupling is also known. (9 refs.)
- 113089 Optical losses in metal/SiO₂-clad Ti:LiNbO₃ waveguides.** L.L.Buhl (Bell Labs., Holmdel, NJ, USA). *Electron. Lett. (GB)*, vol.19, no.17, p.659-60 (18 Aug. 1983). Presents measured excess loss resulting from electrode overlays for both TE and TM polarisations as a function of SiO₂ buffer layer thickness for Ti:LiNbO₃ strip waveguides at $\lambda = 1.32 \mu\text{m}$. There is negligible excess loss to the TE mode with no buffer layer and the excess loss to the TM mode can be essentially eliminated with a SiO₂ layer only 700 Å thick. A passive polariser with ~ 1.5 dB fibre-waveguide-fibre insertion loss and >13 dB extinction ratio is also demonstrated. (6 refs.)
- 113090 Wavelength-discriminating photodetector for lightwave systems.** J.C.Campbell, C.A.Burrus, J.A.Copeland, A.G.Dentai (Bell Labs., Holmdel, NJ, USA). *Electron. Lett. (GB)*, vol.19, no.17, p.672-4 (18 Aug. 1983). Demonstrates that a dual-wavelength photodetector can be used to determine simultaneously the wavelength and the power level of a lightwave signal. The signal wavelength is determined by monitoring the ratio of the two outputs from this photodetector at the crossover of its responsivity curves; the signal level is determined from the sum of the two outputs. Possible applications for this type of photodetector include mode-control of single-frequency injection lasers, direct demodulation for lightwave systems utilising frequency-shift-keyed transmission, wavelength-division multiplexing and optical logic. (7 refs.)
- 113091 Scattering and mode conversion of guided modes by an arbitrary cross-sectional cylindrical object in an optical slab waveguide.** T.Nobuyoshi, N.Morita, N.Kumagai (Dept. of Communication Engng., Osaka Univ., Osaka, Japan). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.374-80 (June 1983). The scattering and mode conversion of guided modes caused by a cylindrical scatterer of arbitrary cross section embedded in, or placed on, a dielectric slab

waveguide are investigated theoretically. The method employed for the analysis is the surface current integral equation technique. The total scattered power, mode-conversion coefficients, and scattering patterns for the typical numerical examples are shown. (21 refs.)

113092 Optical wave propagation in form-birefringent media and waveguides. M.Tateda, T.Kimura (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.402-7 (June 1983). Characteristics of a periodic structure waveguide with a finite width are studied theoretically and numerically. Propagation constants of two orthogonally polarized fundamental modes converge to values which are different from each other, when the total periodic structure width exceeds twice the wavelength. The asymptotic characteristic equation is derived analytically. The normalized frequency V of the high-index layers must be less than unity in order that the optical energy does not localize in the high-index layers. Both the magnitude of the birefringence and the effective refractive index in the form-birefringent media can be controlled by varying the thickness of the high-index layer and the thickness ratio of the high- and low-index materials. (7 refs.)

113093 Numerical field solution for an arbitrary asymmetrical graded-index planar waveguide. V.Ramaswamy, R.K.Lagu (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.408-17 (June 1983). Presents a numerical solution for the field amplitudes in an asymmetrical graded-index planar waveguide with an arbitrary index profile. For small index differences between the surface and bulk indexes and for large differences between the cover and surface indexes, the modes of the diffused waveguides can be described entirely in terms of normalized mode index, diffusion depth, effective modal width, and the V number. The results show a high degree of accuracy when checked against exact published results for the parabolic and exponential index profiles. Universal charts for the modal fields in terms of the normalized quantities are presented for profiles of practical interest, namely, Gaussian and complimentary error function index profiles. It is shown that the modal width, while somewhat sensitive to the V number, is surprisingly insensitive to the index profile. Tailoring of the index profile, therefore, does not seem important for the efficient fibre-waveguide endfire coupling. Error involved in the estimation of the phase shift at the cover-surface boundary as function of the asymmetry parameter is shown to be rather small for practical cases. (29 refs.)

113094 Three-guide optical couplers in GaAs. J.P.Donnelly, N.L.DeMeo, Jr., G.A.Ferrante (Lincoln Lab., MIT, Lexington, MA, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.417-24 (June 1983). Three-guide optical couplers consisting of three 4.75- μ m-wide slab-coupled rib guides separated by 4.25 μ m have been fabricated in GaAs. The performance of these couplers at 1.28 μ m is in close agreement with that predicted using a modified effective-index method to obtain an approximate analytical solution for this type of coupler. The coupling length needed to symmetrically transfer power from the center guide to the two outside guides was 3.2 mm. At this length, less than 1 percent of the power remained in the center guide. The length needed to transfer power from one outside guide to the other outside guide was ≈ 6.4 mm, which is $\approx \sqrt{2}$ times that of a similar two-guide coupler and twice that required to couple power from the center guide to the two outside guides. The power transfer efficiency in this case is not as good as when power was inputted into the center guide. Three-guide couplers of this type should prove useful as power dividers and combiners, especially in cases where waveguide bend losses preclude the use of 'Y'-junctions. They may also prove useful as replacements for two-guide couplers where either sharper transfer characteristics are desired or where losses due to waveguide bends are again unacceptable. (20 refs.)

113095 Optical coupling between single-mode semiconductor lasers and strip waveguides. W.L.Emkey (Bell Labs., Allentown, PA, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.436-43 (June 1983). This analysis describes the optimum conditions for coupling a single-mode semiconductor laser to a single-mode strip waveguide, when both the laser and the waveguide have asymmetric optical beam profiles. The outputs are approximated by two Gaussian fields. Two waveguide cases are treated: (1) the case where the two orthogonal waveguide waists are independent and (2) where the ratio of these waists is fixed. The effect on the coupling efficiency of a spherical surface on the waveguide input face is discussed. The results demonstrate the importance of coupling in the laser far-field and indicate the advantage of having relatively large waveguide modes. An intrinsic minimum in the optimum coupling efficiency was found to exist in the near-field for asymmetric laser/waveguide systems. Expressions describing the optimum waveguide waists and the focal length of the lensed waveguide are given for the waveguide parameters that yield the best coupling conditions. (43 refs.)

113096 Theory of prism coupling with a nonlinear optical waveguide: second harmonic generation. V.V.Malov, A.V.Turovtssev, L.V.Iogansen (All-Union Correspondence Inst. of the Textile & Consumer Industry, Moscow, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.174-9 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.282-91 (Feb. 1983). [received: Sept. 1983]

A theory of resonant tunnel prism coupling with a nonlinear optical waveguide is derived. Approximate analytic solutions are obtained for the amplitudes of the fundamental and second-harmonic waves, and the equations are also solved numerically. It is found that there are two pumping efficiency maxima depending on the width of the beam. It is shown that under optical conditions, when the nonlinear interaction length is comparable to the characteristic coupling length of the waveguide with the prism, the pumping and the conversion efficiencies may exceed 90% and remain high when the beam width varies by a factor $\sim 2-4$. (6 refs.)

113097 Determining the characteristics of Ag:LiTaO₃ diffused optical waveguides. A.K.Angelov, E.M.Zolotov, A.M.Prokhorov, V.A.Chernykh (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.11, p.578-9 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1345-9 (Nov. 1982). [received: Sept. 1983]

Studies the changes in the profile of the refractive index caused by changes in the annealing time. The authors have also calculated the optical field distributions for diffused Ag:LiTaO₃ waveguides. (4 refs.)

42.80M Fibre optics

113098 Characterization of a microlens-ended optical fiber. V.Russo, G.C.Righini, S.Sottini, S.Trigari (Istituto di Ricerca Sulle Onde Elettromagnetiche, CNR, Firenze, Italy).

Alta Freq. (Italy), vol.52, no.3, p.197-9 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).

Lens-ended optical fibers are suitable devices in optical communications and in laser medical applications. The theoretical analysis and the experimental results carried out on two types of microlenses, arc- and bulb-shaped, are reported for multimode step-index fibers. The output characteristics (intensity distribution, focal length, loss) of these fiber ends are described and suggestions for their proper use are given. (7 refs.)

113099 Analysis of differential-mode-delay measurements in optical fibres. G.Coppa, P.di Vita (CSELT, Torino, Italy).

Alta Freq. (Italy), vol.52, no.3, p.203-5 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).

The use of the measurements of differential mode delay (DMD) for the derivation of the index profile dispersion is discussed. The method of processing of DMD measurements, in the case of fibre with non-monotonic index profiles, is described. Finally means to take into account mode conversion are provided. (3 refs.)

113100 Propagating beam analysis of bent optical waveguides. P.Danielson (Electromagnetics Inst., Tech. Univ. of Denmark, Lyngby, Denmark), D.Yevick.

J. Opt. Commun. (Germany), vol.4, no.3, p.94-8 (Sept. 1983).

The propagating beam method is employed to analyze mode coupling in both bent waveguides with a periodic structure and circularly bent waveguides. The results illustrate the physical origin of and provide error estimates for the often-employed method of transforming a circular fiber in an equivalent straight fiber with a modified refractive index profile. (7 refs.)

113101 Review of fiber optic gyroscopes. H.C.Lefevre, Y.Bourbin, P.Graindorge, H.J.Arditty (Central Res. Lab., Thomson-CSF, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.386-94 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The fiber optic gyroscope is now within the high sensitivity predicted by theoretical studies. The authors review the different steps involved in the progress realized over the last five years by the various research teams working on this subject around the world. Measurement of rotation rates of 10^{-2} deg/h have been demonstrated. This corresponds to measurements of phase shift of 10^{-7} rad in this interferometric system, five orders of magnitude better than the earliest results. The first major breakthrough was the detailed analysis of the effects of fiber birefringence and of mechanical stability of the system, using the fundamental principle of reciprocity of model propagation. The need for single mode filtering has led to a so-called minimum reciprocal configuration which improves dramatically the sensitivity of the system when it is used in addition to biasing detection techniques. The authors present the various technological approaches which have been used (bulk optics, all-fiber optics and integrated optics) and analyse the residual parasitic phenomena which had to be reduced (thermal and acoustic noise, Faraday and optical Kerr effects). Experimental data of an all-fiber system and of a brass board using a single multifunction integrated optic circuit are reported. Finally the current problems and the future directions of research which should lead to an actual navigation instrument are discussed. (34 refs.)

113102 Feasibility of fiber optical hydrophone. E.Giese, K.Schatzel, E.O.Schulz-DuBois (Inst. fur Angewandte Phys., Christian-Albrechts-Univ. Kiel, Kiel, Germany).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.408-11 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Pressure induced changes in optical pathlength are being utilized to realize a hydrophone consisting of glass fibers in a Mach-Zehnder interferometric arrangement. In the experimental setup the authors use single-mode fiber optical power dividers and a simple control system that maintains the polarization of both light signals so that interference with constant contrast is obtained after superposition. A modified phase-tracking detection system is used to maintain maximum interferometer sensitivity and a design shown for a sensor-body with high acoustical sensitivity. (2 refs.)

113103 Fiber optic scattering monitor for application on bulk biological tissue, paper, and plastic. P.C.F.Borsboom, J.J.ten Bosch (Materia Tech., Dental School, State Univ. Groningen, Groningen, Netherlands).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.417-21 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A method and apparatus is described to monitor non-destructively the turbidity of near white materials based on edge-losses from a small illuminated area. Measurements are shown on paper and plastic; on teeth during carious demineralization; on the whiteness of the human eyeball and on milk, changing the fat concentration. (2 refs.)

113104 Optical fibre sensors: principles and applications. J.P.Dakin (Plessey Electronic Systems Res. Ltd., Havant, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.429-40 (1983). (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Presents a review of the basic principles of a number of optical fibre sensors with discussion on the advantages and disadvantages of various types. In order to give an overview of what is rapidly becoming a very broad subject, the author has concentrated on the major classes of sensor of practical interest. (32 refs.)

113105 Fitting of a weighted Gaussian lowpass filter to the transfer function of graded-index fibres to reduce bandwidth ambiguities. D.Schickeltanz (Res. Labs., Siemens AG, Muenchen, Germany).

Electron. Lett. (GB), vol.19, no.17, p.650-2 (18 Aug. 1983).

To reduce the ambiguity in the bandwidth value, it is proposed to fit a weighted Gaussian lowpass filter response to the measured transfer function, and to take the bandwidth of this filter as the bandwidth of the fibre. At the same time a correlation value is obtained which may be used to characterise

the difference between the fit and the original transfer function, and to indicate the suitability of the fibre use in concatenated links. (5 refs.)

113106 Joint-loss dependence on mismatch parameters in graded-index optical fibres. G.Coppa, P.Di Vita, U.Rossi (CELT, Torino, Italy). *Electron. Lett. (GB)*, vol.19, no.17, p.654-6 (18 Aug. 1983). The dependence of the mean value and the RMS joint-loss distribution on geometrical and optical parameters is deduced in practical cases by simple and compact formulas. The different sensitivities of the various parameters can suggest different, more advantageous choices of the tolerance set. (4 refs.)

113107 New method for equivalent-step-index fibre for determination. C.Pask, F.Ruhl (Res. School. of Phys. Sci., Australian Nat. Univ., Canberra, Australia). *Electron. Lett. (GB)*, vol.19, no.17, p.658-9 (18 Aug. 1983). Proposes a new method for determining equivalent-step-index fibres; the far-field intensity halfangle is measured for a range of wavelengths and the data fitted by the step-fibre formula. A simple analytical formula aids the analysis. Proven experimental techniques can be used and no Gaussian or other theoretical approximations are involved. (6 refs.)

113108 Optical fibre jacketed with high-modulus low-linear-expansion-coefficient polymer. F.Yamamoto, K.Nakagawa, Y.Shuto, S.Yamakawa (Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan). *Electron. Lett. (GB)*, vol.19, no.17, p.674-5 (18 Aug. 1983). A high Young's modulus, low-linear-expansion-coefficient-polymer loose-jacket optical fibre has been developed using oriented polyoxymethylene (POM), which exhibits Young's moduli 20 to 40 GPa and linear expansion coefficients $\leq 10^{-6}/^{\circ}\text{C}^{-1}$. The highly orientated POM loose-jacket fibre has no microbending losses in a temperature range -60 to 80°C . (3 refs.)

113109 Bend behaviour of polarising optical fibres. M.P.Varnham, D.N.Payne, R.D.Birch, E.J.Tarbox (Dept. of Electronics, Univ. of Southampton, Southampton, England). *Electron. Lett. (GB)*, vol.19, no.17, p.679-80 (18 Aug. 1983). Experimental results are presented which show how both bend radius and the orientation of the fibre in the bend considerably affect the single-polarisation operation of bow-tie fibres. (7 refs.)

113110 Practical single-polarisation anisotropic fibres. A.W.Snyder, F.Ruhl (Inst. of Advanced Studies, Australian Nat. Univ., Canberra, Australia). *Electron. Lett. (GB)*, vol.19, no.17, p.687-8 (18 Aug. 1983). Explains why single-mode single-polarisation operation is possible in practical fibres using less stress-induced birefringence than predicted for ideal anisotropic fibres. Furthermore, the 'leaky-mode' design is shown to be superior to more conventional strategies for single-polarisation operation. (6 refs.)

113111 Comparing the chromatic dispersions of two single-mode silica fibres with pure F and pure GeO_2 doping, respectively. T.Muller, W.E.Heinlein (Univ. Kaiserslautern, Kaiserslautern, Germany). *Electron. Lett. (GB)*, vol.19, no.17, p.692-4 (18 Aug. 1983). The refractive-index profile and the group-delay spectrum of a purely F-doped silica fibre were measured. This fibre's chromatic dispersion behaves considerably differently from that of a purely GeO_2 -doped fibre having the same profile function and V-parameter at $\lambda=0.633 \mu\text{m}$. (5 refs.)

113112 New and simple method for selective mode group excitation in graded-index optical fibres. A.K.Agarwal, G.Evers, U.Unrau (Inst. für Hochfrequenztech., Tech. Univ. Braunschweig, Braunschweig, Germany). *Electron. Lett. (GB)*, vol.19, no.17, p.694-5 (18 Aug. 1983). A modified monomode-fibre offset technique as well as a new and very simple method for selective mode excitation in multimode graded-index fibres is presented. It is shown that an inclined plane wave launch followed by a mandrel-wrap mode filter is a powerful way to excite a definite number of mode groups in graded-index fibres. Besides its extreme simplicity this method yields improved selectivity. Experimental results are presented. (7 refs.)

113113 Constraints for fundamental-mode spot size for broadband dispersion-compensated single-mode fibres. K.Petermann (Forschungsinst., AEG-Telefunken, Ulm, Germany). *Electron. Lett. (GB)*, vol.19, no.18, p.712-14 (1 Sept. 1983). Constraints exist for the fundamental-mode spot size for broadband dispersion-compensated fibres because of the relationship between dispersion and spot size. Dispersion compensation between 1.3 and $1.55 \mu\text{m}$ is still possible with the usual spot radius of about $5 \mu\text{m}$ at $\lambda=1.3 \mu\text{m}$, while dispersion compensation between 1.3 and $1.8 \mu\text{m}$ would require a spot radius of less than $4 \mu\text{m}$. (9 refs.)

113114 Near-field measurements in monomode fibres: determination of chromatic dispersion. G.Coppa, P.Di Vita, M.Potenza, U.Rossi (CELT, Torino, Italy). *Electron. Lett. (GB)*, vol.19, no.18, p.731-3 (1 Sept. 1983). A new dispersion measurement for monomode fibres is proposed. It is based on an elaboration of the near-field intensities at different wavelengths. The measurement is considerably simplified and the results are highly accurate. (5 refs.)

113115 Application of fiber optics to speckle metrology—a feasibility study. T.D.Dudderar (Bell Labs., Murray Hill, NJ, USA), J.A.Gilbert, A.J.Boehnlein, M.E.Schultz. *Exp. Mech. (USA)*, vol.23, no.3, p.289-97 (Sept. 1983). The development of fiber optics provides a potential means of simplifying coherent-light-metrology techniques and, simultaneously, increasing their realms of applicability by suppressing the negative effects of hostile mechanical and thermal environments. Describes a series of experiments which explore some of the possibilities for applying fiber optics to speckle metrology, and, at the same time, demonstrates the use of both photoelectronic-numerical and conventional optical systems for recording and correlating the resulting speckle fields. (20 refs.)

113116 Calculation of stress birefringence in fibers by an infinitesimal element method. R.H.Stolen (Bell Labs., Holmdel, NJ, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.297-301 (June 1983). It is shown that stress birefringence in polarization-preserving fibers can be calculated by the simple addition of contributions from infinitesimal elements of the highly doped stress regions. This method provides insight into the properties of stress-birefringent fibers and shows the equivalence between the various types of such fibers. In particular, it is seen that a circular barrier layer around the core does not reduce the birefringence and that high birefringence does not require a large stress cladding. (16 refs.)

113117 Measurement of the core diameter of multimode graded-index fibers: a comparison of transmitted near-field and index profiling techniques. A.H.Chern, P.J.Rich, S.C.Mettler (Bell Labs., Norcross, GA, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.302-11 (June 1983). The core diameters of six graded-index fibers from four different fiber manufacturers were compared using the transmitted near-field (TNF), the refracted near-field (RNF), and the transverse-interferometric (TI) measurement methods. This study was part of an effort to develop a standardized, industry-wide definition of core diameter and to determine the precision of interlaboratory core-diameter measurements using different measurement techniques. For fibers with smooth index-of-refraction profiles, all three methods were in good agreement ($<1.0\text{-}\mu\text{m}$ difference). Substantial differences between the transmitted near field and the two profiling methods (RNF and TI) were observed for fibers having step structure near the core-cladding boundary. In an attempt to resolve these differences, splice-loss measurements were used as an indicator of diameter differences. These experiments suggested that curve-fitting routines should be applied to the two profiling methods. A comparison of the curve-fitted profile data with measured transmitted near-field data at points 2 percent above the baseline produced values for the diameters which agreed to within $1 \mu\text{m}$ for all of the fibers measured. (5 refs.)

113118 Origins and control of polarization effects in single-mode fibers. S.C.Rashleigh (Naval Res. Lab., Washington, DC, USA). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.312-31 (June 1983). The polarization state of light in single-mode fibers is very sensitive to any perturbation which is not symmetric about the fiber axis. While this is a source of noise, drift, or signal fading in some applications, it can also be exploited in novel guided-wave devices. The basic birefringences that couple the two modes and change the polarization state along the fiber are reviewed. The three cases of uniform, phase-matched, and random coupling are considered. Polarization preservation in both low- and high-birefringence fibers is achieved by reducing this coupling. In addition to polarization-state changes, birefringent fibers can quickly reduce the polarization degree of nonmonochromatic light if both modes are excited, a characteristic that greatly simplifies evaluation of the degree of polarization preservation in these fibers. Current evaluations of the birefringence and the polarization-holding ability of state-of-the-art fibers are discussed, and it is concluded that fibers with good polarization-holding properties are becoming available. (81 refs.)

113119 Analytic solution for the birefringence produced by thermal stress in polarization-maintaining optical fibers. M.P.Varnham, D.N.Payne, A.J.Barlow, R.D.Birch (Dept. of Electronics, Univ. of Southampton, Southampton, England). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.332-9 (June 1983). Polarization-maintaining optical fibers are usually made by inducing a large anisotropic thermal stress in the core so that it appears highly birefringent. A simple analytic solution has been found for the birefringence in terms of the cross-sectional distribution of the high-expansion material used to create the thermal stress. The analysis is able to predict optimal structures which efficiently utilize the available stress and thus maximize the birefringence. It is shown that the optimum structure has a cross-sectional geometry resembling a bow-tie. Design rules are given whereby the dimensions may be chosen and these are verified in a simple experiment. (19 refs.)

113120 Studies on high-tensile proof tests of optical fibers. Y.Miyajima (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.340-6 (June 1983). By conducting high-tensile proof tests on optical fibers in order to eliminate weak points such as cracks or flaws, fiber strength is improved, but fiber length becomes shorter because of fiber breakage during proof tests. When the application is for submarine optical-fiber cables, the upper limit of proof-test strain is determined based on theoretical and experimental studies on fiber strength and fiber length after proof tests. (10 refs.)

113121 Length dependence of bandwidth for fibers with random-axial profile fluctuations. M.Miyamoto, R.Yamauchi, K.Inada (Fujikura Ltd., Chiba, Japan). *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.354-9 (June 1983). Length dependence of bandwidth for graded-index optical fibers with random-axial profile fluctuations is investigated theoretically in connection with optical equalization in long spliced fibers. Based on the statistical approach, a simple analytical formula is derived on the assumption that the profile fluctuation does not cause mode coupling. At a short distance, the bandwidth has been found to be inversely proportional to square root of distance due to the profile fluctuation. The length dependence presents a remarkable contrast to that of the mode-coupling case showing the same dependence at a long distance. (16 refs.)

113122 Design considerations for the structural optimization of a single-mode fiber. K.Kitayama (Electronics Res. Lab., Univ. of California, Berkeley, CA, USA), Y.Kato, M.Ohashi, Y.Ishida, N.Uchida. *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.363-9 (June 1983). Design considerations are made for the structural optimization of single-mode fibers used in high-bit-rate and long-haul transmission systems in the long-wavelength region. As the basic fiber parameters, a combination of the spot size W_0 and the effective cutoff wavelength λ_{ce} is newly chosen, because the combination is found to suitably describe various actual index profiles which deviate from an ideal step-index profile. A procedure to specify the usable range of W_0 and λ_{ce} is established, whereby the overall transmission-line loss in one repeater section is calculated using simple expressions for fiber intrinsic loss, excess loss in the cabling process, and splice loss, etc. The optimum values for a 400 Mbit/s transmission system operating at $1.3 \mu\text{m}$ with a repeater spacing of 20 km are obtained as $W_0=5.0 \pm 0.5 \mu\text{m}$ and $1.1 \mu\text{m} \leq \lambda_{ce} \leq 1.28 \mu\text{m}$, taking into consideration the additional requirement for the possible use at $\lambda=1.55 \mu\text{m}$. (18 refs.)

113123 A single-polarization fiber. J.R.Simpson (Bell Labs., Murray Hill, NJ, USA), R.H.Stolen, F.M.Sears, W.Pleibel, J.B.Macchesney, R.E.Howard. *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.370-4 (June 1983). Reports an optical fiber which guides only one polarization. This fiber polarizes utilizes high modal birefringence (4.7×10^{-4}) to split the two polarizations of the fundamental mode and an elliptical depressed-index cladding to provide a steep wavelength-dependent tunneling loss to the fast axis mode. The stress-induced birefringence is created by an elliptical $\text{SiO}_2\text{-B}_2\text{O}_3$ inner cladding. A 4.7 m length of polarizer fiber exhibits an extinction ratio of 34 dB at a wavelength of 633 nm, with polarizing behavior over a bandwidth of 50 nm. Insertion loss of less than 1 dB has been observed for the guided linear-polarization mode. The polarizing band may be shifted from 620 to 525 nm by bending the fiber to a radius of 0.67 cm. Such fiber polarizers should find a variety of applications in fiber sensors, attenuators, isolators, wavelength filters, and tuners. (12 refs.)

113124 Rayleigh backscattering in a fiber gyroscope with limited coherence sources. W.K.Burns, R.P.Moeller (Naval Res. Lab., Washington, DC, USA).

J. Lightwave Technol. (USA), vol.LT-1, no.2, p.381-16 (June 1983).

Noise due to temporal fluctuations of Rayleigh backscattering light in fiber-optical gyroscopes is studied experimentally with various sources whose coherence length is less than the fiber length. The reduction of the coherent fraction of backscattered light and its fluctuation frequencies with reduced source coherence is demonstrated and fit to an analytical model. Measured backscatter parameters for the fiber and sources used are presented. (11 refs.)

113125 Broad-band ultrasonic sensor based on induced optical phase shifts in single-mode fibers. R.P.De Paula, J.H.Cole, J.A.Bucaro (Naval Res. Lab., Washington, DC, USA).

J. Lightwave Technol. (USA), vol.LT-1, no.2, p.390-3 (June 1983).

A broad-band ultrasonic sensor based on induced optical phase shifts in single-mode fibers (fiber-optic interferometer) is demonstrated over a frequency regime of 0.5-50 MHz. In addition, a recently developed theory used to predict the magnitudes of acoustically induced strains in optical fibers is verified. (9 refs.)

113126 An all fiber-optic sensor for surface acoustic wave measurements. J.E.Bowers (Bell Labs., Holmdel, NJ USA), R.L.Jungerman, B.T.Khuri-Yakub, G.S.Kino.

J. Lightwave Technol. (USA), vol.LT-1, no.2, p.429-36 (June 1983).

A surface acoustic wave (SAW) sensor constructed from single-mode fiber-optical components is described. An analysis of reciprocal and nonreciprocal modes of operation of the sensor is presented. Results from measurements on a variety of SAW devices illustrate the use of the sensor. The amplitude sensitivity is 0.0003 Å for an integration time of 0.1 s. (27 refs.)

113127 Single-mode, single-polarization fibers made of birefringent material. A.W.Snyder, F.Ruhl (Inst. of Advanced Studies, Australian Nat. Univ., Canberra, Australia).

J. Opt. Soc. Am. (USA), vol.73, no.9, p.1165-74 (Sept. 1983).

Optical fibers composed of highly birefringent material are studied. One of the two fundamental modes can be made leaky when the birefringence is sufficiently large. This suggests a novel single-mode, single-polarization fiber design that can be realized by stress-induced birefringence. The leakage rate is calculated by a perturbation method, which accounts for degeneracy between a bound mode and a packet of radiation modes. (27 refs.)

113128 Rayleigh backscattering theory for single-mode optical fibers. M.Nakazawa (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokai, Ibaraki-ken, Japan).

J. Opt. Soc. Am. (USA), vol.73, no.9, p.1175-80 (Sept. 1983).

The theory of backscattering in single-mode optical fibers is described through use of a correlation function for the refractive-index fluctuation in the fiber. A simple formula for the backscattered power is derived using two correlation functions for the Booker-Gordon and Gaussian models. The zeroth-order approximation of the formula, in which the correlation length is much smaller than the spot size of the waveguide mode, coincides with Brinkmeyer's model. The backscattered power at the input end of single-mode fiber is compared with that for multimode fiber. It is also shown that the backscattered power level at the input end is lower by approximately 55 dB than the input power level. (17 refs.)

113129 Information transmission with light. A new transmission medium for a wide range of applications. W.S.Ludolf, E.Gauger.

Mikrowellen Mag. (Germany), vol.8, no.5, p.580-90 (Oct. 1982). In German. [received: Aug. 1983]

This is a tutorial article which discusses the basic principles of light transmission over optical fibres. It discusses such topics as fibre profile-alignment and connectors as well as light loss and optimizing link lengths. (7 refs.) J.R.B.

113130 Fiber-optic temperature sensor. T.Taniuchi, Y.Tsujimoto (Central Res. Lab., Matsushita Electrical Industrial Co. Ltd., Osaka, Japan).

Natl. Tech. Rep. (Japan), vol.29, no.3, p.387-92 (June 1983). In Japanese.

A new optical sensor utilizing temperature variations of birefringence has been developed. A LiTaO₃ single crystal is used as the sensing material, a rutile plate as the polarizer, and an optical fiber as the signal transmission line. The nonmetallic optical sensor components offer electrical noise immunity and high electric insulation. Because a light emitting diode is applied as the light source, this sensor is highly stable and less expensive to manufacture. (9 refs.)

113131 Single-crystal fiber [of CsBr]. Y.Mimura.

Oyo Buturi (Japan), vol.52, no.4, p.311-12 (April 1983). In Japanese.

A fabrication method and characteristics of CsBr single-crystal fibers are described. The minimum loss of the fabricated CsBr fiber was less than 0.1 dB/m at 5.7 μm wavelength. The CsBr fiber shows relatively low loss at 10.6 μm. Therefore, the fiber can be used as a power light guide for CO₂ laser beams. A CsBr fiber with 1 mm diameter is capable of transmitting approximately 50 watts of CO₂ laser beams and has the total power loss of 25 to 30% per meter. (4 refs.) K.B.

113132 Polycrystalline infrared optical fibers. M.Kimura, S.Kachi, K.Shioyama.

Oyo Buturi (Japan), vol.52, no.4, p.313-14 (April 1983). In Japanese.

A fabrication method and transmission characteristics of polycrystalline optical fibers are presented. The materials applicable to these fibers include KCl, AgCl, AgBr and KRS-5. These materials are characterized by their low melting point. The fabrication method is capable of preventing the transmission loss of fibers from being increased by fabrication conditions. The transmission loss for 10.6-μm CO₂ laser beams was 0.25 dB/m for a KRS-5 fiber with 1.0 mm diameter. The numerical aperture of laser beam incidence to the fiber was as small as 0.01. The loss measurement using a CO₂ laser source showed 1.2 dB/m loss at 10.6 μm. This large loss resulted from scattering loss due to bad fiber-surface condition. (6 refs.) K.B.

113133 Fluoride glass fiber. T.Miyashita.

Oyo Buturi (Japan), vol.52, no.4, p.315-6 (April 1983). In Japanese.

The possible transmission loss of fluoride glass optical fibers may be about 10⁻³ dB per kilometer. The suitable material for implementing low-loss fibers is ZrF₄-BaF₂-GdF₃ glass. At the present time the lowest loss is 12 dB/km at 2.55 μm. A transmission loss of less than 3 dB/m is at wavelengths from 0.5 to 4.6 μm. For low-loss fiber-fabrication to be implemented, the impurity contents should be reduced from the present ppm level (10⁻⁶) to a ppb level (10⁻⁹). (6 refs.) K.B.

113134 Soliton analysis with the propagating beam method. D.Yevick, B.Hermansson (Inst. of Optical Res., Stockholm, Sweden).

Opt. Commun. (Netherlands), vol.47, no.2, p.101-6 (15 Aug. 1983).

It is demonstrated that the propagating beam method can be employed to determine the behavior of optical fiber solitons in the presence of optical loss, third order dispersion and fifth order nonlinearity. Using the method, the authors analyze and extend analytical and numerical results of other authors,

concentrating principally on calculations involving $N=3$ solitons. The results demonstrate that in fibers with large third order dispersion, only the lowest-order solitons should be excited in communication applications. (8 refs.)

113135 Spatial filtering of backscattering signal in optical fibers. M.Biet (Thomas-CSF, Lab. de Recherches, Orsay, France).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1163-4 (Sept. 1983).

Reducing the front face echo is one of the major problems encountered in backscattering measurements of optical fibers. A simple method is proposed in order to eliminate completely this unwanted signal for both multimode and single-mode fibers. The setup is very simple and no special preparation of the fiber is needed. The insertion losses of the filtering device are very low and the detector is protected against direct reflections. In the case of multimode fibers a selective analysis of the backscattered signal can be performed. (10 refs.)

113136 Plug connectors for fiber-optic waveguide systems and components. G.Knoblauch (Siemens AG, Munchen, Germany), H.-N.Toussaint.

Siemens Components (Engl. Ed.) (Germany), vol.18, no.3, p.81-6 (June 1983).

Discusses plug connections on optical transmission paths that serve to interlink two fiber-optic waveguide components in a simple and reproducible manner with low loss and, if necessary, in such a way that the components can be disconnected easily. Components covered by this definition include lines, filters, and junction boxes in addition to optoelectronic converters at the transmission and reception side. Various requirements are made of the mechanical tolerances of the plug connectors dependent upon the core diameter of the fibers used and the required insertion loss of the plug connection. However, the resultant insertion loss of a plug connection is highly dependent upon the fiber tolerances. (no refs.)

113137 Strength assurance of optical fiber based on screening test. Y.Mitsunaga, Y.Katsuyama, H.Kobayashi, Y.Ishida (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.J66B, no.7, p.829-36 (July 1983). In Japanese.

The author describes a long-term assurance method of optical fiber strength based on the screening test. General equations for assurance, which are applicable for various environmental and strain conditions are derived theoretically. Fatigue and strength distribution parameters of fibers contained in the equations are quantitatively evaluated from test data, and an allowable failure ratio is determined considering the transmission system reliability. Using the derived equations and the determined parameter values, the required screening test condition for reliability assurance of the optical fiber is clarified in relation to the strain applied to the fiber for long period. (8 refs.)

113138 Fényvezető uvegcsalak a tavkozlesben (Light propagation in optical fibres). I.Kosa Somogyi.

Report KFKI-1983-75, Hungarian Acad. Sci., Budapest (1983), 16 pp. In Hungarian.

A short survey is given of the light propagation in optical fibres and the different technologies for their production. (15 refs.)

113139 A fibre optic displacement sensor. H.Sohlstrom, U.Holm (Instrumentation Lab., Royal Inst. of Technol., Stockholm, Sweden).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.183-92 vol.1

Different sensor principles are first outlined. A displacement sensor using multimode, step index fibres is described. Measurement data showing a resolution of 0.05 nm/√Hz in a 150 μm linear range is given. In this sensor, the light coupling between two fibre ends varies with the position of a movable mirror. A mathematical model of the sensor is presented. Application to pressure sensing is also discussed. (9 refs.)

113140 Portable real-time coherent optical correlator. J.Upatnieks (Infrared & Optics Div., Environmental Res. Inst. of Michigan, Ann Arbor, MI, USA).

Appl. Opt. (USA), vol.22, no.18, p.2798-803 (15 Sept. 1983).

A real-time coherent optical correlator is mounted inside a 15-×23-×38-cm enclosure and features laser diode light sources and a liquid crystal incoherent-to-coherent image converter. Each of four reference filters is illuminated by a separate laser diode, real-time operation is achieved by the image converter, and a zoom lens forming the incoherent image allows a scale search. The correlator can be mounted on a tripod and performs correlations indoors or outdoors. (11 refs.)

113141 AGA infrared techniques. H.Schachinger (AGA-IRS Internat. GmbH, Wien, Austria). *Finomtech.-Mikrotech. (Hungary)*, vol.22, no.5, p.129-34 (May 1983). In Hungarian.

Grounds of measurements based on the perception of infrared radiation and alternatives of its application are reported. This paper is addressed to experts who intend to get acquainted with the physical and technical bases of the method (called also thermography) in order to pick up subjects for which this method provide for technical-scientific or economical advantages. (no refs.)

113142 Infra-red image sensing and conversion into visible light. N.R.Mantena (Electronic Watch Div., Hindustan Machine Tools Ltd., Bangalore, India). *J. Inst. Electron. & Telecommun. Eng. (India)*, vol.29, no.2, p.71-6 (Feb. 1983).

An integrated circuit configuration consisting of an operational amplifier with metal insulator semiconductor transistors coupled to a *pn* junction photovoltaic detector and a feedback diode is proposed for fabricating integrated arrays which will form the image-sensor mosaic. The output of this array can be used to drive the mosaic panel of electroluminescent diodes, either directly or through scanning type of system in order to obtain a visible output which is a replica of the infra-red signal at the input. Using the present-day IC technology, it should be possible to fabricate compact all-solid-state infra-red sensors and converters for use in binocular type of viewing by the nightglow. Experimental data on the devices required for integration of a unit-cell detector-amplifier system are presented. For the system proposed for infra-red image sensing and conversion into visible light, an analysis of the system time constant is presented, and, it is shown that a system time constant of 0.1 sec or less can be obtained by the integrated system proposed here. On the basis of this analysis, an integrated format was selected and preliminary integrated circuits were fabricated which were close to meeting parameters of the system design. This system has a good application in the nightviewing of slow to medium-speed objects with the help of nightlight reflections. (8 refs.)

113143 Simple synchronous video image combiner. A.L.V.S.Lage, A.O.S.Gomes, O.D.D.Souares (Centro de Fisica, Univ. do Porto, Porto, Portugal). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1248-50 (Sept. 1983).

A simple and inexpensive TV camera image combiner for several purposes in current video dual image acquisition is described. (3 refs.)

113144 Adaptive randomized detector of optical signals. R.G.Tolparyev, E.V.Borisov. *Telecommun. & Radio Eng. Part 2 (USA)*, vol.37, no.9, p.113-15 (Sept. 1982). Translation of: *Radiotekhnika, Moskva (USSR)*, vol.37, no.9, p.77-9 (Sept. 1982).

A practical circuit and operating algorithm of an optical signal detector with randomized decision rule are described. (1 ref.)

42.80S Optical communications devices

113145 Optical comms: system elements reviewed. J.Williamson. *Commun. Eng. Int. (GB)*, vol.5, no.2, p.15-22 (April 1983).

Surveys recent developments in fibre optic systems. In addition to main system components, some aspects of manufacturing, installation and testing are included. The basic elements of an optical fibre communication system are the dielectric waveguide, optical sources and optical detectors. Signal processing devices like wavelength division multiplexers also find application in optical systems. (no refs.)

113146 Physical obstacles to optical communications. J.Williamson. *Commun. Eng. Int. (GB)*, vol.5, no.2, p.23-9 (April 1983).

Optical fibre manufacture using vapour phase processes is briefly discussed. To maintain comprehensive quality control a measuring system from Vickers Instruments is available. In the majority of commercially available systems, the demountable coupling of fibres is accomplished by precisely aligning the two prepared fibre ends in a mechanical connector. Some of the most popular mechanical connector systems are reviewed. (no refs.)

113147 Light fantastic and light fact [fibre optic communication]. J.Williamson. *Commun. Eng. Int. (GB)*, vol.5, no.2, p.30-5 (April 1983).

Presents an account of the main application areas for optical fibre communication systems. The most obvious candidate for the early deployment of optical transmission systems is the public switched telephone network. Contention channel type local area networks (LAN) are difficult to implement with optical fibre since the signal losses which occur at each tap exert an inhibiting effect on system length and tap number. A number of other market areas exist such as the military and television. (no refs.)

113148 Low-loss wavelength division multiplexing (WDMK) devices for single-mode systems. J.Lipson (Bell Telephone Labs. Inc., Allentown, PA, USA), G.T.Harvey. *J. Lightwave Technol. (USA)*, vol.LT-1, no.2, p.387-90 (June 1983).
